14. An air-ship illusion comprising a rotating tower, an elevator-car, means on the tower for raising and lowering the elevator-car, and an imitation-air-ship structure secured to each car and apparently supporting it, substantially as described.

15. An air-ship illusion comprising a rotating tower, an elevator-car, means on the tower for raising and lowering the elevator-car, an imitation-air-ship structure secured to each car and apparently supporting it, and rotary propellers connected with the air-ship structure and apparently driving it, substantially as described.

16. An air-ship illusion comprising a rotary tower, an elevator-car, means on the tower for raising and lowering the elevator-car, means for cutting off the tower from the view of the passengers within the car, and an imitation-air-ship structure secured to the car and apparently supporting it, substantially as described.

17. An air-ship illusion comprising a rotary tower, an elevator-car, means on the tower for raising and lowering the elevator-car, means for cutting off the tower from the view of the passengers within the car, an imitation-air-ship structure secured to the car and apparently supporting it, and rotary propellers connected to the air-ship structure and apparently driving it, substantially as described.

18. An air-ship illusion comprising a rotary tower, an elevator-car, means on the tower for raising and lowering the elevator-car, means for cutting off the tower from the view of the passengers within the car, an imitation-air-ship structure secured to the car and apparently supporting it, and propellers mounted on the car and apparently driving it, and means for rotating the propellers from the rising and falling movement of the car, substantially as described.

19. An air-ship illusion comprising a rotating tower, an elevator-car, means for moving the car up and down on the tower, propellers mounted on the car and apparently driving it, guide-wheels on the car rotatively engaging guides on the tower, and connection between said propellers and guides for rotating the propellers when the car is moved on the tower, substantially as described.

20. The combination with a tower, of elevator-cars arranged in a plurality of sets of two cars each, the two sets of cars being connected together to counterbalance each other, and means for simultaneously raising one set of cars and lowering the other set, substantially as described.

21. The combination with a tower, of elevator-cars arranged in a plurality of sets of two cars each, the two sets of cars being connected together to counterbalance each other, and the two cars of each set being arranged on opposite sides of the tower from each other, and means for simultaneously raising one set of cars and lowering the other set, substantially as described.

22. The combination with a tower, of elevator-cars arranged in a plurality of sets of two cars each, the two sets of cars being connected together to counterbalance each other by cables which connect each car of each set with both cars of the other set, and means for simultaneously raising one set of cars and lowering the other set, substantially as described.

23. The combination with a tower, of elevator-cars arranged in a plurality of sets of two cars each, the two sets of cars being connected together to counterbalance each other by cables which connect each car of each set with both cars of the other set, the two cars of each set being arranged on opposite sides of the tower from each other, and means for simultaneously raising one set of cars and lowering the other set, substantially as described.

24. The combination with a rotating tower, of elevator-cars arranged in a plurality of sets of two cars each, the two sets of cars being connected together to counterbalance each other, and the two cars of each set being arranged on opposite sides of the tower from each other, means for simultaneously raising one set of cars and lowering the other set, and a rotating platform from which the cars may be loaded and unloaded without stopping the tower, substantially as described.

25. The combination with a rotating tower, of elevator-cars arranged in a plurality of sets of two cars each, the two sets of cars being connected together to counterbalance each other by cables which connect each set with both cars of the other set, means for simultaneously raising one set of cars and lowering the other set, and a rotating platform from which the cars may be loaded and unloaded without stopping the tower, substantially as described.

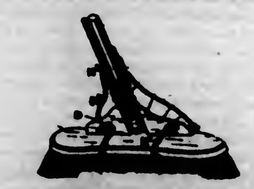
26. The combination with a rotating tower, of elevator-cars arranged in a plurality of sets of two cars each, the two sets of cars being connected together to counterbalance each other by cables which connect each car of each set with both the cars of the other set, the two cars of each set being arranged on opposite sides of the tower from each other, means for simultaneously raising one set of cars and lowering the other set, and a rotating platform from which the cars may be loaded and unloaded without stopping the tower, substantially as described.

27. The combination with a tower, of elevator-cars arranged in a plurality of sets of two cars each, the two sets of cars being connected together to counterbalance each other by cables which connect each car of each set with both cars of the other set, said cables passing over vertical sheaves at the top of the tower, and each making a quarter-turn around a horizontal sheave at the top of the tower between the vertical sheaves, and means for simultaneously raising one set of cars and lowering the other set, substantially as described.

28. In an apparatus of the class described, the combination of a rotary tower, a carriage on its exterior, means for simultaneously rotating the tower and moving the carriage up and down thereon, said carriage having its front open and its walls adapted to obscure a view by the passengers of the tower and the operating mechanism.

29. In combination, a tower, a plurality of observation-carriages mounted on the exterior of the tower, means for simultaneously rotating the tower and moving the carriages up and down the tower, said carriages having open fronts and opaque back walls, whereby the tower and the operating mechanism are obscured from the sight of the passengers, for the purpose set forth.

818,550. **COMBINED BRUSH AND HOP HOLDER.** EDWARD B. GILBERT, Galt, Canada, assignor to Arthur Frederick Hatch, Toronto, Canada. Filed July 20, 1905. Serial No. 271,694.



Claim.—1. In a holder of the class described, the combination with a handle having a main plate secured thereto, a lever and a spring located between the lever and main plate, of a hooked loop extending from the rear of the main plate and movably connected thereto and a hooked grasping-loop extending from the front of said main plate and actuated by said lever, as and for the purpose specified.

2. In a holder of the class described, the combination with a handle, main plate, lever and spring, of a hooked loop extending rearwardly from and pivoted to the main plate, and a hooked grasping-loop having extending arms passing through the front portion of said main plate and pivoted at their ends to the said lever, as and for the purpose specified.

818,551. **GAME-REGISTER.** GUSTAVE F. GOSS, Wallaceton, Pa., and JOHN H. PARKER, Washington, D. C.; said Parker assignor to said Goss. Filed May 27, 1904. Serial No. 210,161.

Claim.—1. In a pool-game recorder, the combination with independent receptacles in which the balls are received and retained, of an independent printing mechanism for each receptacle, and means for automatically operating said printing mechanism on the pocketing of each ball.

2. In combination with receptacles for pool-balls, of means for making a separate record of the number of balls entering and retained in each receptacle.

3. The combination with separate receptacles for the balls pocketed by different players, of means for recording the number of balls entering and removed from each receptacle, said records being printed in independent parallel columns.

4. The combination with separate receptacles for the balls of different players, of means for indicating the number of balls entering and removed from each receptacle.

5. The combination with a plurality of ball-receptacles, of independent recording means for each receptacle, and automatic mechanism for imprinting the charge for the game in the column in which the lowest number of balls is recorded.

6. The combination with a pool-table, of means for keeping a record of the balls pocketed by each player, and automatic mechanism for recording the charge for each game in the column recording the lowest number of balls.

7. The combination with a pool-table, having a plurality of receptacles for the balls pocketed by different players, of a ball-operated means for automatically recording in separate columns the number of balls pocketed by each player, and ball-operated means for recording in said columns the number of balls removed from the receptacles.

8. The combination with a pool-table, a ball-operated imprinting mechanism for keeping separate records of the balls pocketed by each player, and means for automatically imprinting the charge for each game in alinement with the record of the lowest number of balls.

9. The combination with a pool-table, of a plurality of ball-receiving compartments, and means for recording the number of balls entering and retained in each compartment.

10. In recording mechanism, means for making independent records in separate columns, and automatic mechanism for imprinting a distinguishing-mark in the column having the smallest record.

11. In recording mechanism for pool-tables, means for automatically registering in independent columns the number of balls made by the individual players, and means for automatically printing in one of the columns the amount due for each game.

12. In recording mechanisms, means for keeping independent records in different columns, a plurality of mechanisms arranged for the printing of predetermined characters, one of said printing means being located opposite each column, and means controlled by the independent recording means for automatically selecting the printing means to be operated.

13. The combination with recording means, for keeping independent records in independent columns, of an automatically-selected printing means controlled by the independent recording means for printing a predetermined character in one of them.

14. In a recorder, means for maintaining independent records in independent columns, and an adjustable imprinting means controlled by the independent recording means for printing a distinguishing character in one of such columns.

15. In combination with means for maintaining independent records in independent columns, of an adjustable means for printing a distinguishing character in one of them, and means controlled by the independent recording means for automatically determining the column in which such character is to be printed.

16. The combination with means for keeping independent records in independent columns, of a plurality of type-disks arranged one opposite each column and bearing type representing different values, and means controllable by the independent recording means for determining the operative type-disk.

17. The combination with means for keeping independent records in independent columns, of a plurality of type-disks each bearing type representing different values and a selecting means controllable by the independent recording devices for determining the operative type-disks.

18. The combination with means for maintaining independent records in independent columns, of a plurality of type-disks bearing numerals of different values, said disks being simultaneously adjustable to present any of the type to imprinting position and means controllable by the independent recording devices for determining the operative type-disk.

19. The combination with a platen, of means for printing independent records in independent columns, a plurality of type-disks bearing numerals of different values, the said disks being simultaneously adjustable to present any one set of numerals in alinement with the platen, and a selecting means controllable by the independent recording means for operating the type-disk opposite the recording mechanism which has been operated the fewest number of times.

20. The combination with means for maintaining independent records in independent columns, of a rheostat for each of such mechanisms, means controlled by said mechanisms for cutting in resistance to an extent proportionate to the number of operations of the recording mechanisms, type-disks for printing the final distinguishing character in one of the columns and an imprinting means coacting with said type and including an electromagnet and a circuit connecting such electromagnet to all of the rheostats.

21. The combination with a plurality of electromagnets arranged in independent circuits, an imprinting device for each electromagnet, a rheostat arranged in connection with each electromagnet, a contact-arm forming a part of the rheostat and operable by the electromagnet to successively cut in resistance each time the mechanism is operated, a plurality of final imprinting mechanisms, independent electromagnets for actuating them, and a circuit including the rheostats, the second set of magnets and a source of electrical energy.

22. The combination with a series of electromagnets, of an imprinting device for each electromagnet, a rheostat, a contact-arm forming a part of the rheostat, and operable by the electromagnet to successively cut in resistance in proportion to the number of times the electromagnet is energized, there being one of such imprinting mechanisms and rheostats for each of the electromagnets, a second series of electromagnets each serially connected with one of the rheostats, and an electric circuit having multiple connection with the several series circuits.

23. The combination of a plurality of independent electromagnets arranged in ball-operated circuits, of an imprinting mechanism for each electromagnet, a rheostat associated with each electromagnet, a ratchet-wheel and operating-pawl connected to the arma-

ture of the electromagnet, a rheostat contact-arm movable with the ratchet-wheel and operating to successively cut in resistance in proportion to the number of operations of the electromagnets, and means controllable by a scratch-ball for temporarily releasing the pawl and permitting reverse movement of the wheel and contact-arm.

24. The combination with a plurality of independent electromagnets arranged in ball-controlled circuits, a ball-receptacle, an imprinting mechanism operable by each of the electromagnets, a rheostat associated with each electromagnet, a rheostat contact-arm, a ratchet-wheel connected thereto, a pawl connected to the armature of the electromagnet, and engaging said ratchet-wheel, a spring tending to restore the ratchet-wheel to initial position, a second set of energized electromagnets, an imprinting mechanism for each of the second set of electromagnets, the circuits of said second set of electromagnets being controlled by balls removed from the receptacle, and means operable by said second set of electromagnets for raising the pawls and permitting reverse movement of the ratchet-wheel and contact-arms of each receptacle each time a ball is removed from said receptacle.

25. The combination with a ball-receptacle, of a plurality of independent electromagnets arranged in ball-controlled circuits, an imprinting mechanism for each electromagnet, a rheostat associated with each electromagnet, a rheostat contact-arm for successively cutting in resistance each time the electromagnet is energized, a ratchet-wheel carrying said contact-arm, a spring tending to reverse the movement of the ratchet-wheel, a pawl engaging the ratchet-wheel and connected to the armature of the electromagnet, a second set of electromagnets, independent circuits in which said electromagnets are arranged, said independent circuits being controllable by the removal of balls from the receptacle, an imprinting mechanism for each of the second set of electromagnets and an escapement mechanism controllable by said second set of electromagnets for releasing the pawl and permitting reverse movement of the ratchet-wheel and contact-arm of each receptacle each time a ball is removed from the receptacle.

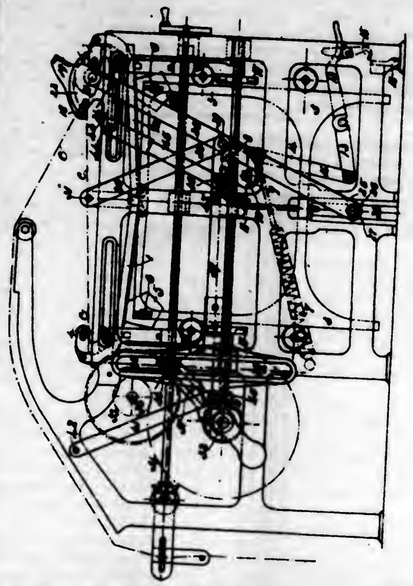
26. The combination with a ball-receptacle, of a plurality of electromagnets connected in independent ball-controlled circuits, an imprinting mechanism for each electromagnet, a rheostat associated with each electromagnet, a rheostat contact-arm for successively cutting in resistance each time the electromagnet is energized, a ratchet-wheel carrying said contact-arm, a pawl engaging the ratchet-wheel and operable by the electromagnet, a second set of electromagnets, imprinting-type operable thereby for printing in a selected column a mark or symbol designating the loser of the game, said electromagnets being each connected in series with one of the rheostats, an electric circuit having a multiple connection with the series circuits, and an auxiliary circuit controlled on the final imprinting means for raising all of the pawls and permitting movement of the parts to initial position.

27. The combination with a pool-table, of a series of independent ball-receptacles, a plurality of concentric shafts, projecting arms carried by the shaft and extending into the receptacles in the path of the balls, type-disks connected one to each of the shafts and receiving movement on the entrance of each ball, and an imprinting means operable on the removal of the balls to imprint the number of balls remaining in each receptacle.

28. The combination with a pool-table, of a series of independent receptacles, a plurality of concentric shafts, radial arms extending from the shaft and projecting into the receptacles in the path of the entering balls, pinions secured to the shaft, independent gears one in mesh with each pinion, type-disks carried by the gears, a stop-wheel having a plurality of peripheral recesses, one of such stop-wheels being connected to each type-disk, springs for restoring the type-disks to initial position, pins for entering the recesses of the stop-wheels, and an elongated tooth carried by each of the stop-wheels for engaging said pin, an impression-hammer operable on the movement of the receptacle for printing a record of the position of the type-disks at the conclusion of the game, and means operable by movement of the impression-hammer for moving the pins outward from engagement with the stop-wheels.

813,552. CLOTH-FOLDING MACHINE. WILLIAM H. HASKINS, Bury, England. Filed Sept. 26, 1904. Serial No. 225,073.

Claim.—1. In a cloth-folding machine the combination of alternately-acting clamps means for operating them a table normally pressed upward against said clamps reciprocating folding-blades an oscillating carrier for said blades means for oscillating said carrier about its axis in a side arm a side arm having a rising and falling fulcrum a connecting-rod having a transverse slot a crank engaging with said slot and two parallel radius-rods suspending and supporting said connecting-rod and side arm substantially as and for the purpose set forth and shown.



2. In a cloth-folding machine the combination of alternately-acting clamps means for operating them a table normally pressed upward against said clamps a reciprocating side arm a crank and connecting-rod for operating said side arm an oscillating blade-carrier journaled in said side arm a toothed segment concentric therewith a toothed segment eccentric thereto engaging with the concentric segment and a controlling-rod between said eccentric segment and the connecting-rod and having a variable point of attachment to the latter substantially as and for the purpose set forth and shown.

3. In a cloth-folding machine the combination of cloth-folding blades mounted in a carrier on a side arm, means for oscillating said carrier and imparting a reciprocating rectilinear motion thereto from side to side, alternately-acting clamps and means for operating them, a table having leaves hinged or so mounted that they can be raised or lowered so as to form a table of variable concavity, supports by which the leaves are maintained in their various positions of adjustment independent of the means for pressing the table upward against said clamps substantially as and for the purpose set forth.

4. In a cloth-folding machine, the combination of cloth-folding blades, mounted in a carrier on a side arm, with means for oscillating and reciprocating the said carrier, a table having leaves adapted to be independently tilted, rotatable supporting devices arranged under the said leaves individually and each having operative faces at varying radial distances from its axis, for adjusting the inclination of said leaves and holding each leaf in the position to which it is thus adjusted, clamps acting alternately on the cloth which is supported by the said table, means for actuating the said clamps and means for normally bringing the said table and clamps together substantially as set forth.

813,553. STANDARD FOR DESK-CALENDARS. FRANK A. HALE, Chicago, Ill. Filed May 24, 1905. Serial No. 262,267.

Claim.—1. In a device of the kind described, in combination, a base having a socket; an arch having one leg seated in the socket; and means bearing laterally on the other leg of the arch to cause the first-named leg to frictionally engage the walls of the socket.

2. In a device of the kind described, in combination, a base having a socket; an arch having one leg seated in the socket; and a lever bearing laterally on the other leg of the arch.

3. In a device of the kind described, in combination, a base having a pair of sockets; a pair of arches formed of a single rod, the ends of the rod forming one leg of each arch and being seated in the sockets; and a lever bearing laterally on the arch-connecting portion of the rod.

4. In a device of the kind described, in combination, a base having a pair of sockets; a pair of arches formed of a single rod, the ends of the rod forming one leg of each arch and being seated in the sockets; and a lever bearing laterally and downwardly on the arch-connecting portion of the rod.

5. In a device of the kind described, in combination, a base having a pair of sockets; a pair of arches formed of a single rod, the ends of the rod forming one leg of each arch and being seated in the sockets; and a lever bearing downwardly on the arch-connecting portion of the rod.

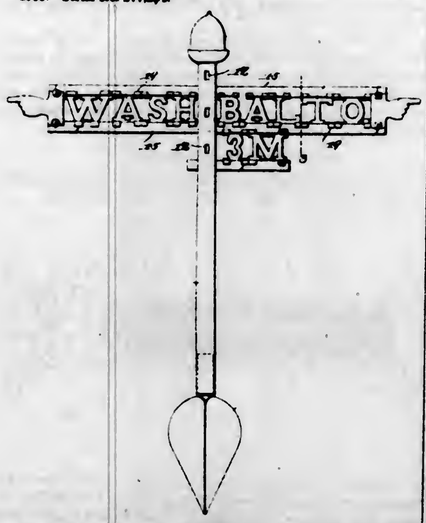
6. In a device of the kind described, in combination, a base having a pair of sockets; a pair of arches formed of a single rod, the ends of the rod forming one leg of each arch and being seated in the sockets; and a lever pivoted to the base and having a cam-shoulder adapted to bear laterally on the arch-connecting portion of the rod.

7. In a device of the kind described, in combination, a base having a pair of sockets; a pair of arches formed of a single rod, the ends of the rod forming one leg of each arch and being seated in the sockets; and a lever pivoted to the base and having a cam-shoulder adapted to bear laterally on the arch-connecting portion of the bar, and having a flange projecting forwardly from the shoulder to engage the top of said portion of the rod.

8. In a device of the kind described, in combination, a base having a socket; an arch having one leg seated in the socket; and means bearing laterally on the arch for causing the leg to frictionally engage the socket.

9. In a device of the kind described, a base having a socket, an arch mounted on the base and having one leg seated in the socket, the leg frictionally engaging the walls of the socket to secure the arch to the base.

813,554. SIGN. LOUIS C. HAMEL, Appleton, Wis. Filed Sept. 6, 1905. Serial No. 277,234.



Claim.—1. In a sign, a hollow column, arms extending through and outstanding perpendicular to the column, and means internally of the column for securing the arms against displacement.

2. In a sign, a hollow column, arms extending through and outstanding from the column, and means within and longitudinally movable relative to the column for securing the arms against displacement.

3. In a sign, a hollow column, arms inserted through and extending upon opposite sides of the column, and means within the column to prevent displacement of the arms.

4. In a sign, a hollow column, arms inserted through and extending upon opposite sides of the column, binding means within the column and in engagement with the arms, and means for exerting pressure upon the binding means.

5. In a sign, a hollow column, arms inserted through and extending upon opposite sides of the column, binding means mounted and longitudinally movable within the column and in engagement with the arms, and means external of the column for exerting a pressure upon the binding means.

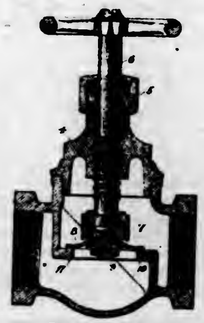
6. In a sign, a hollow column having openings formed therethrough, a binding member within the column and having openings registering with the openings in the column, arms inserted through the openings and means for exerting a pressure upon the upper end of the binding member.

7. In a sign, a hollow column having openings formed therethrough, a cylindrical binding member mounted and longitudinally movable within the column and having openings registering with the openings in the column arms, inserted through the openings and means for exerting pressure upon the upper end of the binding member.

8. The combination with a column having outstanding parallel arms of characters composed of sheet material and having opposite ends slitted and the lips so formed bent to opposite sides to embrace the arms.

9. The combination with a hollow column having parallel arms inserted and longitudinally movable therethrough of characters composed of sheet material equal in height to the distance between the arms and having lips upon the top and bottom formed by slits and bending the lips laterally alternately in opposite directions and terminating in portions parallel with the characters and spaced apart and embracing one edge of each arm.

813,555. SPRING-DISK VALVE. JAMES T. HAYDEN, Chicago, Ill., assignor to Crane Company, Chicago, Ill., a Corporation of Illinois. Filed Apr. 13, 1905. Serial No. 255,457.



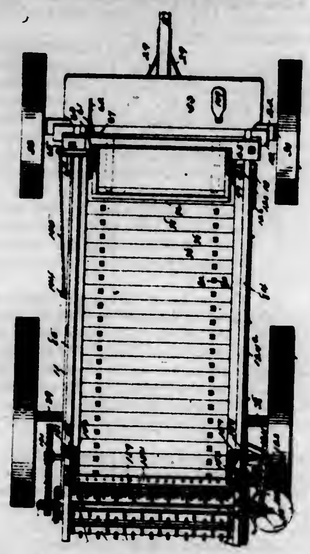
Claim.—1. In a valve the combination with a valve seat comprising a groove having a flat surface and a circumferential surface, and a valve having means to expand laterally against the circumferential surface when pressed downward upon the flat surface of the seat.

2. In a valve the combination of a spring disk valve of concaved form and made of soft metal, and a valve seat of hard metal having means to engage the edges of the disk on several surfaces thereof, whereby the downward pressure of the disk on the seat will cause it to spread radially to engage the seat in both vertical and horizontal direction, substantially as described.

3. The combination of a valve seat comprising a circumferential groove, and a valve comprising a concave disk, the stem of the valve being attached to the higher part or center of the disk, and adapted to spread the disk at its edges by downward pressure on the disk, so that it engages two surfaces of the groove.

4. In a valve the combination with a valve seat comprising a circumferential groove, and a parti-spherical valve disk of softer metal, adapted to be spread by the pressure thereon and engage the seating groove on two of its surfaces, substantially as described.

813,556. FERTILIZER-DISTRIBUTER. JOHN M. HINE, Grundy Center, Iowa. Filed July 25, 1904. Serial No. 217,893.



Claim.—1. A fertilizer-distributer comprising a traction-truck, a rake driven by said truck, an apron driven by said rake in one direction, yielding pressure devices for returning the apron to its initial position and mechanism operated by the apron, to suspend the operation of its driving mechanism.

2. A fertilizer-distributer comprising a traction-truck, a revolving rake, driving connections between said truck and rake, manually-operated devices for establishing said driving connections, automatically-operated devices for suspending said driving connections, an apron driven in one direction by said rake, and yielding pressure devices for returning said apron to its initial position.

3. A fertilizer-distributer comprising a traction-truck, a revolving rake, suspendable driving connections between the truck and rake, an apron mounted for travel beneath said rake, suspendable driving connections between the apron and rake, and means exerting a yielding pressure upon the apron to retard its movement from and automatically return it to its normal position.

4. A fertilizer-distributer comprising a traction-truck, a revolving rake, suspendable driving connections between said traction-truck and rake, an apron mounted for travel beneath said rake, friction-gearing connecting said rake and apron, means for suspending travel of the apron independently of the movement of the rake, and springs for reversing the travel of the apron to return it to its normal position.

5. A fertilizer-distributer, comprising a traction-truck, a revolving rake, driving connections between said truck and rake, manually-operated devices for establishing said driving connections, automatically-operated devices for suspending said driving connections, an apron mounted for travel beneath said rake, driving connections between said rake and apron, pedally-operated releasing mechanism for suspending the driving connections between the rake and apron, and yielding pressure devices for returning said apron to its initial position.

6. A fertilizer-distributer comprising a traction-truck, a rake, driving connections between the truck and rake, manually-operated devices for establishing said connections, means for automatically suspending said connections, an apron movably mounted beneath the rake, driving connections between the rake and one end of the apron, and a spring for automatically returning the apron to its initial position.

7. In a machine of the class described, an apron, a drum-shaft mounted for rotation beneath the rear end of said apron, a drum loosely mounted on said shaft, a cable connected to the forward end of said apron and adapted to be wound on said drum and clutch connections between said drum-shaft and drum.

8. In a machine of the class described, an apron, a drum-shaft mounted for rotation beneath the rear end of said apron, a drum on said shaft, a cable attached at one end to the forward end of said apron and adapted to be wound on said drum, another drum-shaft, a cable attached to the forward end of said apron and adapted to be wound on the second drum-shaft, and spring-resisted cables adapted to be wound on the second drum-shaft in opposition to the second cable.

9. In a machine of the class described, an apron, drum-shafts at either end of said apron, cables attached to the forward end of the apron and adapted to be wound on said drum-shafts oppositely, spring-returning cables adapted to be wound on one drum-shaft in opposition to the other cable wound thereon, and a cable sustaining the tail end of said apron at times.

10. In a machine of the class described, an apron, means for driving said apron in one direction, springs for returning said apron to its initial position and mechanism, operated by the apron, to suspend the driving mechanism.

11. In a machine of the class described, an apron, mechanism for driving said apron in one direction, springs for returning said apron to its initial position, and pedal-operated mechanism for suspending the driving mechanism and establishing the spring-returning function.

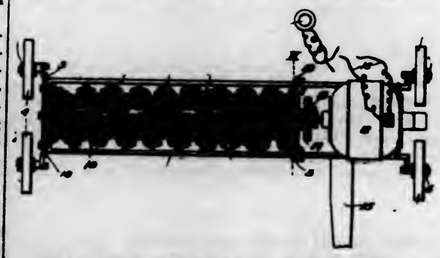
12. In manure-spreader, the combination of a main driving-shaft, a beater, a series of gears adapted to connect said main shaft with said beater, a conveyer, a second series of gears for connecting said beater to said conveyer, means for moving said connecting-gears, a spring adapted to be put under tension when said first-mentioned gears are thrown into mesh with the beater a holding device for holding same connected, and means connected with said conveyer for releasing said spring, for the purpose specified.

13. A fertilizer-distributer comprising a traction-truck, a revolving rake, suspendable connections between said truck and rake, an apron mounted for travel beneath, and operated in one direction by, said rake, yielding pressure devices for returning the apron to its initial position, a drum-shaft beneath said apron, gear connections between said rake and drum-shaft, and clutch mechanism on said drum-shaft for suspending the movement of the apron independent of the movement of the rake.

14. A fertilizer-distributer comprising a frame, journal-bearings on said frame, axle members mounted in said journal-bearings, traction-wheels supporting said axle members, a rake mounted on said frame, gear connections between said rake and axle members, clutch mechanism between said gear connections and axle members, an apron mounted for travel beneath, and adapted to be moved in one direction by, the rake, yielding pressure devices for returning the apron to its initial position, and a steering-truck carrying the forward end of said frame.

15. In a machine of the character described, traction mechanism, a counter-shaft, suspendable connections between the traction mechanism and counter-shaft, a rake, sprocket-and-chain connections between said counter-shaft and rake, an apron beneath, and adapted to be moved in one direction by, the rake, and yielding pressure devices for returning the apron to its initial position.

813,557. SURFACE-CLEANING MACHINE. ROBERT B. HUTCHISON, Pittsburg, Pa. Filed July 27, 1904. Serial No. 218,230.



Claim.—1. In a surface-cleaning machine, the combination of a framework composed of two main bars arranged parallel to each other, cross-bars providing bearings, a rotatable brush journaled in said bearings, supplemental extensions at each end provided with vertically-adjustable supporting-wheels, a motor, connecting-gearing arranged to transmit motion from the motor to the brush, and a removable casing provided with openings arranged to engage the frame and to be vertically movable relatively thereto, said casing being adapted to normally rest upon the floor and having inwardly and upwardly turned bottom portions adapted to collect the products of the brushing operation, substantially as set forth.

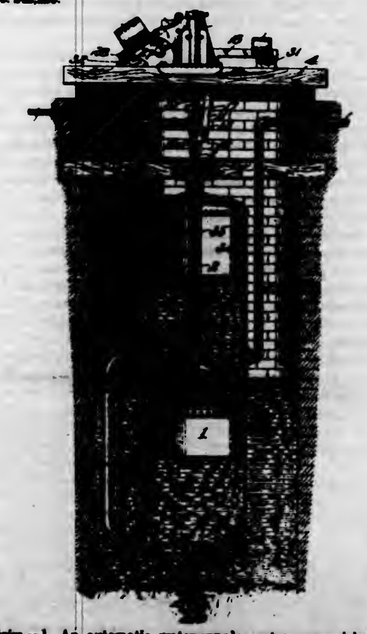
2. In a surface-cleaning machine, the combination of a framework composed of two main bars arranged parallel to each other and cross-bars providing bearings, a rotatable brush journaled in said bearings, supplemental extensions at each end provided with vertically-adjustable supporting-wheels, a motor, connecting-gearing arranged to transmit motion from the motor to the brush, and a removable casing provided with openings arranged to engage the frame and to be vertically movable relatively thereto, said casing being adapted to normally rest upon the floor and having inwardly and upwardly turned bottom portions adapted to collect the products of the brushing operation, said frame being provided with plates in position to cover the openings in the casing, substantially as set forth.

3. In a surface-cleaning machine, the combination of a portable frame having adjustable supporting-wheels, a rotatable cleaning-brush mounted in said frame, a motor mounted on the frame and in driving engagement with said brush, means for supplying power to said motor, a removable casing for the brush freely mounted upon said framework adapted to rest upon the floor independent of the frame and to permit of relatively independent vertical movement of said frame, said casing being provided with clearance-openings for the frame and having inwardly and upwardly turned bottom portions comprising oppositely-arranged pans adapted to collect the products of the brushing operation, with plates engaging the brush-shaft and frame at each end overlapping the casing to close the openings therein, substantially as set forth.

4. In a surface-cleaning machine, the combination with a rotatable brush, of a beating device flexibly connected with the shaft of the brush, and an intervening resilient stiffening device, substantially as set forth.

5. In a surface-cleaning machine, the combination with a rotatable brush, of a beating device flexibly connected with the shaft of the brush, and an intervening spiral spring arranged to normally hold the beating device outwardly beyond the shaft, substantially as set forth.

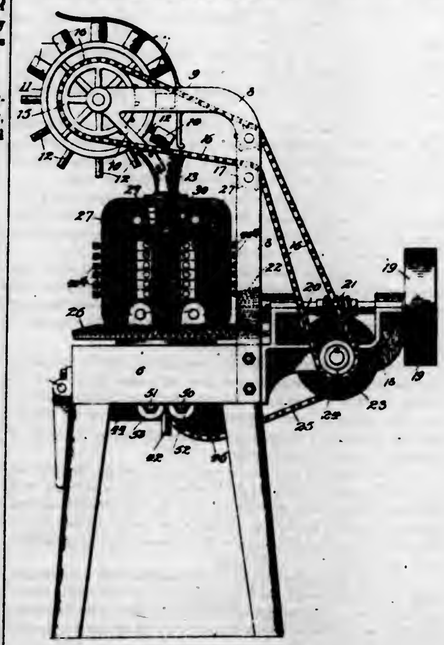
813,558. AUTOMATIC WATER-SUPPLY SYSTEM. JOHN JOHNSON, Overland Park, Mo., assignor to The Country Hydrant Company, St. Louis, Mo., a Corporation of Missouri. Filed Jan. 30, 1905. Serial No. 243,220.



Claim.—1. An automatic water-supply system comprising a submerged tank arranged to move up and down and having means for the admission and discharge of water, an auxiliary tank arranged above said tank and having a central longitudinal opening therethrough and means for the admission and discharge of water, an air-pipe extending through said opening and communicating with said submerged tank, a cock in said air-pipe arranged to be automatically operated by the up-and-down movement of said submerged tank, means to regulate the movement of said submerged tank, and means of communication between said tanks whereby water from said submerged tank may enter said auxiliary tank and compress air trapped therein.

2. An automatic water-supply system comprising a fixed tank, a vertically-movable submerged tank, a pipe connected to said movable tank and provided with a valve, means for automatically opening said valve by the movement of said movable tank, an inlet-valve in said movable tank, means having a flexible element connecting said tanks, permitting a flow of water from said movable tank to said fixed tank and preventing a flow in the opposite direction, means for the discharge of water from said fixed tank, and means to control the movement of said movable tank comprising a frame, a rod arranged to move with said movable tank and provided with separated collars, a lever pivotally mounted on said frame and provided with a pivoted dog projecting into the path of one of said projections, said lever and said dog having interlocking means whereby said dog will move with said lever in one direction and will move with respect to said lever in the opposite direction, an adjustable poise on said lever, a lever pivoted on said frame and having a part projecting into the path of the other of said collars on said rod, and means to oppose the movement of said lever in one direction.

818,559. TAPPING-MACHINE. HENRY KOEHLER, Chicago, Ill., assignor to Crane Company, Chicago, Ill., a Corporation of Illinois. Filed Mar. 2, 1903. Serial No. 145,886.



Claim.—1. A tapping machine having a stationary tapping tool, revolving means for gripping and carrying articles to be tapped along said tool, and rotary sectors adapted for alternately engaging and holding the tool and ejecting the finished article from the tool.

2. A tapping machine having a stationary tapping tool, continuous traveling mechanism for gripping and feeding the articles along the tool, and separate pairs of rotary sectors adapted for automatically holding the tool alternately at different points and for ejecting the finished article from the tool.

3. In a tapping machine in combination with a stationary tapping tool, a set of gripping and carrying blocks for engaging the articles operated upon, the same being pivoted together in a chain and being provided with means for pressing them resiliently against the article, and mounted to be driven by the motion of the article as it travels over the tapping tool, and means to revolve said carriers about the tool.

4. The combination of a resiliently mounted chain of traveling gripping and carrying blocks, positive driving means for said chain, a stationary tapping tool and means for revolving the blocks about the tool and for automatically discharging the finished article from the tapping tool.

5. In a tapping machine the combination with mechanism for revolving the articles to be operated upon, a stationary tapping tool, a pair of revoluble partially cut out rollers for alternately gripping the tool at different points of its length, and adapted to positively eject between them the finished article from the tapping tool.

6. The combination with a tapping tool having a shank of angular cross section, of two pairs of wheels grooved and partially cut away to alternately hold the tool and release and eject articles being operated upon from the tool.

7 In a tapping machine in combination with a stationary tapping tool, two pairs of revolving sectors having grooved partial circumferences adapted to hold the same alternately at different points of the shank and to positively eject articles from the tool.

8. In a tapping machine the combination with a tapping tool of two pairs of sectional revolving rollers adapted to alternately grip and release the tapping tool at different points.

9. In a tapping machine in combination with a stationary tap, a pair of revolving pivoted jaws, two sets of gripping devices mounted respectively upon said pivoted jaws, a revolving table carrying the jaws, said jaws being adapted to open to release the articles in the gripping devices.

10. The combination of a feed wheel, a vertically translating gripping device for thrusting the articles against the tapping tool, means for revolving the grippers, spring pressed rollers for insuring contact of the gripping device, a stationary tapping tool and means for holding said tapping tool in position and allowing the ejection of the articles therefrom.

11. In a tapping machine the combination with a stationary tool, of two sets of gripping blocks movable along the same and provided with resilient supporting means for holding and carrying an article over its tool, and means to revolve the holding means.

12. A tapping machine comprising the combination with a tap, of a set of revolving gripping devices movable relative thereto and provided with spring pressed means for holding the gripping devices against the articles upon the tool.

13. In a tapping machine, in combination with a stationary tap, several pairs of gripping wheels to engage said tapping tool, the same being provided with peripheries adapted to prevent the tool from turning and with open sections thereon whereby the tool is periodically released from the gripping wheels.

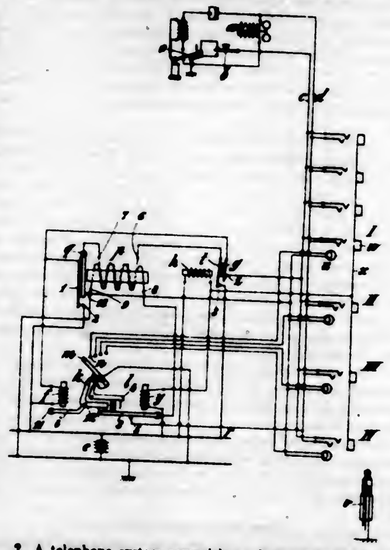
14. In a tapping machine the combination with a stationary tap having a shank of angular section, of several pairs of wheels placed together with angular openings between their peripheries, and being provided with cooperating open sections on the wheels, whereby the tool may be released and space allowed for discharge of the article from the tapping tool.

15. In a tapping machine the combination with a tapping tool and a stationarily mounted pair of gripping rollers therefor, said gripping rollers being partially cut out on their peripheries and mounted in shiftable bearings to engage the tool, and means for retracting the bearings together for the purpose of releasing the tool and removing it.

16. In a tapping machine the combination with a continuous chain of gripping devices, of a series of blocks provided with rollers and compression springs adapted to hold the rollers against the gripping devices and force them in contact with the articles being operated upon by the machine.

813,560. TELEPHONE SYSTEM FOR CENTRAL STATIONS. GUSTAV LAMBERT, Charlottenburg, Germany. Filed Apr. 16, 1902. Serial No. 103,128.

Claim.—1. A telephone system comprising two or more groups at the central station which the subscriber may call up directly and whenever desired, a loop-conductor connected to the telephone central station, one branch of the double conductor-line of the subscriber including an electromagnet *f* at the station, a circuit-closing piece *m* actuated by said electromagnet, so as to assume the calling or signaling position, another electromagnet *p* upon the other branch adapted to be put in connection with the said circuit-closing piece *m*, and a signal-lamp *u* the circuit of which is maintained closed by means of the connections between said electromagnet *p* and said circuit-closing piece until the call is answered from the station, the said signal-lamp being arranged in the answering group.



2. A telephone system comprising a loop-conductor line connected to the central station, an electromagnet *p* in one branch of said loop and an electromagnet *f* on the other branch, a selective means actuated by said electromagnet *f* and means to short-circuit the electromagnet *f* by the actuation of the electromagnet *p* until the call is answered.

3. In a telephone system, comprising a loop-conductor line connected to the central station, substantially as described, and an electromagnet *f* on one branch and an electromagnet *p*, a signal-lamp on the other branch in connection with said electromagnet *p*, an inquiry-plug *v* and two electromagnets *h* and *y* excited by inserting the said plug, the armature of the electromagnet *h* cutting out the subscriber-circuit of the electromagnets *f* and *p* from the signal-lamp, while the armature of the electromagnet *y* causes the circuit-closing piece *m* to return to its initial position and disconnecting the electromagnet *p* from the subscriber-circuit.

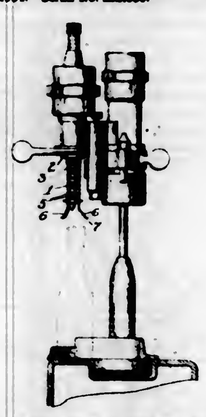
4. Telephone system including magnets *p*, *f* and circuit connections, substantially as described, in which the number of convolutions and the resistances of the electromagnets *f* and *p* are so calculated that the circuit generated in the subscriber-table after taking the telephone off its hook, actuates the electromagnet *p* only, but not the electromagnet *f*, and selective means operated by said electromagnets.

813,561. LEVEL. RUDOLPH LEGGHART, San Antonio, Col. Filed Oct. 4, 1905. Serial No. 281,394.

Claim.—As a new article, a plate having a transverse aperture and with a tubular member disposed transversely of said aperture

and open at one end and with a longitudinal aperture in one side opposite the aperture in the plate, said tubular member adapted to support a spirit-tube with its central portion exposed through said apertures and means for attaching said plate to a straight-edge.

813,562. BOTTLING-MACHINE. ERNEST U. MACK, Florence, S. C., assignor to The Crown Cork and Seal Company, Baltimore, Md. Filed Nov. 11, 1904. Serial No. 232,869.



Claim.—1. In combination in a bottling-machine, a nozzle adapted to enter the bottle-mouth and resilient means for centering the bottle in relation to the nozzle, said means extending down along the nozzle and acting as the nozzle and bottle are brought together, substantially as described.

2. In combination, in a bottling-machine, a nozzle and a spring finger or fingers supported at their upper ends with their lower ends free, said fingers being associated with the nozzle for engaging the bottle and centering the same in relation to the nozzle as the nozzle and bottle are brought together, substantially as described.

3. In combination in a bottling-machine, a nozzle, a spring finger or fingers depending from an upper point or support along the nozzle and having outwardly and downwardly inclined lower free ends for engaging the bottle and centering the same in relation to the nozzle.

4. In combination in a bottling-machine, a nozzle adapted to enter the bottle, and a sliding collar on the said nozzle with a spring for pressing the said nozzle downwardly to prevent the lifting of the bottle as the nozzle is withdrawn therefrom and a plurality of spring-fingers between which the collar slides, substantially as described.

5. In combination in a bottling-machine, a nozzle, a centering finger or fingers depending below the same to contact with the bottle, a collar adapted to slide on the nozzle, a spring for pressing the collar downwardly and a stop associated with the collar and centering-finger, substantially as described.

6. In combination, the nozzle, the sliding spring-pressed collar, the centering-fingers and the sliding connection between the said fingers and the collar, substantially as described.

7. In combination, the nozzle, the centering-fingers slotted vertically, a spring-pressed collar having pins projecting from the collar through the slots in the fingers, substantially as described.

8. In combination with the nozzle, a spring-pressed collar thereon and means for limiting the downward movement of the collar consisting of the finger or arm between which and the nozzle the lip of the bottle is adapted to move, the said collar having a connection with the said arm or finger, substantially as described.

9. In combination in a bottling-machine, a nozzle adapted to enter the bottle-mouth, and means for centering the bottle in relation to the nozzle, said means being yielding laterally in relation to the nozzle, substantially as described.

10. In combination in a bottling-machine, a nozzle adapted to enter the bottle-mouth, and means for centering the bottle in relation to the nozzle, said means comprising a plurality of members individually yieldable radially in respect to the nozzle, substantially as described.

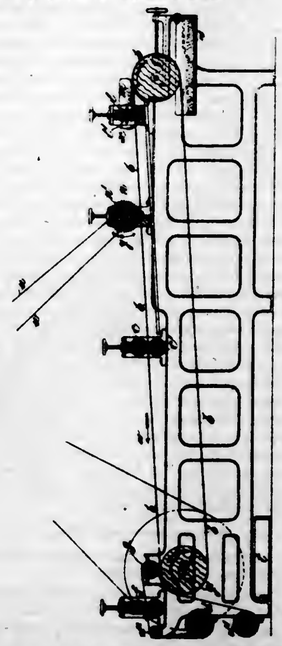
11. In combination in a bottling-machine, a nozzle adapted to enter the bottle-mouth, and a plurality of fingers depending along the nozzle and individually yieldable radially in respect to the nozzle, substantially as described.

813,563. CHURN. JOSEPH F. MARGAN, St. Paul, Minn. Filed Feb. 6, 1905. Serial No. 244,268.

Claim.—1. The combination of an earthen jar having about its top an exterior rim, a cover on the jar, the bracket 19 secured upon the cover, a curved clamp having a vertically-playing pivot-joint in the bracket and its lower end engaging the under side of the rim, and in its upper end a thumb-screw pressing upon the cover so as to force the lower end of the clamp in and upward under the rim and lock it in that position.

2. The combination of an earthen jar having about its top an exterior rim, a cover on the jar, the bracket 19 secured upon the cover, a curved clamp having a vertically-playing pivot-joint in the bracket and its lower end engaging the under side of the rim, and in its upper end a thumb-screw pressing upon the cover so as to force the lower end of the clamp in and upward under the rim and lock it in that position, and a hand-operated churning mechanism carried by said cover and operating within the jar.

813,564. MACHINE FOR COATING FABRICS WITH FINELY-COMMINUTED MATERIALS. HARRIS MARKUS, Manchester, England. Filed Oct. 5, 1905. Serial No. 281,456.



Claim.—A machine for coating fabrics with flock or the like materials having in combination a traveling temporary support *b*, a fluted roller *l*, a brush *n*, pressing-rollers *c*, *c'*, and means for spreading the adhesive material on the final support and transferring the flock from the temporary support, the whole constructed and operating substantially as hereinbefore described and shown.

813,565. WHEEL. CHARLES F. MARDEN, Milwaukee, Wis. Filed Sept. 30, 1905. Serial No. 280,231.

Claim.—1. In a wheel, the combination of a wheel-body, a box adapted to receive an axle, a pneumatic tube surrounding the box and resting against the wheel-body, an annulus, of resilient or springy material interposed between the box and the pneumatic tube, and rings of cushioning material disposed at opposite sides of the annulus and surrounding and extending radially from the box; the wheel-body and the said rings of cushioning-material being so relatively arranged that the latter do not bear on the former except when undue weight is imposed on the box.

2. A wheel comprising a body containing a case having side walls provided with central, circular openings, a box arranged in the case and having rings of resilient material extending beyond its outer side and arranged in the same planes as the side walls of the case and loosely occupying the openings in said side walls, an inflatable tube surrounding the box and arranged in and against the case, and an annulus of resilient or springy material surrounding the box and interposed between the same and the inflatable tube.

3. A wheel comprising a body containing a case having side walls in which are central, circular openings and also having a circular wall and apertures therein, a box arranged in the case and having rings of resilient material extending beyond its outer side and arranged in the same planes as the side walls of the case and loosely occupying the openings in said side walls, an inflatable tube surrounding the box and arranged in and against the case and having teats disposed in the apertures in the circular wall thereof, in combination with an axle occupying the box and having threaded portions, threaded disks mounted on the threaded portions of the axle and disposed at opposite sides of the case of the wheel, and antifriction-balls interposed between said disks and the ends of the box.

4. A wheel comprising a body containing a case, a box arranged in the case, an inflatable tube surrounding the box and arranged in and against the case, and an annulus of resilient or springy material surrounding the box and interposed between the same and the inflatable tube; in combination with an axle occupying the box, and disks fixed on the axle at opposite sides of the case of the wheel.

5. A wheel comprising a body containing a case having side walls provided with central, circular openings, a box arranged in the case and having rings of resilient material extending beyond its outer side and arranged in the same planes as the side walls of the case and loosely occupying the openings in said side walls, an inflatable tube surrounding the box and arranged in and against the case, and an annulus of resilient or springy material surrounding and held to the box and interposed between the same and the inflatable tube; in combination with an axle occupying the box, and disks fixed on the axle at opposite sides of the case of the wheel.

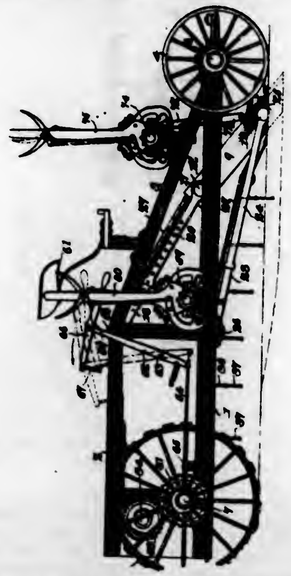
813,566. EXCAVATOR. WILLIAM R. MARTIN, Idaho Falls, Idaho. Filed July 20, 1905. Serial No. 271,700.

Claim.—1. In a machine of the class described, the combination with a receptacle, of a conveyer working thereacross and formed in successive sections, and means to successively dump the sections when passing across the receptacle.

2. In a machine of the class described, the combination with a receptacle, of a conveyer made up of a succession of independent sections, and a trip device located in the path of the sections when passing across the receptacle to successively dump the sections.

3. In a machine of the class described, the combination with a receptacle, of a conveyer made up of successive independent sections, each section having a hinge-joint intermediate of its ends and extending transversely thereof, and a trip disposed to successively break the joints of the conveyer-sections to dump the same when passing across the receptacle.

4. In a machine of the class described, the combination of a receptacle, a conveyer working thereacross and comprising spaced belts and a series of independent conveyer-sections carried thereby, each section having a hinge-joint intermediate of its ends and transversely thereof with the hinge-pintle projecting at opposite edges of the section, and a pair of rotatable trip members provided with cams located in the paths of the projected ends of the hinge-pintle and capable of being turned thereby to lift the pintle and break the joint of the conveyer-section to dump the contents thereof.



5. In a machine of the class described, the combination of a receptacle, a conveyer working across the receptacle and comprising spaced belts and a series of independent conveyer-sections pivoted therebetween, each conveyer-section having guide projections at opposite sides thereof, rails to support the conveyer-sections when passing across the receptacle, and trip members located in the paths of the projections to tilt the sections and dump the contents thereof.

6. In a machine of the class described, the combination of a receptacle, a conveyer working across the receptacle, means to cause the conveyer to dump into the receptacle, and means controlled by the accumulation of material in the receptacle to shift the position of the conveyer-dumping means to render the latter active at different successive positions.

7. In a machine of the class described, the combination of a receptacle, a conveyer working across the receptacle, a trip device for dumping the conveyer at the receptacle, and means to shift the position of the trip by the accumulation of material in the receptacle consisting of a spring-pressed element pivotally connected to the trip, and a rack and dog for said element to yieldably hold the same against the pressure of material in the receptacle, said element capable of yielding under the pressure of the collected material to disengage the dog from the rack and shift the element and the trip until the pressure is relieved and the dog reengages the rack.

8. In a machine of the class described, the combination of a receptacle, a conveyer working across the receptacle and including individual sections capable of being dumped, spaced rails extending across the receptacle, each rail being provided with a longitudinal series of openings to constitute a rack, a cross-head movably supported upon the racks, a trip carried by the cross-head and in the paths of the conveyer-sections to individually dump the same, and means to automatically shift the cross-head upon the track consisting of a plate pivotally hung from the cross-head, a spring to yieldably support the plate in a downwardly and forwardly inclined position within the receptacle, and dogs rising from the plate into cooperative relation with the respective racks, the plate capable of yielding under the pressure of the collected material within the receptacle to disengage the dogs from the racks and permit rearward movement of the cross-head with the plate under the pressure of the material, the spring serving to return the dogs into engagement with the racks when the pressure of the material is decreased.

9. In a machine of the class described, the combination of a receptacle, a conveyer leading thereto, independent vertically-tiltable bottom sections for the receptacles, controlling-cables connected to the bottom sections, guides for the cables, and a controlling-windlass around which the cables are wound.

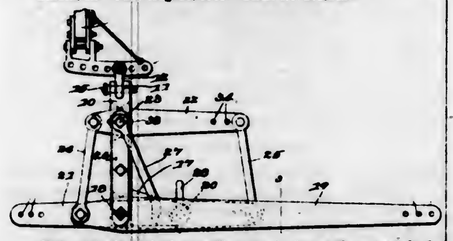
10. In a machine of the class described, the combination with a receptacle, of an endless conveyer working across the top and bottom of the receptacle and made up of a succession of sections pivotally connected to the belts of the conveyer, means to dump the conveyer-sections when passing across the top of the receptacle, and one or more tiltable bottom sections for the receptacle to permit dumping thereof, the sections of the conveyer being unsupported and permitted to hang downwardly when passing across the bottom of the receptacle to permit downward tilting of the bottom sections of the receptacle between adjacent conveyer-sections.

11. In a machine of the class described, the combination with a wheel-supported frame, of an endless conveyer driven from one of the wheels, a clutch included in the drive connection for the conveyer, and controlling means connected to the clutch and capable of being engaged with the conveyer to automatically release the clutch and stop the conveyer.

12. In a machine of the class described, the combination with a wheel-supported frame, of an endless conveyer driven from one of the wheels, a clutch included in the drive connection for the conveyer, a lever, a connecting-rod between the lever and the clutch, and a dog pivotally carried by the lever and capable of being engaged with the conveyer to automatically move the lever and release the clutch.

13. In a machine of the class described, the combination with a wheeled frame, of a scraper, pairs of overlapped adjustably-connected bars pivotally connected to the upper portion of the scraper and to an upper portion of the frame, other pairs of overlapped adjustably-connected bars connected to the lower portion of the scraper and the lower portion of the frame, each pair of bars being inclined upwardly and rearwardly from the scraper, and means connected to the scraper for raising and lowering the same.

813,567. FOUR-HORSE EQUALIZER. CHARLES H. MATLOCK, Linden, Ill. Filed Aug. 21, 1905. Serial No. 275,143.



Claim.—1. In a draft-equalizer, a clevis member, two draft-beams of unequal length each pivoted near one of its ends to said clevis member, the longer arms of the beams extending, respectively, in opposite directions, an equalizer-beam pivoted near one of its ends to said clevis, a coupling member between the shorter arm of the equalizer-beam, and the shorter arm of the longer draft-beam, and a coupling member between the longer arm of the equalizer-beam and the shorter arm of the short draft-beam.

2. In a draft-equalizer, a clevis member having a laterally-extending bracket, a relatively long draft-beam pivoted near one end to said clevis, a relatively short draft-beam pivoted near one end to said bracket with the longer ends of said draft-beams extending in opposite directions, an equalizer-beam pivoted to said clevis, a coupling element between the shorter end of said equalizer-beam and the shorter end of said longer draft-beam, and a coupling element between the longer end of said equalizer-beam and the shorter end of said shorter draft-beam.

813,568. INCANDESCENT-LAMP SOCKET. ROBERT B. MILLER, Grand Rapids, Mich. Filed Jan. 3, 1905. Serial No. 239,209.

Claim.—1. In an incandescent-lamp socket, a triangular switch-lever fulcrumed at or near the center of the triangle and having upon the inner arm thereof an extension-lever, pivoted thereto and fulcrumed thereon by projections upon the switch-lever on either side thereof and spaced a little wider than the width of the extension-lever, adapted to engage a spring contact-piece to close the circuit and to quickly release the same in breaking the circuit, all substantially as described.

2. In an incandescent-lamp socket, the combination of an insulating-block L, the center contact-stud D, the contact-spring B secured to the stud by the screw C set at an angle to prevent the turning of the stud D, the nut F connected with one of the circuit-wires and adapted to complete a circuit by contact with the spring B, and the triangular switch-lever pivoted on the fulcrum E at or near the center of the triangle and adapted to engage the spring B to open or close the circuit by pressing upon the alternately-elevated outer arms of said lever, all substantially as set forth.

3. In an incandescent-lamp socket, the combination of an insulating-block M, an insulating-block N adapted to telescope thereon, the bolt O and nut P, the outer contact-screw G and nut E, the center contact-stud D, the contact-spring B secured to the stud D by the screw C set at an angle to prevent the turning of the stud, the nut F connected with a circuit-wire and adapted to complete a circuit by contact with the spring B, and the triangular switch-lever pivoted on the fulcrum E near the center of the triangle and adapted to engage the spring B to open or close the circuit by pressing upon the alternately-elevated outer arms of said lever, all substantially as set forth.

813,569. PUSH-RAKE. WILSON W. MILLER, Newton, Kans. Filed Apr. 29, 1905. Serial No. 258,086.

Claim.—1. In a rake of the class described, the combination with a fork, of an ejector operating thereover, a winding-drum, a cable connection between the drum and ejector, and means for operating the drum.

2. In a rake of the class described, the combination with a fork, of a ground-wheel for the fork, an ejector operating over the fork, a winding-drum, a cable connection between the drum and ejector, and means for connecting the ground-wheel and drum for operating the latter from the former, said means including a clutch.

3. In a rake of the class described, the combination with a fork, of an axle-shaft journaled thereon, ground-wheels carried by the shaft, an ejector operating over the fork, a winding-drum loosely journaled on the axle-shaft, a cable connection between the drum and ejector, a clutch mounted on the axle-shaft for connecting the same to the drum, and means for operating the clutch.

4. In a rake of the class described the combination with a fork of a tongue extending centrally and rearwardly thereof, a ground-wheel support for the fork, an ejector operating over the fork, an ac-

tuating-bar centrally connected to the ejector and movably connected to the tongue, and means operated by the ground-wheel support for moving the actuating-bar and thereby the ejector.

5. In a rake of the class described, the combination with a fork, of a tongue extending centrally and rearwardly thereof, a ground-wheel support for the fork, an ejector operating over the fork, an actuating-bar movable along the tongue, a pivotal connection between the bar and the central portion of the ejector, braces pivotally connecting the end portions of the ejector and the bar, and means for moving the bar to actuate the ejector.

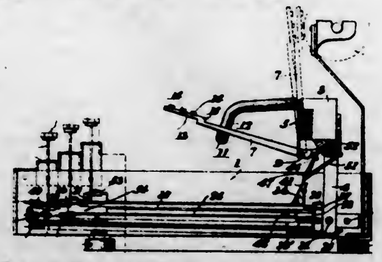
6. In a rake of the class described, the combination with a forwardly-extending fork, of an axle-shaft, ground-wheels for supporting the fork, a rearwardly-extending tongue for the fork, an ejector-frame slidably mounted on the fork and movable thereover, an actuating-bar slidably mounted upon the tongue, a pivotal connection between the bar and the central portion of the ejector-frame, oppositely-extending brace-links pivotally connecting the bar and the end portions of the frame, a drum journaled upon the axle-shaft, a cable connection between the drum and bar, and a clutch for connecting the drum and axle-shaft.

7. In a rake of the class described, the combination with a forwardly-extending fork, of a movable ground-support for the fork, an ejector for the fork movable thereover, actuating means for moving the ejector, and a spring connection between said means and ejector.

8. In a rake of the class described, the combination with a fork, of an ejector movable thereover, actuating means for moving the ejector including a bar pivoted to said ejector, and a spring connection between the bar and the ejector.

9. In a rake of the class described, the combination with a forwardly-extending fork, of a wheeled support therefor including an axle-shaft, a rearwardly-extending tongue, an ejector-frame having a roller bearing upon the fork and movable transversely thereover, an actuating-bar pivotally connected to the frame and slidable upon the tongue, braces connecting the bar and frame and permitting the pivotal movement thereof, a spring connection between the bar and upper portion of the frame, a drum loosely journaled on the axle-shaft, a cable connection between the drum and the rear portion of the actuating-bar, a clutch for connecting the drum and axle-shaft, and means mounted on the tongue for actuating the clutch.

813,570. **TYPE-WRITING MACHINE.** JOHN H. MOLLE, Sturgeon Bay, Wis. Filed Dec. 28, 1904. Serial No. 238,575.



Claim.—1. The combination with a type-bar and a key, of a connecting-rod terminating at opposite ends in cranks which are respectively connected to the key and the type-bar, and a support engaging the crank-arms intermediate of their ends with the arms rotatable thereon, the connecting-bar being free to rotate upon the support for actuating the type-bar by a depression of the key and said connecting-bar also capable of being torsionally twisted when the type-bar strikes the platen to permit further depression of the key and thus cushion the action.

2. The combination with a type-bar and a key, of a torsionally-twistable rock-bar terminating at opposite ends in cranks which are respectively connected to the type-bar and the key, and a supporting-rod loosely piercing the crank-arms.

3. The combination with a type-bar and a key, of an elastic torsionally-twistable rock-bar terminating at opposite ends in cranks which are respectively connected with the type-bar and the key, a supporting-rod loosely piercing the cranks, and means carried by the rod to prevent creeping of the rock-bar under its torsional elastic action.

4. The combination with a type-bar and a key, of a torsionally-twistable elastic rock-bar terminating at opposite ends in cranks which are respectively connected with the type-bar and the key, a supporting-rod loosely piercing the cranks, and elastic sleeves frictionally embracing the rod and in engagement with the opposite ends of the bar to prevent creeping of the latter under its torsional action.

5. The combination with a type-bar and a key, of a rock-bar provided with opposite cranks which are respectively connected to the type-bar and the key, and a supporting-rod loosely piercing the cranks.

6. In a key-action for type-writing machines, the combination of a rock-bar having a crank provided with a perforation, a guard member adjacent the crank, and a key having a stem provided with a lateral pin detachably engaging the perforation in the crank and working between the latter and the guard member to prevent displacement of the stem.

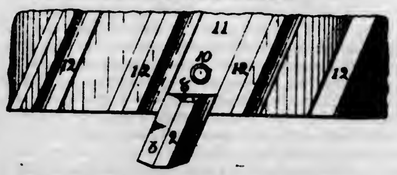
7. A type-writing machine having a main frame, projections extending inwardly from the frame at one end thereof, a key-action frame removably supported at one end upon the projections, set-screws carried by the key-action frame adjacent the projections for frictional engagement with the main frame, and other set-screws piercing the other end of the main frame for detachable engagement with the key-action frame.

8. In a type-writing machine, the combination with a frame, of a type-bar support, type-bars mounted upon the support, a key-action frame having its opposite ends provided with corresponding perforations, rods having their ends supported in the perforations of the key-action frame, rock-bars mounted upon the rods and connected to the corresponding type-bars, and keys connected to the rock-bars for rocking the same upon their supporting-rods.

9. In a type-writing machine, the combination of a frame, a type-bar support carried by the frame above the rear end thereof, type-bars mounted upon the support, rods extending between the front and back of the frame, rock-bars mounted upon the rods and terminating at opposite ends in cranks, connections between the rear cranks and the type-bars, guard-bars carried by the front of the frame and extending thereacross adjacent the front cranks, and keys having stems connected with the respective front cranks and working between the latter and the adjacent guard-bars.

10. In a type-writing machine, the combination with a frame, a type-bar support, a type-bar mounted thereon, a rod having its ends supported in openings in opposite ends of the frame, a torsionally-twistable elastic rock-bar having terminal cranks pierced by the rod, an operative connection between one of the cranks and the type-bar, a key connected to the other crank, an elastic sleeve frictionally embracing the rod and bearing against one end of the rock-bar and the adjacent end of the frame, another elastic sleeve frictionally embracing the rod and bearing against the opposite end of the rock-bar, and a third elastic sleeve embracing the rod and bearing against the other end of the frame, said sleeves operating to prevent creeping of the rock-bar upon the rod and prevent accidental endwise displacement of the rod through the openings in the frame.

813,571. **TOE OR GROUTER ATTACHMENT FOR TRACTION-WHEELS.** JOHN MCDONALD, Blair township, Washington county, Nebr. Filed Oct. 7, 1905. Serial No. 281,880.



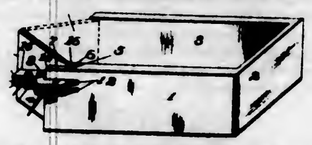
Claim.—1. A toe or grouter attachment for traction-wheels consisting of a part to project laterally to engage the road at one side of the path of the wheel and having a bifurcate base to engage the adjacent edge of the rim of the wheel and adapted to be rigidly fastened thereto.

2. A toe or grouter for the wheels of traction-engines, having a bifurcated base to engage the edge of the rim of the wheel; and the inner branch of the forked base bifurcated to engage a spoke of the wheel.

3. A detachable toe or grouter to set to one side of the tread of a traction-wheel, and having a bifurcate base to engage the edge of the rim of said traction-wheel, and one branch of said base furcation again bifurcated to engage a spoke or bolt through the said rim.

4. A detachable toe or grouter, for the drive-wheels of traction-engines, having a bifurcation to engage the rim of the wheel, the inner branch of this bifurcation bifurcated to engage a spoke of the wheel, and a bolt disposed through the inner branches against the spoke.

813,572. **MOLDING APPARATUS.** WILLIS H. MCDOWELL, Auburn, Ind. Filed May 19, 1905. Serial No. 260,113.



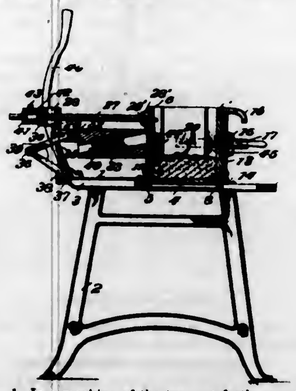
Claim.—1. A mold having one side formed with a recess, the edge of the adjacent end being beveled to loosely seat in the said recess, and means to adjust said latter end.

2. A mold having one side reduced at the end to provide a transversely-arranged shoulder, the adjacent end having one edge beveled to bear against said shoulder and means to adjust said end.

3. A mold having one side formed with a recess and provided with clamping-arms, the adjacent end of the mold being beveled to seat in said recess, and an arm projecting from said end and normally held between the clamping-arms.

4. A mold having one side formed with a recess and provided with clamping-arms, the adjacent end of the mold being beveled to seat in said recess, an arm projecting from said end and normally held between the clamping-arms, and means for adjusting said clamping-arms.

813,573. **MACHINE FOR MANUFACTURING CONCRETE BUILDING-BLOCKS.** WILLIS H. MCDOWELL, Auburn, Ind. Filed Aug. 10, 1905. Serial No. 273,660.



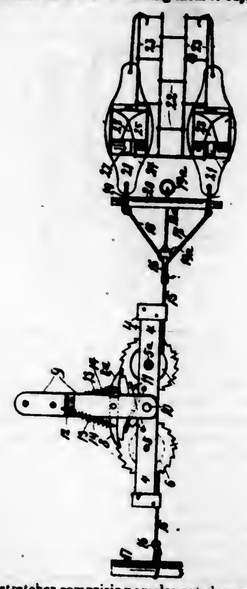
Claim.—1. In a machine of the type set forth, a mold having openings in one side thereof, rods supported solely from one of the mold sides, a cross-head comprising a bar penetrated by said rods, extensions carried by the bar and spaced from the same, and also penetrated by said rods, webs connecting the said extensions to the bar, downwardly-extending projections carried by the bar, cores having bosses, means for securing said bosses to said projections, and means for operating the cross-head.

2. In a machine of the type set forth, a core having an inclined opening extending from end to end of the same, a guide-lip carried at the front of the core and below the opening thereof, and a mold having an opening to receive said lip.

3. In combination with a mold, a core formed with an opening, an element of shovel-like form carried by the core to deposit the displaced plastic material in said opening, and means to operate the core.

813,574. **WIRE-STRETCHER.** WILLIAM MCNAMES, Aberdeen, S. D. Filed May 5, 1905. Serial No. 259,973.

Claim.—1. A wire-stretcher comprising an elongated open frame, an operating-lever pivoted at the middle thereof, two spring-pressed dogs carried by the lever, two rope-drums mounted in the frame, one near each side of the lever, ratchet-wheels on the drums operated by the dogs, stopping-pawls pivoted to the frame and engaging the ratchet-wheels, two ropes, one wound on each drum and having at their free ends means for attaching them to objects.



2. A wire-stretcher comprising an elongated open frame, an operating-lever pivoted at the middle thereof, two spring-pressed dogs carried by the lever, two rope-drums mounted in the frame, one near each side of the lever, ratchet-wheels on the drums operated by the dogs, stopping-pawls pivoted to the frame and engaging the ratchet-wheels, two ropes, one wound on each drum, and snap-hooks secured to the free ends of one or both of the ropes.

3. A wire-stretcher comprising an elongated open frame, an operating-lever pivoted at the middle thereof, two spring-pressed dogs carried by the lever, two rope-drums mounted in the frame, one near each side of the lever, ratchet-wheels on the drums operated by the dogs, stopping-pawls pivoted to the frame and engaging the ratchet-wheels, two ropes, one wound on each drum, a plurality of arms, 18 18ª, extending from the outer end of one of the ropes, wire-clamping devices carried by each of said arms, and means for holding the arms spread.

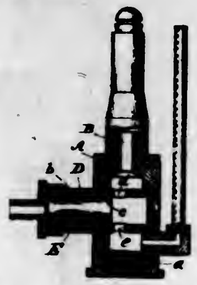
4. A wire-stretcher comprising an elongated open frame, an operating-lever pivoted at the middle thereof, two spring-pressed dogs carried by the lever, two rope-drums mounted in the frame, one near each side of the lever, ratchet-wheels on the drums operated by the dogs, stopping-pawls pivoted to the frame and engaging the ratchet-wheels, two ropes, one wound on each drum, a plurality of arms, 18 18ª, extending from the outer end of one of the ropes, wire-clamping devices carried by each of said arms, and means for holding the arms spread, and snap-hooks at the ends of the two ropes, substantially as and for the purposes set forth.

813,575. **EYELET.** ARTHUR C. NICHOLS, Waterbury, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a Corporation of Connecticut. Filed Mar. 24, 1903. Serial No. 149,200.

Claim.—1. An eyelet, having a flange flat on both sides, an integral barrel or tube, a shoulder formed in the barrel below the flange, and a coating applied to the face and rim of the flange and terminating within the shoulder, and exposing a circle of the bright metal of the barrel or tube.

2. An eyelet, having a flange flat on both sides, a barrel or tube integral with the flange, a shoulder formed in the barrel below the flat flange, and a coating of enamel applied flat to the surface of the flange and around its rim and terminating within the shoulder and exposing a circle of the bright metal of the barrel or tube.

813,576. APPARATUS FOR LIGHTING AND EXTINGUISHING GAS. RICHARD H. OAKMAN, New York, N. Y. Filed May 27, 1905. Serial No. 262,667.

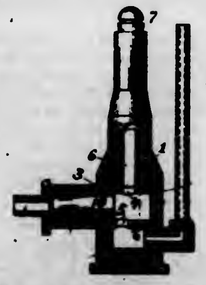


Claim.—1. In a gas lighting and extinguishing apparatus, a cylinder having a throughway for the passage of gas to a burner, and provided with a reciprocating piston, arranged to close the throughway when the body of the piston covers it, and to open the throughway, when moved in the reverse direction until the end of the piston has passed over and beyond the throughway, in combination with a burner at the end of the throughway and a duct upon the piston communicating from the rear of the cylinder to the throughway to the burner.

2. In a gas lighting and extinguishing apparatus a cylinder provided with a throughway for the passage of gas to the burner and having a reciprocating piston, to open and close the throughway of the cylinder, in combination with a burner at the end of the throughway, a duct upon the piston, communicating with the throughway to the burner, and means for preventing the piston from turning within the cylinder.

3. In a gas lighting and extinguishing apparatus a cylinder provided with a throughway for the passage of gas to the burner and having a reciprocating piston, and a burner at the upper end of the throughway in combination with a duct upon the piston, extending to its end and communicating from the rear end of the cylinder to the throughway leading to the burner, a small burner having its flame located in the path of the main burner, and a small passage-way to this burner leading from a point in the gas-conduit below the cylinder.

813,577. APPARATUS FOR CONTROLLING GAS-CONDUITS. RICHARD H. OAKMAN, New York, N. Y. Filed June 19, 1905. Serial No. 265,894.

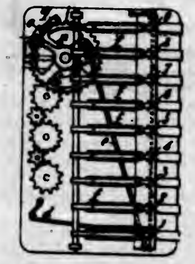


Claim.—1. In an apparatus for controlling gas-conduits, a cylinder having openings or ports, communicating with a gas-conduit, and provided with a solid reciprocating piston, to close the ports when its body covers them, and to open the ports when its end has passed beyond them, in combination with a duct leading from the rear end of the cylinder to the gas-conduit.

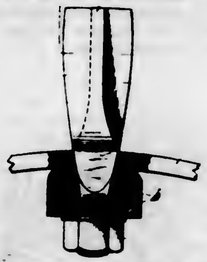
2. In an apparatus for controlling gas-conduits, a cylinder having openings or ports communicating with a gas-conduit, in combination with a solid reciprocating piston to open and close the ports, said cylinder provided with a slot in its upper wall, extending from its upper gas-port to the rear end of the cylinder.

813,578. ADDING-MACHINE. JOSEPH PALLWEBER, Mannheim, Germany. Filed May 13, 1904. Serial No. 207,894.

Claim.—An adding-machine comprising a set of toothed intermeshing wheels and operating means therefor comprising a lever oscillatably mounted on the shaft of one of the toothed wheels, a pawl loosely connected at one end with the lever and adapted to engage at the other end with the teeth of said gear-wheel, a slide having teeth each provided with an inclined edge, keys arranged to bear upon the inclined edges of the teeth and shift the slide when said keys are depressed, a link connected at one end with an arm of the oscillatable lever and at the other end with the slide, and a plate *q* bent as described and with which the pawl is adapted to engage in the manner and for the purpose specified.

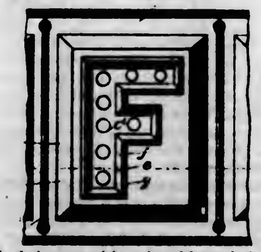


813,579. CYLINDER-TOOTH. LARS P. PEDERSEN, Westbrook, Minn. Filed July 10, 1905. Serial No. 268,944.



Claim.—A reversible cylinder-tooth formed with laterally-offset blade portions 1^a united by a web portion 1^b providing the blade portions of said tooth with a plurality of laterally-offset striking edges or surfaces and making the same reversible, substantially as described.

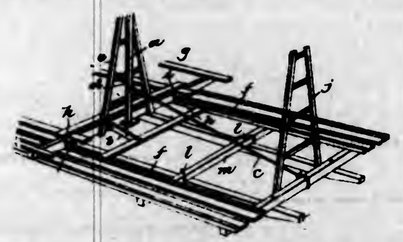
813,580. SIGN. CHARLES A. PETERSON, Salt Lake City, Utah. Filed May 29, 1905. Serial No. 262,913.



Claim.—1. A sign comprising a board for each character on the sign, a letter-base having beveled edges on each of said boards, hollow letters set up on edge on said bases; lights in said letters projecting through apertures in said bases, upwardly and outwardly inclined flanges *f* on the outer edges of said letters and outwardly and downwardly inclined flanges *g* on the outer edges of said flanges *f*, as described.

2. A sign comprising letter-bases, hollow letters set up on edge on said bases, lights in said letters projecting through apertures in said bases, upwardly and outwardly inclined flanges *f* on the outer edges of said letters and outwardly and downwardly inclined flanges on the outer edges of said flanges *f*, as herein set forth.

813,581. HAY-LOADER. SAMUEL V. PLESS, Polk, Ohio. Filed Apr. 17, 1905. Serial No. 256,041.



Claim.—1. An attachment for hay-loader, comprising a track independent of but adapted to be mounted upon the loader, a car removably mounted on said track so as to run back and forth thereon, a crank-shaft on the car, and a rope or cable connecting said crank-shaft with one end of the loader to adapt the car when loaded to be drawn toward said end, substantially as described.

2. An attachment for hay racks or loader, comprising a track having rails extending longitudinally of the rack and removably mounted thereon, a platform or car on wheels adapted to run along said track, an upright at one end of said car, a vertical shaft adjacent to said upright having a flexible connection with a fixed part of the rack, for drawing the car along said track, a latch carried by the car adapted to engage a fixed point and hold the car stationary, and a flexible connection between said latch and a point near the upper end of the vertical shaft, for operating said latch to release the car.

3. An attachment for hay racks or loader comprising a track having rails extending longitudinally of and removably mounted on the rack, a wheeled platform or car removably mounted on said track-rails, means carried by the car for moving it along the track and for holding it against forward movement, and means for releasing said holding means to permit the car to move forward.

4. An attachment for hay racks or loader comprising a track adapted to be mounted upon the rack and removable therefrom, a platform or car mounted on said track and adapted to run back and forth thereon, means carried by the car for engaging the track to prevent movement of the car, a vertical shaft and upright or support therefor at one end of the car, and a rope or cable connecting said shaft with a fixed part of the rack for drawing the car along said track.

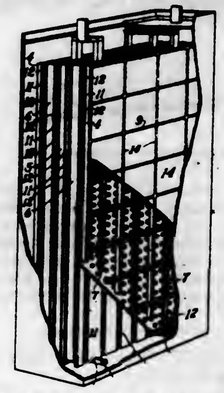
5. An attachment for hay racks or loader comprising a track adapted to be mounted upon the rack and removable therefrom, a platform or car mounted on said track and adapted to run back and forth thereon, a vertical crank-shaft and an upright or support therefor at one end of the car, and a rope or cable connecting said shaft with a fixed part of the rack, for drawing the car along said track.

6. In combination with the hay-loader, a track mounted thereon and removable therefrom, a car removably mounted on and movable along said track, a vertical crank-shaft on said car, a rope or cable connecting said shaft with one end of the loader, a latch on the car adapted to engage a fixture on said track for holding the car stationary, and means adjacent to said crank-shaft for releasing said latch to permit the car to be moved forward by turning the crank, substantially as described.

7. In combination with a hay loader or frame, a track removably mounted thereon, a car mounted on and movable along said track, a vertical shaft on said car, a rope or chain extending around said shaft and secured at one end to one end of the loader or frame, and a latch and manipulating-cord extending therefrom to a point near the upper end of said shaft for holding the car stationary and releasing it at will to permit it to move forward when the shaft is turned, substantially as described.

813,582. ELECTRIC STORAGE BATTERY. HARRIS H. PORTER, Providence, R. I., assignor to Rhode Island Electrosmelting Company, Providence, R. I., a Corporation of Maine. Filed Sept. 21, 1903. Serial No. 173,327.

Claim.—1. In a storage battery, a separating device for the successive plates, consisting of a thin layer of wood having parallel rectangular vertical grooves arranged alternately on its opposite sides, and, between them, relatively wide flat spaces, each such space being directly opposite a groove on the other face of said layer, such separator being notched at one end to receive the supporting-rib in the battery-jar whereby such separator may extend below the adjacent plates, to prevent short-circuiting, substantially as set forth.



2. In a storage-battery, a separating device for the successive plates consisting of a thin layer of wood having parallel vertical grooves arranged alternately on its opposite sides, and, between them, plane surfaces substantially wider than said grooves, each such surface being directly opposite a groove on the other face of said layer.

3. In a storage battery, a separating device for the successive plates, consisting of a thin layer of wood having parallel vertical grooves arranged alternately on its opposite sides, and, between them, plane surfaces substantially wider than said grooves, each such surface being directly opposite a groove on the other face of said layer, in combination with a perforated sheet of non-conducting material, as and for the purpose set forth.

4. A porous separator for secondary-battery plates, having on its faces a series of flat surfaces and grooves, said surfaces being substantially wider than said grooves, and the surfaces on one face being opposite the grooves on the other face.

5. A porous separator for secondary batteries, having on each of its faces alternate plane surfaces and grooves, the plane surfaces being substantially wider than the grooves and the plane surfaces on one face being opposite grooves on the other.

6. The combination of a non-conducting perforated sheet adapted to hold the active material in position with a porous separator having on each of its faces alternate plane surfaces and grooves, the plane surfaces being substantially wider than the grooves.

7. The combination of a porous sheet adapted to maintain the active material in position, with a porous secondary-battery separator having on its face alternate plane surfaces and grooves, the plane surfaces being substantially wider than the grooves.

813,583. YARN AND PROCESS OF MAKING THE SAME. CLIFFORD B. POTTER, Springfield, Mass. Filed June 13, 1903. Serial No. 161,300.

Claim.—1. The method of making a cotton and wool yarn which consists in drawing the wool into a sliver, then mechanically subdividing the latter transversely into sections whose length shall equal substantially the length of the cotton fiber, then mixing the fibers and forming the yarn in the usual manner.

2. A yarn composed of cotton and wool fibers, the latter being cut from a sliver into lengths corresponding substantially to the length of the cotton fiber.

3. A yarn composed of cotton and wool fibers, the latter being cut from a sliver into lengths corresponding substantially to the length of the cotton fibers and uniformly distributed therewith throughout the yarn, said wool fibers presenting an extended area of exposed ends.

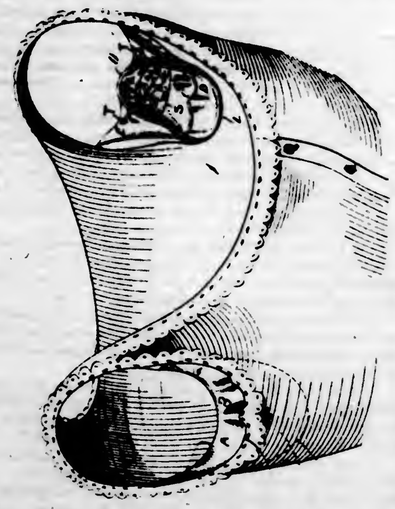
813,584. IRON RAILROAD-TIE. OTIS H. PRIBBLE, Collinwood, Ohio. Filed Nov. 8, 1905. Serial No. 286,361.

Claim.—1. The combination with a railroad-tie having a base-flange and a rail-bearing flange, of a clamping member mounted

upon said rail-bearing flange, said clamping member having a flange engaging the rail and a plurality of flanges engaging opposite sides of said rail-bearing flange, and a wedge engaging the upper face of said clamping member.

2. The combination with a railroad-tie having a base-flange and a rail-bearing flange, of a clamping member mounted upon said rail-bearing flange, said clamping member having a flange engaging the rail and a plurality of flanges engaging opposite sides of said rail-bearing flange, a wedge engaging the upper face of said clamping member, a bolt passing through said wedge, said clamping member and said rail-bearing flange and means for holding said bolt against turning.

818,585. GARMENT. WILLIAM J. REID, Dalton, Pa. Filed Dec. 27, 1904. Serial No. 238,343.



Claim.—1. The combination with a garment having an arm-opening, of a part of the garment adapted to receive and temporarily retain an independently-complete dress-shield, said part being constructed and arranged to form a pocket independently of the material of the garment-body, whereby the garment-body is undisturbed by the existence of the pocket; said pocket being permanently secured to and incorporated with the garment proper by attachment thereto at or near the arm-opening thereof, whereby are avoided all undesirable attachments to the garment-body; and said pocket having a suitable permanently-formed opening adapted for the ready insertion and removal of the independently-complete dress-shield.

2. The combination with a garment having an arm-opening, of a part of the garment adapted to receive and temporarily retain an independently-complete dress-shield, said part being constructed and arranged to form a pocket independently of the material of the garment proper, whereby the garment-body is undisturbed by the existence of the pocket; said pocket being permanently secured to and incorporated with the garment proper by the attachment of its lower or under side to the garment at or near the arm-opening, whereby are avoided all undesirable attachments to the body part of the garment-body; and said pocket having a suitable permanently-formed opening adapted for the ready insertion and removal of the independently-complete dress-shield.

3. The combination with a garment having an arm-opening, of a part of the garment adapted to receive and temporarily retain an independently-complete dress-shield, said part being constructed and arranged to form a complete pocket for the two flaps of the dress-shield, independently of the material of the garment-body, said complete pocket being permanently secured to and incorporated with the garment proper by attachment thereto at or near the arm-opening thereof, whereby are avoided all undesirable attachments to the body part of the garment proper; and said pocket having a suitable permanently-formed opening adapted for the ready insertion and removal of the independently-complete dress-shield.

4. The combination with a garment having an arm-opening, of a part of the garment adapted to receive and temporarily retain an independently-complete dress-shield, said part being constructed and arranged to form a complete pocket for the two flaps of the dress-shield, independently of the material of the garment-body; said pocket being permanently secured to and incorporated with the garment proper by the attachment thereto at or near the arm-opening thereof, of the under side of the pocket, whereby are avoided all undesirable attachments to the body part of the garment proper; said pocket having an opening permanently formed therein at a place other than at the arm-opening.

818,586. RATCHET MECHANISM FOR TOOLS. HUBERT P. RICHARDS, New Britain, Conn., assignor to Stanley Rule & Level Company, New Britain, Conn., a Corporation of Connecticut. Filed Apr. 11, 1905. Serial No. 255,054.

Claim.—1. In a ratchet mechanism for tools, a driving part, a driven part, a spindle carried by one of the parts and rotatably engaging the other part, a pawl-carrying member embracing said spindle and arranged between it and the surrounding wall of said driving part, said pawl-carrying member comprising two independent ring segments or sections, a plurality of pawl-teeth at the lower end of each of said sections, the teeth on one section being faced oppositely to the teeth on the other section, a ratchet on the driven part facing said pawl-teeth and means to retract either of said sections from engagement with said ratchet at will.

2. In a ratchet mechanism for tools, a driving part, a driven part, a spindle carried by one of the parts and rotatably engaging the other part, a pawl-carrying member embracing said spindle and arranged between it and the surrounding wall of said driven part, said pawl-carrying member comprising two independent ring segments or sections, a plurality of pawl-teeth at the lower end of each of said sections, the teeth on one section being faced oppositely to the teeth on the other section, a ratchet on the driven part facing said pawl-teeth, a lateral extension from each section of said pawl member, said extensions projecting into longitudinal grooves or recesses in the surrounding wall of the driving part, and a controlling member cooperating with said sections to retract either of the same at will.

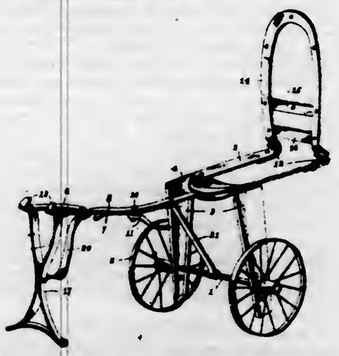
3. In a ratchet mechanism for tools, a driving part, a driven part, a spindle carried by one of the parts and rotatably engaging the other part, a pawl-carrying member embracing said spindle and arranged between it and the surrounding wall of said driving part, said pawl-carrying member comprising two independent ring segments or sections, a plurality of pawl-teeth at the lower end of each of said sections, the teeth on one section being faced oppositely to the teeth on the other section, a ratchet on the driven part facing said pawl-teeth, a lateral extension on each section of said pawl member, said extensions projecting into longitudinal grooves or recesses in the surrounding wall of the driving part, and a controlling-sleeve cooperating with said extensions to retract either of said sections at will from engagement with said ratchet.

4. In a ratchet mechanism for tools, a driving part, a driven part, a spindle carried by one of said parts and rotatably engaging the other part, a sleeve-like extension on said driving part, slots therein, a pawl-carrying member embracing said spindle and bearing between the same and the surrounding wall of the driving part, said pawl-carrying member comprising two independent longitudinally-movable ring segments or sections, a plurality of pawl-teeth on the lower end of each of said sections, the teeth on one section being faced oppositely to the teeth on the other section, a ratchet on the driven part facing said pawl-teeth, lateral extensions on each of the sections of the pawl-carrying member, said extensions projecting through said slots in said sleeve-like extension, and an external cam surrounding said sleeve-like extension and engaging said projections.

5. In a ratchet mechanism for tools, a driving part, a driven part, a spindle on the latter rotatably engaging the former, a sleeve-like extension on the former overstanding the spindle and spaced apart therefrom, a housing, a pawl-carrying member including two independent longitudinally-movable ring segments or sections between the spindle and the inner wall of said sleeve-like extension, a plurality of teeth on the lower end of each of said sections, the teeth on one section being faced oppositely to the teeth on the other section, a ratchet on the driven part and means to cause both of said sections to normally move into engagement with said ratchet, and manually-controllable means to permit either of said sections to be retracted from operative engagement with said ratchet at will.

6. In a ratchet mechanism for tools, a driving part, a driven part, a spindle on the latter rotatably engaging the former, a sleeve-like extension on the former overstanding the spindle and spaced apart therefrom, a housing, a pawl-carrying member including two independent longitudinally-movable ring segments or sections between the spindle and the inner wall of said sleeve-like extension, a plurality of teeth on the lower end of each of said sections, the teeth on one section being faced oppositely to the teeth on the other section, a ratchet on the driven part and means to cause both of said sections to normally move into engagement with said ratchet, and manually-controllable means to permit either of said sections to be retracted from operative engagement with said ratchet at will, said means comprising a sleeve-like controlling member having a cam at its inner side, and a projection on each of said sections passing through a slot in said sleeve-like driven extension and coöperating with said cam.

818,587. BARREL-STAND. CONSTANCE A. RIEK, Hermann, Mo., assignor of one-half to Charles H. Scheuerman, Hermann, Mo. Filed May 4, 1905. Serial No. 258,758.



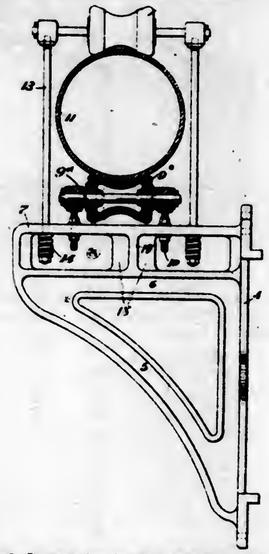
Claim.—1. A barrel-stand, having a support for a side of a barrel mounted therein, said support comprising a plurality of adjustable sections, hooks carried by the outer ends of said sections to engage the chime at the opposite ends of the barrel and means at an approximately right angle to the first-named support for engaging and supporting one end of the said barrel.

2. A barrel-stand, having a support for the side of a barrel mounted therein, comprising a plurality of U-shaped sections adjustably secured together and a U-shaped section rigidly secured to the free ends of one of the U-shaped sections, at an approximately right angle thereto.

3. A barrel-stand, having a support for the side of a barrel mounted therein and a support at right angles thereto for one end of the barrel and a wheel-supported frame adapted and arranged to be secured at the option of a user to the side support or to the end support.

4. A barrel-stand, having a support for the side of a barrel mounted therein and a support at right angles thereto for the end of a barrel, a wheel-supported frame adapted and arranged to be secured at the option of a user to the side support or to the end support and a supplemental supporting frame or brace adapted to be secured at the option of the user to one end of either the side support or the end support.

818,588. ADJUSTABLE PIPE-BRACKET. JOHN B. ROLLINS, Chicago, Ill., assignor to Crane Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 28, 1905. Serial No. 247,661.



Claim.—1. In a pipe bracket the combination of a fixed horizontal bracket, and pipe holding and clamping devices mounted on said bracket, said devices including vertical adjusting screws for varying the elevation, engaging the fixed bracket adjustably in a horizontal direction, substantially as described.

2. In a pipe bracket the combination of a supporting webbed bracket having a slotted top plate, clamping devices mounted for adjustment vertically and horizontally thereon, and comprising vertical adjusting screws passing through the slot of the top plate, and the said slot being in the median line of the plate, substantially as described, whereby the pipe is supported directly over the web of the bracket.

3. In a pipe bracket, the combination with an attaching base plate 4 and a horizontal top plate 7 having open slots 7° in the median line thereof, of a web 5 and a horizontal flange attached thereto beneath the top plate and spaced apart therefrom to leave open spaces between the flange and plate, whereby attaching devices for the pipe may be passed through the slot in the top plate and their ends manipulated in the space under the top plate.

4. In a pipe bracket, the combination with adjustable pipe holders 9 and 12, bolts 10 and 13 and nuts for supporting said holders, of a bracket having a top plate with slots 7° at the median line thereof, and a web with open spaces in communication with said slots, beneath said top plate, said bolts extending through said slots and said open spaces receiving said nuts and the lower ends of said bolts.

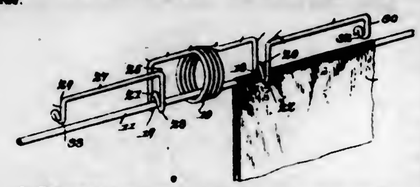
5. The combination with a bracket having a vertical web and a centrally slotted top flange plate, and open spaces 8 in the web under said top plate, of a pipe support carried by said bracket comprising bolts 10 engaging the slots in said plate and nuts for adjusting their position therein, whereby the weight of the pipe may be supported over the median line of the bracket and the pipe support may be adjusted both vertically and laterally on the bracket.

6. A pipe bracket comprising the combination of a vertical face plate, a supporting arm and a horizontal plate above and spaced from said supporting arm, said horizontal plate being provided in its median line with slots communicating with the space beneath, bolts extending through said slots and adjustable therein vertically and laterally and adapted to carry a pipe supported at their upper ends, substantially as described.

818,589. CLOTHES-PIN. HENRY I. RUMFORD and JAMES R. DOUGLASS, Willowdale, Tex. Filed Aug. 4, 1905. Serial No. 272,786.

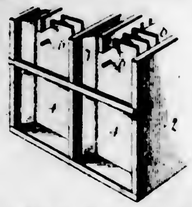
Claim.—1. The combination with a clothes-line, of a clothes-pin having a resilient coil encircling the line, means held in contact with

the line at opposite sides of and by the resiliency of the coil and means whereby the line may be engaged at an additional point at either side.



2. The combination with a clothes-line, of a clothes-pin having a resilient coil encircling the line, riders held in resilient contact upon the line at opposite sides and by the resiliency of the coil and arms carried by the riders and having terminal hooks arranged to engage under the line.

813,590. MOLD FOR MOLDING TILES AND SIMILAR ARTICLES. FRANK M. SAWYER, Charlotte, N. C. Filed Aug. 31, 1905. Serial No. 276,666.



Claim.—1. A mold of the character described comprising a plurality of spaced-apart mold-sections each of which is provided with a forwardly-projecting pin or plug located near one end thereof and contacting with the rear surface of the next adjacent section, whereby said sections are properly spaced and nail-holes formed in the tiles.

2. A mold of the character described comprising a plurality of mold-sections each provided with side flanges, supporting means for engaging said flanges, and independent means carried by each section for spacing said sections and also forming a hole or opening in the article to be cast.

3. A mold of the character described comprising a plurality of mold-sections each provided with side flanges and a forwardly-projecting plug located between said flanges, and contacting with the rear surface of the next adjacent section, whereby said sections are properly spaced and nail-holes formed in the tiles, and means for securing said mold-sections in juxtaposition.

4. A mold-section of the character described comprising a flat body provided with side flanges, and a forwardly-projecting combined spacing and core plug located between said flanges near the upper end of said body.

5. In combination with a mold-box, transverse mold-pieces to lie between the side members thereof and provided with studs, said studs projecting laterally from said transverse mold-pieces and serving to space them apart.

813,591. OIL-CUP. GUSTAV C. SONNEBORN, Hartford, Conn., assignor to The Whitney Company, Hartford, Conn., a Corporation of Connecticut. Filed June 20, 1904. Serial No. 213,766.

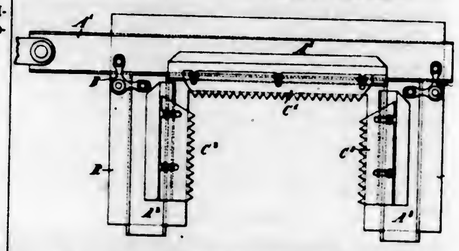
Claim.—1. In an oil-cup, the combination of an oil-receiving body, a cover, comprising an annular head provided with a hole for filling the cup, and attached to the body by a reduced interior stem integral with the head, and a rotatable cap mounted on the cover to open and close the said hole.

2. In an oil-cup, the combination of an oil-receiving body, a cover, comprising an annular head provided with a hole for filling the cup, and attached to the body by a reduced interior stem integral with the head, a rotatable cap mounted on the cover to open and close the said hole, and a spring seated between the head and cover for retaining them in relative position.

3. A self-closing oil-cup, comprising an oil-receiving body portion, a cover comprising an annular head attached to the body by a reduced interior stem and provided with a hole for filling the cup, a rotatable cap mounted on the cover to open and close the hole, and a spring intermediate the cover and cap for yieldingly holding the cap in its closing position.

4. In an oil-cup the combination of an oil-receiving body, a cover comprising an annular head provided with an angularly-disposed filling-hole, and attached to the body by a reduced interior stem integral with the head, and a rotatable cap provided with a hole registering with that of the head in one position, and mounted upon the said head to open and close the hole in said head.

813,592. APPARATUS FOR THE PRODUCTION OF LINE DESIGNS ON BRICKS, &c. CHRISTIAN W. SØNDU, Antvorskov, near Slagelse, Denmark. Filed Apr. 24, 1905. Serial No. 257,230.



Claim.—1. Apparatus for the production of designs upon the surface of moving clay masses, comprising a marking device, means for supporting same and means for reciprocating said marking device, said marking device being in continuous contact with the moving clay mass, substantially as described.

2. Apparatus for the production of designs upon the surface of moving clay masses, comprising marking devices, means for supporting same and means for reciprocating said marking devices, said marking devices being in continuous contact with the moving clay mass, substantially as described.

3. Apparatus for the production of designs upon the surfaces of moving clay masses, comprising a frame, marking devices secured in holders adapted to slide in said frame and means for imparting motion to said holders, whereby each marking device travels longitudinally in one plane, substantially as described.

4. In an apparatus for the production of designs upon the surface of moving clay masses, the combination with a main part, of a support adapted to slide in said support and means for causing the travel of said marking device longitudinally in one plane, substantially as described.

5. In an apparatus for the production of designs upon the surfaces of moving clay masses, the combination with a frame, of a plurality of sliding supports mounted in said frame, angularly disposed to each other, marking devices mounted in said supports and means for simultaneously reciprocating said supports whereby at least two of said marking devices will move in opposite directions and score two or more surfaces, of the moving clay masses angularly disposed to each other, substantially as described.

6. In an apparatus for the production of designs upon the surfaces of moving clay masses, the combination with a frame, of sliding supports mounted in said frame and angularly disposed to each other, marking devices mounted in said supports and means for reciprocating said supports and marking devices, whereby two or more surfaces of the moving clay mass, angularly disposed to each other, are simultaneously scored, substantially as described.

7. Apparatus for the production of designs upon the surface of moving clay masses, comprising marking devices, means for supporting same in an inclined position and means for reciprocating said marking devices, substantially as described.

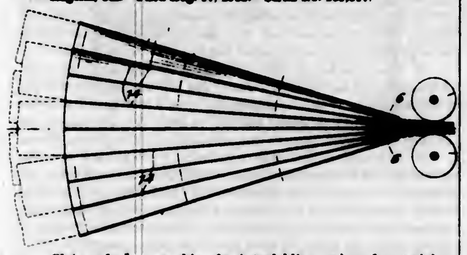
8. A device of the kind described, provided with marking devices producing a series of wavy parallel scores and means for operating said marking devices, substantially as described.

9. A device of the kind described provided with marking devices for producing a series of continuous wavy parallel scores and means for operating said marking devices, substantially as described.

10. In a device of the kind described, the combination with a frame, of a plurality of marking devices angularly disposed and slidably mounted therein, bell-crank levers connecting said marking devices and means for imparting motion to one of said marking devices, substantially as described.

11. Apparatus for the production of designs upon the surfaces of moving clay masses comprising a frame provided with grooves, bars adapted to slide in said grooves, a lever actuating one of said bars, a bell-crank lever and serrated plates adjustably secured to said bars, substantially as described.

813,593. PAPER-FOLDING MACHINE. ARTHUR B. SEXTON, Los Angeles, Cal. Filed Aug. 17, 1903. Serial No. 169,617.



Claim.—1. In a machine for interfolding strips of material, a pair of superposed sectors, each including a body portion, and a plurality of convergent partitions of contracted width, the spaces between said partitions affording passages in which the strips may be curved transversely, and interfolded with each other without frictional contact of the partitions with the entire area of the strips, the body portions of the sectors engaging with the central portions of the strips being folded.

2. In a machine for interfolding a plurality of strips, a pair of sectors having folding and guiding devices for the outer strips, intermediate strips serving to mutually sustain each other.

3. In a paper-folding machine, a pair of sectors having strip folding and guiding members less in number than the number of strips to be folded.

4. In a paper-folding machine, a pair of sectors, and partitions carried thereby, the distance between the sectors at the entrance end being greater than the distance between each sector and the edges of the partitions of the opposite sector at the discharge end.

5. In a machine for interfolding a plurality of strips, a pair of sectors having edge plates and intermediate partitions, the edge plates being continued beyond the ends of said partitions to form a contracted discharge-mouth.

6. In a paper-folding machine a pair of sectors having paper folding and guiding partitions, one of said sectors being formed of a plurality of longitudinally-extending and transversely-separable sections.

813,594. PAPER-HOLDER. ARTHUR B. SEXTON, Los Angeles, Cal. Filed Dec. 26, 1903. Serial No. 186,726.

Claim.—1. In a holder for interfolded paper, a slotted discharge-plate having a recess forming an enlarged throat for the slot, and means for forcing the paper into contact with the inner surface of said plate.

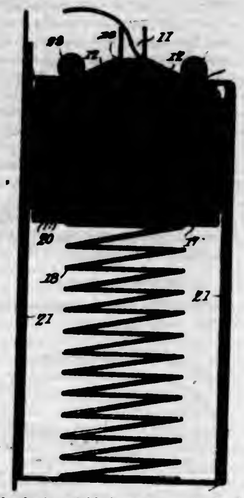
2. In a holder for interfolded paper, a discharge-plate extending outward to form a recess into which the paper may bulge and having a discharge-slot the walls of which are extended outward to hold the sheets projected at an angle to the plate.

3. In a holder for interfolded paper, a plate having a discharge-slot, the walls of which are of greater area than the thickness of the plate and serve to hold the sheets projected at an angle to said plate, there being finger-notches formed in said walls.

4. In a holder for interfolded paper, a casing having a top discharge-slot, a paper-supporting plate, a spring exerting upward pressure on the plate, and a plurality of removable weight-plates carried by said paper-supporting plate.

5. In a holder for interfolded paper, a casing including a wall having a discharge-slot, and a pair of rollers arranged one on each side of the slot for independent engagement with the sheets of paper.

6. In a holder for interfolded paper, a casing having a discharge-slot and provided with auxiliary slots or openings on each side thereof, and auxiliary feeding-rolls having portions of their peripheries extending through the auxiliary slots and adapted for independent engagement with the sheets of paper.



7. In a holder for interfolded paper, a casing having a discharge-slot, and a pair of rollers disposed one on each side of the slot and adapted respectively to feed the paper in opposite directions toward said slot.

8. In a holder for interfolded paper, a casing having a discharge-slot, and a pair of rollers having roughened peripheries, said rollers being disposed one at each side of, but beyond the walls of the slot, said rollers having terminal operating-knobs.

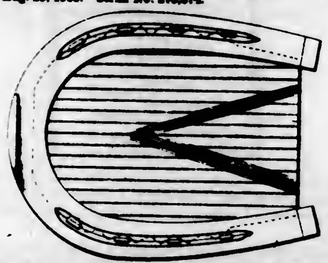
813,595. LATCH DEVICE. CALEB C. SHIVE, Frederick, Okla. Filed Mar. 1, 1905. Serial No. 247,864.

Claim.—1. In a latch device, the combination of oppositely-operated latch-bolts, an actuator comprising spaced plates, attaching members journaled between the plates, rods connected with the latch-bolts and having adjustable connection with said attaching members, and means for operating the actuator.

2. In a latch device, the combination of oppositely-operating latch-bolts, an actuator comprising spaced plates, attaching members journaled between the plates, rods connected with the latch-bolts and having adjustable connection with said attaching members, a lever for operating the actuator, and means for limiting the movement of the actuator relative to the connecting-rods aforesaid.

3. In a latch device, the combination of oppositely-operating latch-bolts provided with sockets at one end, an actuator comprising spaced plates, a journal-pin for the actuator, attaching members journaled between the spaced plates of the actuator and having transverse openings therethrough, rods having one end received in the socket of each latch-bolt, and an opposite end passed through the transverse opening in an attaching member of the actuator, a set-screw carried by the attaching members for adjusting the connection of the rods therewith, a lever extended from one of the spaced plates of the actuator for operation of the latter, and a projection carried by the lever for limiting the movement thereof.

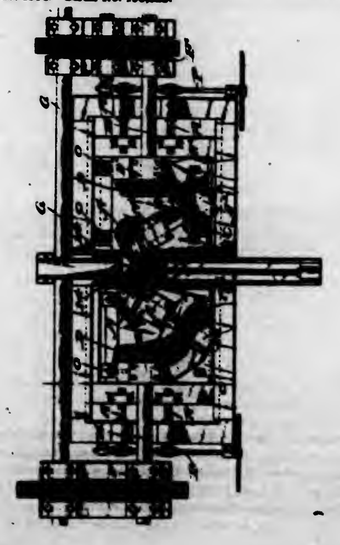
813,596. **HORSESHOE.** JOHN H. STUPENDICHER, St. Louis, Mo. Filed Aug. 23, 1905. Serial No. 275,274.



Claim.—1. A protecting-plate for a horse's hoof, consisting of a metal plate corrugated longitudinally and adapted to lie over the bottom of the hoof and cover the same and be positioned over the shoe.

2. A protecting-plate for a horse's hoof, consisting of a metal plate adapted to cover the bottom of the hoof, and corrugated longitudinally, and having notches in the side edges to straddle the shoe-nails when placed in position whereby the plate is held against longitudinal displacement.

813,597. **APPARATUS FOR ROLLING TUBES AND TUBULAR BODIES.** RALPH C. STRETCH, Elwood City, Pa., assignor to National Tube Company, New York, N. Y., a Corporation of New Jersey. Filed Feb. 27, 1904. Serial No. 195,333.



Claim.—1. In a rolling-mill, the combination of two rolls forming a converging and a diverging pass, and a piercing or expanding mandrel in the pass, the two rolls being symmetrically placed on opposite sides of the axis of said mandrel and skewed in respect thereto, and having progressively-larger diameters presented to the billet as it progresses through the pass and also having greater feeding effects at the diverging portion of the pass.

2. In a rolling-mill, rolls, roll-shafts, driving-shafts, the axes of which lie in a line perpendicular to and intersecting the pass, said roll-shafts being mounted obliquely to the said driving-shafts and having driving connections therefrom, and means for adjusting the roll-shafts about the axes of the said driving-shafts.

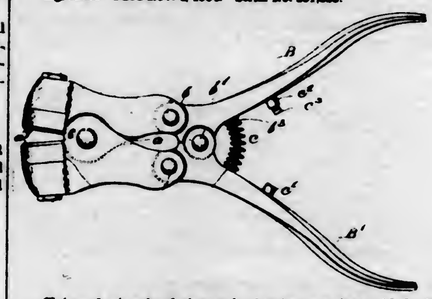
3. In a rolling-mill, rolls, roll-shafts, driving-shafts, the axes of which lie in a line perpendicular to and intersecting the pass, said roll-shafts being mounted obliquely to the said driving-shafts and having bevel-gear connections with the driving-shafts, and means for adjusting the roll-shafts about the said driving-shaft axes.

4. In a rolling-mill, rolls, roll-shafts, driving-shafts, the axes of which lie in a line perpendicular to and intersecting the pass, said roll-shafts being mounted obliquely to the said driving-shafts, housings mounted to rock about the driving-shaft axes as centers, and driving connections between the roll-shafts and the driving-shafts.

5. In a rolling-mill, rolls, roll-shafts, driving-shafts, the axes of which lie in a line perpendicular to and intersecting the pass, said roll-shafts being mounted obliquely to the said driving-shafts, housings in which the said roll-shafts are mounted, driving connections between the roll-shafts and the driving-shafts, and means for adjusting the housings along the axial line of the driving-shafts.

6. In a rolling-mill, rolls, roll-shafts, driving-shafts, the axes of which lie in a line perpendicular to and intersecting the pass, said roll-shafts being mounted obliquely to the said driving-shafts, housings in which the said roll-shafts are mounted, driving connections between the roll-shafts and the driving-shafts, and screw connections for adjusting said housings along the axial line of the driving-shafts

813,598. **CUTTING MECHANISM.** WILLIAM A. SYLVESTER, Reading, Mass. Filed Nov. 4, 1904. Serial No. 231,288.



Claim.—1. A pair of nippers having jaws, each provided with a detachable cutting-bit having an arc-shaped or circular cutting edge, disposed transversely thereof.

2. In a pair of nippers, two opposed jaws, and cutting-bits having arc-shaped edges detachably secured to said jaws and incapable of adjustment thereon said arc-shaped edges being disposed transversely of the jaws.

3. In cutting-nippers, a pair of pivoted jaws each having a flat side face, a cutting-bit detachably secured to each jaw, each cutting-bit having a flat side in alinement with the flat face of the corresponding jaw, and an arc-shaped cutting edge disposed transversely of the jaw.

4. In cutting-nippers, a pair of pivoted jaws, each having a flat side face, and a cutting-bit detachably secured to each jaw but incapable of adjustment thereon, each cutting-bit having an arc-shaped cutting edge disposed transversely of the jaw, and a flat side in alinement with the flat face of the jaw.

5. In cutting-nippers, a pair of pivoted jaws, each jaw having a flat side face, and a cutting-bit detachably secured to each jaw, each cutting-bit having a flat side in alinement with the flat face of the jaw, and an arc-shaped edge extending transversely to the jaws.

6. In cutting-nippers, a pair of pivoted jaws movable toward and from each other, a cutting-bit detachably secured to the inner face of each jaw, each cutting-bit having an arc-shaped cutting edge which is transverse to the longitudinal axis of the nippers.

7. In cutting-nippers, a pair of pivoted jaws, each having a rounded end, and a cutting-bit detachably secured to the inner face of each jaw, each cutting-bit having a circular cutting-edge corresponding in contour to the rounded edge of the nipper.

813,599. **WATER-CLOSET FLUSH-TANK.** GILBERT S. THOMPSON, Cedar Rapids, Iowa. Filed June 14, 1904. Serial No. 212,861.

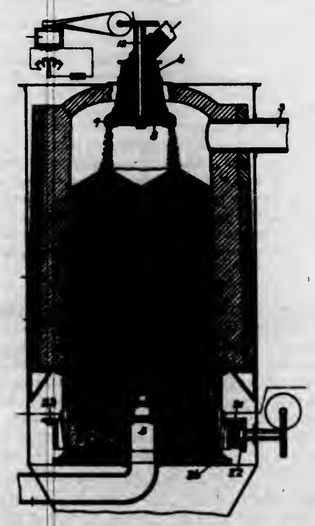
Claim.—1. The combination of a permanent flush-tank forming a cistern for water not under pressure, suitable feed and discharge pipes therefor, and a removable ornamental casing therefor adapted to inclose and conceal the water-tank on all sides exept the back and bottom.

2. In a flush-tank, the combination of a water-tank provided with supports for an outer casing, a removable outer casing, and cleats thereon to engage said supports.

3. In a flush-tank, the combination of a water-tank, a removable outer casing therefor, and inclined cleats to support the casing on the tank and close to the wall behind it.

4. The combination with a permanent water-tank forming a cistern for water not under pressure, suitable feed and discharge pipes therefor, a removable ornamental casing for said tank, adapted to cover and conceal the same on all sides except the back and bottom, supporting-cleats for said casing inside thereof, and engaging cleats on the tank, the feed or service pipe passing up between the tank and casing, and discharging into the tank at the top.

813,600. **GAS-PRODUCER.** EDWARD N. TRUMP, Syracuse, N. Y. Filed Nov. 21, 1904. Serial No. 233,609.



Claim.—1. The combination of a stationary receptacle comprising a cylinder having a vertical extension and a table spaced below the lower extension of the cylinder, a deflector projecting beneath the cylinder and over the table, a support for said deflector located without the receptacle, and means for causing the said support to travel around the receptacle.

2. The combination of a stationary combustion-chamber, a stationary table spaced below the lower extension thereof, a rotatable member located without the periphery of said table and combustion-chamber, means for causing the rotation of said member, and a deflector carried by said rotating member projecting over the table from the circumference toward the center thereof.

3. The combination of a combustion-chamber, a stationary table spaced below the lower extension thereof, a deflector adapted to rotate about an axis corresponding to the center of the table, a member located outside of the periphery of said table for supporting the said deflector, and means for causing the gradual rotation of said supporting member.

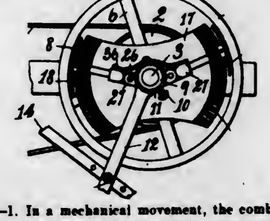
4. The combination of a combustion-chamber, a stationary table spaced below the lower extension thereof, a rotatable body surrounding the chamber, and a deflector supported by said rotatable body for sweeping said table being so positioned and rotated and having such curved contact-face that the angle between the tangent of the curve and the radius of its rotation shall be the same at every point of intersection of radius and curve.

5. The combination of a combustion-chamber, a stationary platform spaced below the lower extension thereof, a deflector for sweeping said table, a rotatable member surrounding said combustion-chamber for supporting said deflector at its outer extension and means for causing the gradual rotation of said supporting member.

6. The combination of a combustion-chamber, a stationary platform spaced below the lower extension thereof, a deflector for sweeping said table, a rotatable member surrounding said combustion-chamber for supporting said deflector at its outer extension and regulatable means for causing the gradual rotation of the same.

7. In a continuously-operated gas-producer, the combination with regulatable mechanism for feeding fuel thereto, a combustion-chamber, a stationary table spaced below the lower extension thereof, a deflector adapted to rotate about an axis corresponding to the center of the table, a member, located outside of said chamber for supporting the said deflector, and means for causing the gradual rotation of said supporting member.

813,601. **MECHANICAL MOVEMENT.** LOUIS R. TULLOCH, Angels Camp, Cal. Filed Mar. 11, 1904. Serial No. 197,723.

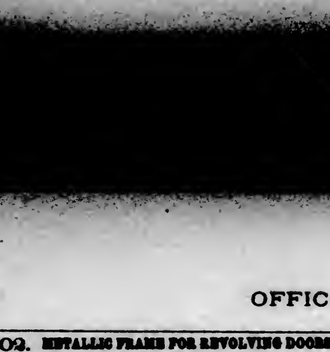


Claim.—1. In a mechanical movement, the combination of a shaft, a friction-ring secured thereon, a sleeve mounted loosely on said shaft, an extension therefrom, an arm having its inner end engaged by the outer end of said extension, said arm rocking about said outer end, a friction-shoe carried by the outer end of said arm, and arranged to engage said friction-ring, and means for rocking said sleeve to bring said shoe into and out of engagement with the friction-ring, substantially as described.

2. In a mechanical movement, the combination of a shaft, a friction-ring secured thereon, a sleeve loose on said shaft, extensions from said sleeve, arms having their inner ends engaged by the outer ends of said extensions, said arms rocking about said outer ends, friction-shoes carried by the outer ends of said arms and engaging said friction-ring, and means for rocking said sleeve, substantially as described.

3. In a mechanical movement, the combination of a shaft, a friction-ring secured thereon, a sleeve loosely mounted on said shaft, means for rocking said sleeve, segment-gears carried by said sleeve, extensions from said sleeve, arms having their inner ends engaged by the outer ends of said extensions, said arms rocking about said outer ends, stems rotatably carried by the outer ends of said arms, and threaded at their outer ends, pinions on said stems engaging said gears, nuts engaged by said threaded ends, and friction-shoes to which said nuts are pivotally attached said friction-shoes engaging said ring, substantially as described.

813,602. **METALLIC FRAME FOR REVOLVING DOORS.** THEODORUS VAN KANNEL, New York, N. Y., assignor to Van Kannel Revolving Door Company, New York, N. Y., a Corporation of West Virginia. Filed Aug. 15, 1904. Serial No. 220,844.

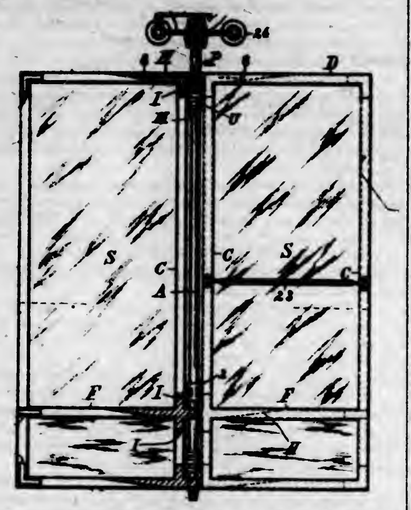


upper rail of the wing-frame, and auxiliary arms extended into the lower rails of the wing-frame, each auxiliary arms being mortised into the metallic stile and secured thereto.

rods, a centrally-disposed pivot-rod connecting said bars, a frame pivoted upon said pivot-rod, a feed box or hopper upon said pivoted

vancing the bearing-plate the length of said conical end, means for causing the rolls to move parallel to the end during said advance, and

813,602. METALLIC FRAME FOR REVOLVING DOORS. THEODORE VAN KANNEL, New York, N. Y., assignor to Van Kannel Revolving Door Company, New York, N. Y., a Corporation of West Virginia. Filed July 22, 1905. Serial No. 270,702.



Claim.—1. In a revolving door, the combination, with the center spindle, of metallic arms attached rigidly to the spindle and projected in opposite directions from the spindle, and two opposite wing-frames mounted upon the said arms.

2. In a revolving door, the combination, with the center spindle, of arms having their butt-ends fitted respectively to opposite sides of the spindle and clamped together upon the spindle, the arms projecting in opposite directions from the spindle and having opposite wing-frames mounted thereon.

3. In a revolving door, the combination, with the center spindle, of arms having their butt-ends notched into the said spindle at opposite sides and clamped together upon the said spindle, the arms projecting in opposite directions from the spindle and having opposite wing-frames mounted thereon.

4. In a revolving door, the combination, with a center spindle and opposite wing-frames having tubular rails, of metallic arms attached rigidly to the spindle and projected in opposite directions from the spindle and fitted within the said rails.

5. In a revolving door, the combination, with the center spindle and opposite wing-frames having tubular rails, of metallic arms attached rigidly to the spindle and projected in opposite directions from the spindle into the said rails, the arms being tapered upwardly upon the under side to lighten them, substantially as herein set forth.

6. In a revolving door, the combination, with a center spindle and opposite wing-frames having tubular stiles and rails, of metallic arms attached rigidly to the spindle and projected in opposite directions from the spindle and fitted within the said rails and having tubular elbows fitted within the stiles.

7. In a revolving door having metallic wing-frames, the combination, with the center spindle, of a wing-frame carrier consisting of a metallic stile having an upper arm projected rigidly therefrom and extended within the upper rail of the door-frame, and means for mounting the said carrier upon the spindle.

8. In a revolving door having metallic wing-frames, the combination, with the center spindle and hinge-lugs thereon, of a wing-frame carrier consisting of a metallic stile hinged to the said lugs, and having an upper arm projected rigidly therefrom and extended within the upper rail of the wing-frame.

9. In a revolving door having metallic paneled tubular wing-frames, the combination, with the center spindle and hinge-lugs thereon, of a wing-frame carrier consisting of a metallic stile hinged to the said lugs and having a rigid upper arm projected within the upper rail of the wing-frame, and auxiliary arms projected into the lower panel-rails of the frame.

10. In a revolving door, the combination, with a metallic paneled wing-frame formed of metallic tubes, of a wing-frame carrier comprising a metallic stile with rigid upper arm extended into the upper rail of the wing-frame, and auxiliary arms extended into the lower rails of the wing-frame, such auxiliary arms being mortised into the metallic stile and secured rigidly therein.

11. In a revolving door, a carrier for tubular metallic wing-frames comprising the metallic stile J having the upper integral arm K fitted snugly within the frame, and lower arms composed each of a plurality of bars mortised into the stile and secured rigidly therein, to fit within the lower rails and resist lateral flexure.

12. In a revolving door having tubular metallic wing-frames, the combination, with the joints of the rails and stiles, of tubular ties secured firmly within the ends of the rails and within the breadth of the stile, substantially as herein set forth.

13. In a revolving door, the combination, with the center spindle having a hinge-sleeve with a plurality of hinge-lugs thereon, of a tubular wing-frame, and a frame-carrier having a metallic stile with arms extended into the rails of the wing-frame, and hinge-plates secured rigidly to the said stile and having hinge-lugs to engage the hinge-lugs upon the center spindle.

14. In a revolving door, the combination, with the center spindle, of the means for hinging the wing-frame thereon, consisting of the sleeve U provided with the series of collars M formed at opposite sides with hinge-lugs, and hinge-lugs N upon the door-frame adapted to engage the same.

15. In a revolving door, the combination, with a tubular center spindle and door-wings having hinge-lugs near the top and bottom, of hinge-sleeves bored to fit upon the spindle and having collars with hinge-lugs to engage the lugs upon the wings, and means for securing the hinge-sleeves upon the spindle at suitable points.

16. In a revolving door, the combination, with a tubular center spindle with door-wings carried thereby and having the slot 1 as set forth, of a handle Z with sleeve 2 fitted to slide on the spindle over the slot, the link 4 having connection to the handle through the slot, and the step-bolt B having swivel connection with the link, whereby the step-bolt may be reciprocated in the spindle, and the spindle rotated without turning the step-bolt.

17. In a revolving door having a center spindle with wings hinged thereto, the combination, with a tubular center spindle having the slot 1 as set forth, of hinge-sleeves U secured thereon at intervals and having the hinge-lug collars M, the plates 18 and 19 forming a box around such collars and having the slot 21 in line with the slot 1 upon the spindle, the handle Z extended through the slot 21 and having the sleeve 2 fitted to slide on the spindle, the link 4 movable within the spindle, the pin 3 connecting the handle with the link, the step-bolt B movable with the link, and the rod Y extended from the top of the link to actuate the locking-plate at the head of the spindle.

18. In a revolving door having a center spindle with wings carried thereby, the combination, with a tubular spindle having notches Q in its opposite sides, of arms having their butt-ends fitted to the said notches and projected in opposite directions to stiffen the wing-frames, bolts clamping the arms together upon the spindle, and the reinforcing-plug X fitted to the bore of the spindle between the notches to stiffen the same.

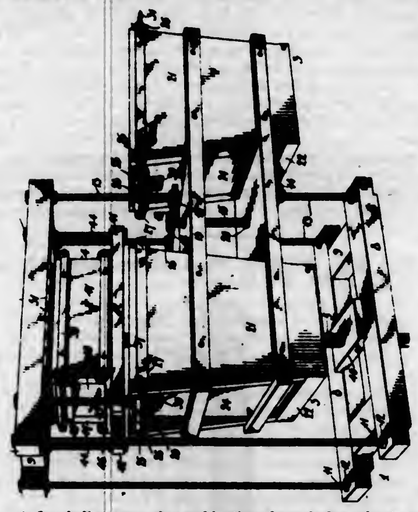
19. In a revolving door having tubular spindle with wings carried thereby, the combination, with the spindle having slot 1 as set forth, of a link within the spindle and a handle connected with the same through the slot 1, the bolt B having swivel connection with the link and provided in the end with the notch 10, and a step fitted to the step-bolt and having transverse pin 9 to engage the notch 10, whereby the bolt may remain stationary when the spindle and wings are revolved.

813,603. BALING-PRESS. GEORGE M. WASHINGTON, Houston, Tex. Filed Sept. 5, 1905. Serial No. 277,602.

Claim.—1. The combination of a main frame or support, a horizontally-swinging frame therein, a hopper upon said swinging frame, adjustable sides or ends in said hopper, a sliding bottom in said hopper, a bale-box mounted in the upper portion of said main frame, and a plunger mounted in the lower portion of said main frame and adapted to operate the movable bottom in said hopper to compress the contents of the latter in said bale-box, substantially as described.

2. In a baling-press, the combination of a main frame consisting of top and bottom portions, rods projecting from said portions, plates or bars connecting said rods, a pivot-rod connecting said plates and a swinging hopper-carrying frame upon said pivot-rod, substantially as described.

3. In a baling-press, the combination of a main frame comprising top and bottom portions connected at one end, rods projecting from the opposite end of said portions, parallel bars connecting said rods, a centrally-disposed pivot-rod connecting said bars, a frame pivoted upon said pivot-rod, a feed box or hopper upon said pivoted frame, a bale-box suspended from the top portion of the main frame and a plunger mounted in the bottom portion of said main frame, substantially as described:



4. In a baling-press, the combination of a main frame having a base and a top, each consisting of longitudinal beams connected by cross-bars, rods connecting said longitudinal beams at one end, rods projecting from said beams at their other ends, bars connecting the last-mentioned rods, a pivot-rod connecting said bars, a horizontally-swinging frame pivoted upon said pivot-rod, feeding boxes or hoppers mounted upon said swinging frame, swinging ends in said hoppers, sliding bottom in said hoppers, a frame depending from the top of said main frame, a baling-box mounted upon said depending frame and having movable sides and ends, and a plunger mounted in the bottom of said main frame, substantially as described.

5. In a baling-press, the combination with a baling-box and a plunger, of a feeding box or hopper having a swinging wall formed with a groove, a slide in said groove, an eccentric-strap upon said slide, and an eccentric extending through said strap and journaled upon said hopper, substantially as described.

6. In a baling-press, a feeding box or hopper comprising side walls, end walls pivotally mounted between said side walls and formed with grooves, sliding blocks mounted in said grooves, eccentric-straps connected to said blocks, brackets upon said side walls, shafts journaled in said brackets, eccentrics upon said shafts and mounted in said straps, and means for rotating said shafts, substantially as described.

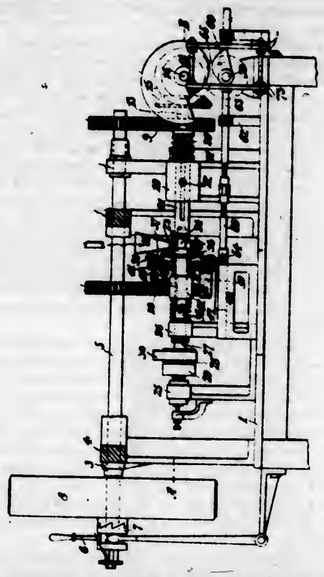
7. In a baling-press, a feeding box or hopper having a swinging wall, an eccentric mounted upon said hopper, and an eccentric-strap engaged with said eccentric and with said swinging wall, substantially as described.

813,604. MACHINE FOR THE MANUFACTURE OF CAPSULES FOR BOTTLES. EDUARD WATZEK, Friedberg, Austria-Hungary, assignor of one-half to Ignaz Hagy, Friedberg, Austria-Hungary. Filed Dec. 24, 1902. Serial No. 136,469.

Claim.—1. In a machine for making capsules, the combination of a rotatable spindle having a capsule-forming end portion, a plurality of stretching-rolls, a non-revolvable bearing-plate therefor, a yoke, a rod connecting said yoke and plate and a cam revolvable in said yoke, for the purpose specified.

2. In a machine for making capsules, the combination of a rotatable spindle having a capsule-forming end portion, a plurality of stretching-rolls, a non-revolvable bearing-plate therefor, a yoke, an adjustable rod connecting said yoke and plate, and a cam revolvable in said yoke, for the purpose specified.

3. In a machine for making capsules, the combination with a conical-ended rotatable spindle, of a non-revolvable bearing-plate, a plurality of stretching-rolls mounted on the latter, means for advancing the bearing-plate the length of said conical end, means for causing the rolls to move parallel to the end during said advance, and means to spread said rolls simultaneously with the return of the bearing-plate.



4. In a machine for making capsules, the combination with a receiving-spindle and mechanism for rotating the same, of a stretching mechanism comprising a bearing-plate having a plurality of slots and adapted to surround the spindle, means for moving the plate parallel to the axis of the spindle, a plurality of levers pivotally mounted on the plate axially of the slots, a pressure-roll mounted in each lever, a pin on the levers projecting through said slots, a disk mounted on the plate provided with slots engaging said pins, and means for rotating the disk, substantially as and for the purpose specified.

5. In a machine for making capsules, the combination with a rotatable spindle having a capsule-forming end portion, a non-revolvable bearing-plate surrounding said spindle, a plurality of stretching-rolls pivotally mounted on said bearing-plate, means for advancing the latter the length of the forming portion, and means for automatically returning the same, of a disk rotatable on the bearing-plate, mechanism connecting the rolls and disk, means for rotating the latter on the advance and on the return of the bearing-plate.

6. In a machine for making capsules, the combination with a rotatable spindle having a capsule-forming end portion, a non-revolvable bearing-plate having a central aperture surrounding the spindle, a plurality of stretching-rolls pivoted on said plate around the aperture, means for advancing said plate the length of the forming portion, and means for automatically returning the same, of a disk rotatably mounted on the plate, mechanism connecting the rolls and disk, an abutment on the disk and on the plate, a resilient connection between said abutments and means for rotating the disk on the advancement of the plate, for the purpose specified.

7. In a machine for making capsules, the combination with a rotatable spindle having a capsule-forming end portion, a bearing-plate surrounding said spindle, stretching-rolls pivotally mounted on said plate, means for advancing the latter the length of the forming portion, and means for automatically returning the same, of a disk rotatably mounted on the plate, mechanism connecting the rolls and disk, an abutment on the disk and on the plate, means for engaging the disk-abutment upon the advance of the plate, and a spring connecting said abutments adapted to exert pressure thereon during said advancement.

8. In a machine for making capsules, the combination with a rotatable spindle having a capsule-forming end portion, a bearing-plate surrounding said spindle, stretching-rolls pivotally mounted on said plate, means for advancing the latter the length of the form-

ing portion, and means for automatically returning the same, of a disk rotatably mounted on the plate adapted to control the movement of said rolls, an abutment on the disk, means to hold said abutment in its normal position and mechanism for displacing the abutment simultaneously with the advancement of the plate, for the purpose specified.

9. In a machine for making capsules, the combination with a rotatable spindle, a bearing-plate surrounding said spindle, stretching-rolls pivotally mounted on said plate, means for advancing and means for automatically returning the latter, of a disk rotatably mounted on the plate operatively connected with said rolls, means to normally hold the rolls in an inoperative position, an abutment on the disk, a movable element, and mechanism to cause said element to displace the abutment simultaneously with the advance of the plate, for the purpose specified.

10. In a machine for making capsules, the combination with a rotatable spindle, a bearing-plate surrounding said spindle, stretching-rolls pivotally mounted on the plate and means for advancing the latter, of a disk rotatably mounted on the plate operatively connected with said rolls, an abutment on the disk, a lever, mechanism to move the latter into contact with said abutment on the advance of the plate, and mechanism for holding the lever stationary during said advancement.

11. In a machine for making capsules, the combination with a rotatable spindle, a bearing-plate movable parallel to the longitudinal axis of said spindle, stretching-rolls pivotally mounted on the plate and surrounding said spindle, means for advancing the plate and means for automatically returning the same, of a disk rotatably mounted on the plate and operatively connected with said rolls, an abutment on the disk, a lever, mechanism to cause the latter to displace said abutment simultaneously with the advancement of the plate, means for holding the lever stationary during said advancement, means to hold the abutment in contact with the lever, and mechanism for returning the lever and plate simultaneously to their normal positions.

12. In a machine for making capsules, the combination with a conical-ended rotatable spindle, a bearing-plate movable parallel to the longitudinal axis of said spindle, stretching-rolls pivotally mounted on the plate and surrounding said spindle, means for advancing the plate along the conical part of the spindle and means for automatically returning the same, of a disk rotatably mounted on the plate and operatively connected with said rolls, an abutment on the disk inclined toward said axis of the spindle, a lever, mechanism to cause the latter to displace the abutment upon the advancement of the plate, means for holding said lever stationary during said advancement, and means for holding the abutment against said lever during advancement.

13. In a machine for making capsules, the combination with a conical-ended rotatable spindle, a non-revoluble bearing-plate movable parallel to the longitudinal axis of the spindle, a cam having a surface adapted to advance the plate the length of said conical end, a step in said cam to permit the sudden return of the plate, stretching-rolls pivotally mounted on the plate and surrounding the spindle, of a disk rotatably mounted on the plate and operatively connected with said rolls, an abutment on the plate, an abutment on the disk inclined toward said axis of the spindle, a spring connecting said abutments, a lever, a cam formed to move the latter into contact with the inclined abutment and to hold said lever stationary during the advancement of the plate and having a step to permit the lever to return simultaneously with the return of the plate.

14. In a machine for making capsules, a stretching mechanism comprising a slotted bearing-plate, a slotted disk rotatably mounted thereon, levers pivoted to the plate, a pin on one arm of each lever projecting through the slots in the plate and disk, and a roller secured to the free end of each lever, for the purpose specified.

15. In a machine for making capsules, a stretching mechanism comprising a bearing-plate provided with eccentric slots, a disk rotatably mounted on said plate provided with inclined slots crossing the aforesaid slots, levers pivotally mounted on the plate, a pin on one arm of each lever projecting through a slot in the plate and disk, and a roller secured to the free end of each lever.

16. In a machine for making capsules, a stretching mechanism comprising a bearing-plate having a central aperture and a plurality of eccentric slots, a disk rotatably mounted on said plate having a central aperture registering with the aforesaid aperture, and a plurality of inclined slots crossing the aforesaid slots, levers pivotally mounted on the plate, a pin one on arm of each lever projecting through a slot in the plate and in the disk, a roller mounted on the free arm of each lever, and a spring connecting the plate and disk.

813,605. METHOD OF FORMING MOLDS FOR CASTING PURPOSES. JOSEPH G. WEYER, Providence, R. I. Filed June 26, 1905. Serial No. 267,321.

Claim.—1. The method of making molds for casting purposes, consisting in mixing plaster-of-paris with water and finely-sifted coal-ashes with water, and then mixing these two substances together, forming said mixture into a mold around a suitable pattern, and finally subjecting the same to a moderate uniform heat for a period not exceeding five hours and then permitting the mold to cool.

2. The method of making molds for casting purposes, consisting in mixing equal quantities of plaster-of-paris and finely-sifted coal-ashes, said ingredients having been previously mixed with water, pouring said mixture around a pattern to form portions of the mold, which portions are allowed to set and dry without heat, removing said pattern when the mold is completed, and finally subjecting the substantially dry mold to a moderate uniform heat for a period not exceeding five hours and then permitting the mold to cool.

813,606. AIR-VALVE. THOMAS WERATLEY, Syracuse, N. Y. Filed Aug. 13, 1904. Serial No. 220,669.

Claim.—1. An air-valve for radiators comprising a shell having an inlet above the bottom forming a well, and an air-vent above the inlet, said well being divided into two chambers communicating with each other near the bottom of the well, one of the chambers being open at the top forming a float-chamber, and the other closed at the top forming an air-chamber, a float situated in the float-chamber, said float comprising a well open near its top, and an air-chamber closed at its top and communicating with the float-well near the bottom thereof, the inlet and air-vent being in free communication with the float-chamber.

2. In an air-valve for radiators, a shell comprising a well and an air-chamber communicating with each other near the bottom of the well, the air-chamber being closed at the top, said shell having an inlet and an air-vent, both in free communication with the upper end of the well above the closed top of the air-chamber, a float in the well, and a valve actuated by the float to close the air-vent.

3. In an air-valve for radiators, a shell having an inlet above its bottom communicating with the atmosphere, a float comprising a well closed at the bottom and opening near its top and an air-chamber closed at the top and communicating at its bottom with the float-well, and a valve actuated by the float to cut off communication between the inlet and atmosphere, said float-well having free communication with the inlet and with the atmosphere.

4. An air-valve for radiators comprising a shell having an inlet and an air-vent, a float in the shell having a closed bottom and an opening above the bottom whereby a well is formed to receive water of condensation, said float also having an air-chamber closed at the top and opening near its bottom into said well whereby air is trapped in said chamber by the accumulation of water in the float-well, and a valve for the air-vent actuated by the float.

5. In an air-valve for radiators, in combination, a shell having an inlet and an air-vent, a float comprising outer and inner hollow parts, one part being closed at the bottom and having an opening above the bottom whereby a well is formed, and the other part having its lower end open and dipping in the well and its upper end closed forming an air-chamber in which the air is trapped by the water in the float-well, and a valve actuated by the float to close the air-vent.

6. In an air-valve for radiators, a float comprising a well closed at its lower end and an air-chamber opening at or near its lower end into the well and closed at the top, said float having an opening in one side above the bottom to determine the depth of the well.

7. In an air-valve for radiators, a shell having an inlet above its bottom communicating with atmosphere, and forming a well, in combination with a float closed at the bottom and having an inlet above the bottom forming a well below the inlet, said float having an air-chamber opening at the bottom into the well and closed at the top, and a valve actuated by the rise of the float to cut off communication between the inlet and atmosphere.

8. In an air-valve for radiators, a shell having an inlet and a vent above the inlet, in combination with a baffle-tube surrounding the vent and extending partially across the inlet and having its lower end open to receive the escaping air, a valve for the air-vent, and a float in the open end of the baffle-tube and operable by varying temperatures and adapted to open and close said valve.

9. In an air-valve for radiators, a shell having an inlet above its bottom forming a well, and an air-vent above the inlet, said well communicating with the inlet, a baffle-tube surrounding the vent and extending partially across the inlet but having its lower end communicating with said inlet, a float in the well and baffle-tube, and a valve actuated by the float to close the vent.

10. In an air-valve for radiators, a shell having an inlet above its bottom forming a well and an air-vent above the inlet, a fixed valve between the inlet and vent, a flexible diaphragm between the fixed valve and atmosphere and provided with an air-passage having its lower end seated on the valve, said diaphragm being operable by varying pressures to seat the passage upon and to unseat it from the valve.

11. In an air-valve for radiators, a shell having an inlet above its bottom forming a well and a diaphragm above the inlet, said diaphragm having an air-passage communicating with the inlet and with the atmosphere, the interior of the shell being divided into two chambers communicating with each other near the bottom of the well, one of said chambers being open at the top forming a float-chamber and the other closed at the top forming an air-chamber, a float situated in the float-chamber and a valve actuated by the float for controlling communication between the inlet and atmosphere through the passage in the diaphragm.

12. In an air-valve for radiators, a shell comprising a well and an air-chamber, the well being open at the top and the air-chamber closed at the top and communicating near its bottom with the well, said shell having an inlet above the well and an air-vent above the inlet, a diaphragm between the inlet and atmosphere and provided with an air-passage, a fixed valve between the inlet and diaphragm and coacting with said passage to close communication between the inlet and atmosphere, a float in the well, and a valve actuated by the float to control communication between the inlet and passage in the diaphragm.

13. An air-valve for radiators comprising a shell having an inlet in one side, forming a well below and communicating with the inlet, said shell having an air-chamber closed at the top and its lower end opening into the well, a flexible diaphragm in the top of the shell having a passage therethrough communicating with the inlet and atmosphere, a valve for said passage, a float in the well, and itself having a well in its base communicating with the first-named well and with the inlet, said float having an air-chamber closed at its top and its lower end opening into the well in the float, and means brought into operation by the float to close communication between the inlet and passage in the diaphragm.

14. In combination with a radiator, a shell having an inlet therein, of a cap for the shell having an air-passage in its bottom, a diaphragm within the cap and also having an air-passage therethrough, a heat-actuated valve for the passage in the bottom of the cap, and a fixed valve for the passage in the diaphragm, said diaphragm being actuated by varying pressures to seat and unseat the fixed valve, and a float in the shell for operating the first-named valve.

15. In an air-valve for radiators, a shell having an inlet, a cap removably secured to the shell and provided with a valved passage, and a diaphragm in the cap having a valved passage the valve of the latter passage being fixed in the cap.

16. In an air-valve for radiators, a float having an inlet above its bottom forming a well in the base of the float in combination with an inclosing shell having an inlet above the float-inlet.

17. A float having an inlet above its bottom forming a well in the base of the float, said float including an air-chamber closed at the top and communicating with the well near its bottom whereby the air is trapped in said chamber by the water in the well.

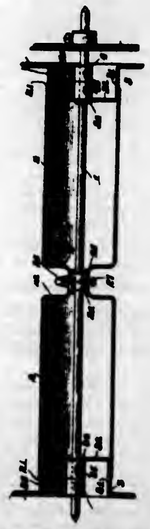
18. A float comprising outer and inner tubes, the outer tube having an inlet above its bottom to form a well and the inner tube engaged with the outer tube above the inlet and having its lower end dipping in the well, the chamber above the well being closed at the top.

19. In an air-valve for radiators, a shell having a removable bottom and an inlet above the bottom, a packing between the bottom and adjacent end of the shell and having a raised center, and a float in the shell guided on said center of the packing.

20. In an air-valve for radiators, a float comprising a well and an air-chamber communicating with each other near the bottom of the well, the air-chamber being closed at the top and the well having an inlet above its bottom.

21. In an air-valve for radiators, a shell having a removable cap, said cap having an air-passage through its bottom and a diaphragm above the bottom forming a chamber between said diaphragm and the bottom of the cap, said diaphragm having an air-passage therethrough, and a valve for the passage of the diaphragm.

813,607. TAKE-UP ROLL FOR PERFORATED MUSIC-SHEETS. FREDERICK L. WOOD, Worcester, Mass., assignor to Aeolian Company, New York, N. Y., a Corporation of Connecticut. Filed June 17, 1905. Serial No. 265,609.



Claim.—1. A roll for music-sheets comprising a central shaft, a tubular core, the interior diameter of which is considerably greater than the diameter of said shaft so as to be spaced away therefrom, and a head at each end of said core, said core and each of said heads being mounted on said shaft for longitudinal adjustment independently of each other.

2. A roll for music-sheets comprising a central shaft, a tubular core, the interior diameter of which is considerably greater than the diameter of said shaft so as to be spaced away therefrom, a head at each end of said core, said core and each of said heads being mounted on said shaft for longitudinal adjustment independently of each other, and independent means for securing each of said last-named parts on said shaft.

3. A music-roll comprising a central shaft, a tubular core, the interior diameter of which is considerably greater than the diameter of said shaft, said core being longitudinally adjustable on said shaft, and a hollow head on said shaft, said core and said head being constructed and fitted to pass one within the other.

4. A roll for music-sheets comprising a central shaft, and a tubular core the interior diameter of which is considerably greater than the diameter of said shaft, said core being concentric with and longitudinally adjustable on said shaft, said tubular core having a reduced portion intermediate of its ends and a set-screw for engaging said shaft.

5. A roll for music-sheets comprising a central shaft, a tubular core longitudinally adjustable on said shaft, and tubular flanged heads of sheet material on said shaft entering the outer ends of said core.

6. A roll for music-sheets comprising a central shaft, a tubular core longitudinally adjustable on said shaft formed of two tubular shells having their inner ends inturned to form annular flanges, a collar to which said inner ends are secured, and means for detachably securing said collar on said shaft, and flanged heads at the outer ends of said shells.

7. A roll for music-sheets comprising a central shaft, a tubular core formed of two tubular shells having inner ends of reduced diameter, a collar to which said inner ends are secured and means for adjustably securing said collar on said shaft, and flanged heads on said shaft and entering the outer ends of said shells, said heads being longitudinally adjustable on said shaft independently of said core.

8. A roll for music-sheets comprising a central shaft, a tubular core on said shaft, a flanged head on said shaft and entering the end of said core and having frictional engagement with at least one of said parts, and means adjustably secured on said shaft for limiting the outward longitudinal movement of said head.

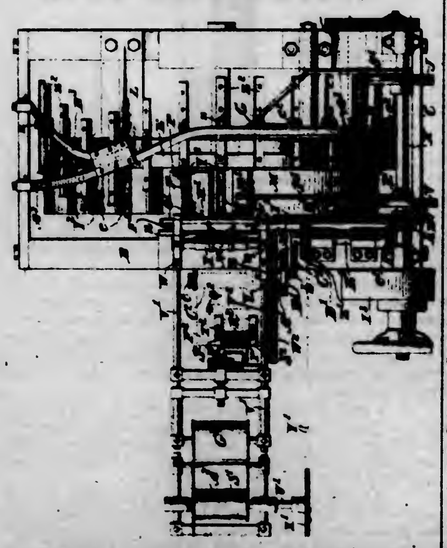
9. A roll for music-sheets having a central tubular portion of thin sheet material, heads of like material, each having a flange and a tubular sleeve which is adjustable within the ends of said central tubular portion, and a shaft upon which said central tubular portion is secured separately from said heads.

10. In a roll for music-sheets, a central shaft, a collar adjustably secured to said shaft, a hollow shell and roll section rigidly secured to said collar and adjustable therewith and hollow flanged sleeves at each end of said shell and adjustable on said shaft.

11. In a roll for music-sheets having a central shaft, a tubular shell of sheet material having a reduced portion for connection with the shaft and an enlarged portion extending from said reduced portion, means for centering and securing said reduced portion on the shaft and flanged heads at the ends of said tubular shell.

12. In a roll for music-sheets having a central shaft, a tubular shell of sheet material having a reduced portion for connection with the shaft and an enlarged portion extending from said reduced portion, means for centering and securing said reduced portion on the shaft, said securing means being adjustable to adjust said shell longitudinally and flanged heads at the ends of said tubular shell.

813,608. BOX-MACHINE. JACOB P. WRIGHT, New Haven, Conn., assignor to The Diamond Match Company, Chicago, Ill., a Corporation of Illinois. Filed June 20, 1902. Serial No. 112,070.



Claim.—1. In a box-machine, the combination of a movable part, having a series of cavities, a series of formers movable into and out of such cavities, a movable device mounted exteriorly of and adjacent to said movable part and adapted to be successively engaged by the formers, and means for periodically actuating said device to effect the movement thereby of said formers into the cavities, substantially as and for the purpose described.

2. In a box-machine, the combination of a movable part, having a series of cavities, a series of formers mounted upon and traveling with such part, and movable into and out of such cavities and a lever for moving said formers into the cavities, substantially as and for the purpose described.

3. In a box-machine, the combination of a rotary part, having a series of cavities, a series of formers movable into and out of such cavities, a movable device mounted exteriorly of and adjacent to said movable part and adapted to be successively engaged by the formers, and means for periodically actuating said device to effect the movement thereby of said formers into the cavities, substantially as and for the purpose described.

4. In a box-machine, the combination of a rotary part having a series of radially-extending cavities that open to the peripheries of the part, a series of formers movable into and out of the cavities, and a single lever for the series of formers for moving the same into the cavities.

5. In a box-machine, the combination of a movable part having a series of cavities, a series of formers movable into and out of such cavities, moving means to act on the formers to move them into the cavities, and a cam to act on the formers to move them out of the cavities, substantially as and for the purpose described.

6. In a box-machine adapted to operate on blanks having flaps to form two side folds and flaps to form but two end folds, the combination of a former, a traveling part having a cavity into and out of which the former is movable, means for moving the former into the cavity to fold the blank with all of said flaps projecting, means for folding one of each of the two flaps, and a stationary lap-folder for folding the remaining flaps beneath which said traveling part carries the partially-folded blank.

7. In a box-machine, the combination of means to form blanks, having two flaps to form side folds and but two flaps to form end folds, a former, a traveling part having a cavity into and out of which the former is movable, means for moving the former into the cavity to fold the blank with all of said flaps projecting, means for folding one of each of the two flaps, and a stationary lap-folder for folding the remaining flaps beneath which said traveling part carries the partially-folded blank.

8. In a box-machine adapted to operate on blanks having flaps to form two side folds and flaps to form but two end folds, the combination of a traveling part having a series of cavities, a series of formers movable into and out of such cavities, means for moving a former into its cavities to form three sides of the box, means for folding one of each of the two flaps, and a stationary lap-folder for folding the remaining two flaps.

9. In a box-machine, the combination of a wheel having a series of peripheral cavities, a series of formers movable into and out of such cavities, a fixed lap-folder comprising two plates, one extending adjacent to the circumference of the wheel, and the other adjacent the side thereof, and a movable lap-folder having parts corresponding to said plates, substantially as and for the purpose described.

10. In a box-machine, the combination of a wheel having a series of peripheral cavities, a series of formers mounted on the wheel and movable in radial lines into and out of said cavities, a lap-folder carried by an arm that is pivoted concentric with the wheel-axis, and a fixed folder-plate concentric with the wheel, substantially as and for the purpose described.

11. In a box-machine, the combination of a wheel having a series of peripheral cavities, a series of formers consisting of bars that extend parallel with the wheel-axis, slide-bars to which the formers are attached, mounted in guides on the wheel, and a lever for moving the slide-bars to carry the formers into their cavities, to which the slide-bars are moved in succession.

12. In a box-machine, the combination of a wheel having a series of peripheral cavities, a series of formers consisting of bars that extend parallel with the wheel-axis, slide-bars to which the formers are attached, mounted in guides on the wheel, a lever for moving the slide-bars in one direction, and a cam for moving them in the opposite direction, substantially as and for the purpose described.

13. In a box-machine, the combination of a wheel having a series of peripheral cavities, a series of formers consisting of bars that extend parallel with the wheel-axis, slide-bars to which the formers are attached, mounted in guides on the wheel, a lever for moving the slide-bars to carry the formers into their cavities, a cam for moving them in the opposite direction, and a curved plate concentric with and adjacent to the wheel-periphery, substantially as and for the purpose described.

14. In a box-machine, the combination of a wheel having a series of peripheral cavities, a series of formers consisting of bars that extend parallel with the wheel-axis, slide-bars to which the formers are attached, mounted in guides on the wheel, a lever for moving the slide-bars to carry the formers into their cavities, a cam for moving them outward, a lap-folder consisting of a curved plate concentric with and adjacent to the wheel-periphery, and a lap-folder consisting of a swinging plate, substantially as and for the purpose described.

15. In a box-machine, the combination of a wheel having a series of peripheral cavities, a series of formers consisting of bars that extend parallel with the wheel-axis, slide-bars to which the formers are attached, mounted in guides on the wheel, a lever for moving the slide-bars to carry the formers into their cavities, a cam for moving them outward, and lap-folders consisting, respectively, of movable and fixed plates, substantially as and for the purpose described.

16. In a box-machine, the combination of a wheel having a series of peripheral cavities, a series of formers consisting of bars, moving means for moving the bars into the cavities, means for moving said bars out of the cavities, lap-folders consisting respectively, of movable and fixed plates, and means for removing the boxes from the formers, substantially as and for the purpose described.

17. In a box-machine, the combination of a wheel having a series of peripheral cavities, a series of formers consisting of bars, means for moving the bars into and out of the cavities, lap-folders, and box-removing means comprising sliding rods guides for the rods on the wheel, box-engaging plates carried by the rods, and means for sliding the rods, substantially as and for the purpose described.

18. In a box-machine, the combination of box-forming devices comprising a series of cavities and corresponding bars that are movable into and out of the cavities, means for continuously moving the same, means for feeding stock to said box-forming devices, means for cutting a box-blank from the stock and means for so operating the cutting means with reference to the travel of the box-forming devices as to free the blank for the action of a forming device when it is in position to act on the blank, whereby movement of the cutting means along with the box-forming devices is avoided, substantially as and for the purpose described.

19. In a box-machine, the combination of box-forming devices, comprising a wheel having a series of cavities and corresponding bars movable into and out of the cavities, means for continuously revolving the wheel, means for feeding stock to the box-forming devices, means for cutting a box-blank from the stock, and means for so operating the cutting means with reference to the travel of the wheel as to free the blank for the action of a forming device when it reaches the blank, whereby movement of the cutting means along with the wheel is avoided, substantially as and for the purpose described.

20. In a box-machine, the combination of strip-feeding rolls, means for intermittently rotating them a knife mounted on a stationary support, box-forming devices comprising a wheel having a series of cavities and corresponding bars that are movable into and out of the cavities, and means for continuously revolving the wheel, substantially as and for the purpose described.

21. In a box-machine, the combination of a box-forming device comprising a traveling part having a cavity and a bar movable into and out of the cavity, and stationary and movable lap-folders, having surfaces on which the box-blank is supported preliminary to the action of the box-forming device, substantially as and for the purpose described.

22. In a box-machine, the combination of a wheel having a series of cavities, corresponding bars, movable into and out of the cavities, a stationary lap-folder overlying the wheel-circumference, and a movable lap-folder overlying the wheel-circumference, each of said lap-folders having a blank-supporting portion, substantially as and for the purpose described.

23. In a box-machine, the combination of strip-feeding rolls, means for intermittently rotating them, a wheel having a series of cavities and corresponding bars that are movable into and out of the cavities, movable and fixed lap-folding plates, having portions upon which the portion of strip to form a blank is supported, and a knife for cutting such strip, substantially as and for the purpose described.

24. In a box-machine, the combination of folding mechanism, a blank-support, and a blank-holder comprising a presser-bar yieldingly connected with a blank-engaging part of the holder, substantially as and for the purpose described.

25. In a box-machine, the combination of folding mechanism, a blank-support, and a blank-holder comprising a lever, a bar thereon having a blank-engaging finger, and a connection between said bar and lever that permits buckling of the lever without displacing said finger, substantially as and for the purpose described.

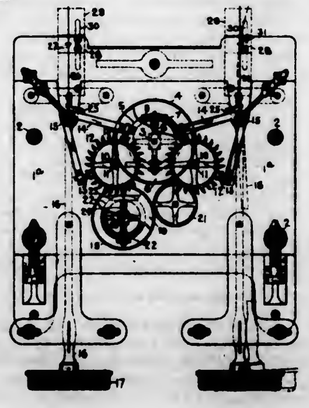
26. In a box-machine, the combination of folding mechanism, a blank-support, and a blank-holder comprising a lever having a blank-engaging finger carried by a bar that has a loose connection with the finger.

27. In a box-machine, the combination of blank-folding means a glue-wheel, and a support for box-stock opposite the glue-wheel, the stock-engaging surfaces of the support being of less area than the area of the glue-applying surfaces, substantially as and for the purpose described.

813,609. LIFE-SAVING APPLIANCE. FREDERICK W. EMSLIE, Nicola Lake, Canada. Filed Feb. 20, 1905. Serial No. 246,589.

Claim.—The herein-described safety appliance comprising a suitable casing; a reel operatively mounted therein; a cable normally wound upon said reel; a gear keyed upon the shaft carrying said reel; a controlling-gear mounted on a worm-shaft and meshing with said gear on said reel; the worm-shaft, a second shaft, a gear upon said second shaft and coöperating with said worm to control the movement of the first-mentioned gears, and a controlling-lever coöperating with said worm-shaft whereby the speed of rotation thereof may be placed under the control of the operator.

813,610. CLOCKWORK ELECTRICITY-METER. HERMANN ARON, Charlottenburg, Germany. Filed Jan. 13, 1904. Serial No. 188,880.



Claim.—1. In an electric meter, the combination with a clock-work mechanism comprising an escapement device and a pendulum

Claim.—In a mold-charging apparatus the combination with a hopper for sand having tracks upon two of its opposite lower edges,

Claim.—1. In an electric meter, the combination with a clockwork mechanism comprising an escapement device and a pendulum mounted upon a fixed fulcrum-bearing and free to vibrate freely thereon as a center in governing the action of said clockwork mechanism, of means additional to said fixed fulcrum-bearing and acting upon said pendulum substantially throughout its entire range of movement from neutral position with an intensity proportionate to its degree of deflection from and to restore it to said neutral position.

2. In an electric meter, the combination with a clockwork mechanism comprising an escapement device and a pendulum mounted upon a fixed fulcrum-bearing and free to vibrate freely thereon as a center in governing the action of said clockwork mechanism, of a spring secured to and carried by said pendulum adjacent its fulcrum-point and acting upon the same with an intensity proportionate to its degree of deflection from and to restore it to neutral position.

3. In an electric meter, the combination with a clockwork mechanism comprising an escapement device and a pendulum mounted upon a fixed fulcrum-bearing and free to vibrate freely thereon as a center in governing the action of said clockwork mechanism, of a spring secured to and carried by said pendulum adjacent its fulcrum-point, and means adjustable toward and from the fulcrum-point of said pendulum and adapted to engage said spring at a point removed from said fulcrum-point to confine it against bodily movement with said pendulum.

4. In an electric meter, the combination with the frame and a clockwork mechanism comprising an escapement device and a pendulum for controlling the operation of the same, of a flat spring rigidly connected with said pendulum, a guide embracing said spring a block by which said guide is carried, mounted upon said frame adjustably toward and from the axis of suspension of said pendulum.

5. In an electric meter, the combination with the frame and a clockwork mechanism comprising an escapement device and a pendulum for controlling the operation of the same, of a flat spring rigidly connected with said pendulum, a supporting-standard carried by said frame, a sliding block secured upon said standard by a pin-and-slot connection adjustably toward and from the axis of suspension of said pendulum, and a pair of spaced guide-pins carried by said sliding block and embracing the said spring.

6. In an electric meter, the combination with a clockwork mechanism comprising two connected escapement devices and two pendula therefor, each of which controls the operation of its respective escapement device, of a flat spring rigidly connected with each of said pendula and guides adjustable toward and from the axes of suspension of their respective pendula through which said springs are extended.

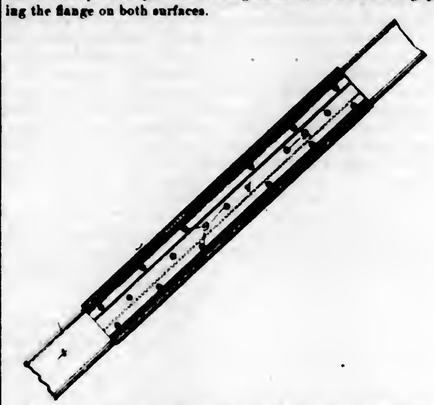
813,611. METALLIC RAILWAY-TIE. ALBON W. BABCOM, Spokane, Wash. Filed Nov. 27, 1905. Serial No. 289,283.

Claim.—1. A railway-tie comprising a rectangular body formed by bending the sides and ends of a sheet of metal downwardly to form a surrounding flange, a lumber cushion in said body of less thickness than its surrounding flange, metal plates upon the under side of said cushion adjacent to its ends, rail-clamping plates upon the upper face of said tie, and fastening devices passed through alining openings in said metal plates, said cushion, said tie and said clamping-plates, substantially as described.

2. A railway-tie comprising a rectangular body formed by bending the sides and ends of a sheet of metal downwardly to form a surrounding flange, a lumber cushion in said body of less thickness than its surrounding flange, metal plates upon the under side of said cushion adjacent to its ends, said plates being formed with polygonal-shaped openings, rail-clamping plates upon the top of said tie, and bolts passed through openings in said plates and alining openings in said cushion, tie and clamping-plates, said bolts having polygonal-shaped shoulders adjacent to their heads adapted to engage the similarly-shaped openings in said metal plates, substantially as described.

813,612. REINFORCED BRAKE-BEAM. CARL B. BAUER, Hammond, Ind., assignor to Simplex Railway Appliance Company, Chicago, Ill., a Corporation of Illinois. Filed June 1, 1905. Serial No. 263,336.

Claim.—1. A flanged beam, having a reinforcing sheath of metal extending for a portion of its length and adapted to stiffen the beam at the point of greatest bending moment, such sheath engaging the flange on both surfaces.



2. A brake beam having plate metal sheaths closely fitting and surrounding the flanges of the beam, and riveted to the web, said sheaths extending over the central portion of the beam.

3. The combination with an I-beam, of a reinforcing sheath enveloping each flange and having each a narrow and a wide wing, the respective wide wings projecting over each other and both riveted to the web of the beam.

4. In a brake beam a reinforcement comprising a rolled plate metal sheath extending over the central part of the beam and enveloping the flange and riveted to the web, substantially as described.

5. A brake beam having plate metal sheaths closely fitting and surrounding the flanges and web of the beam, said sheaths extending over a portion of the length of the beam.

813,613. PUMP-ROD COUPLING. JOHN R. BOALS, River Falls Wis. Filed May 3, 1905. Serial No. 258,513.

Claim.—1. A pump-rod coupling comprising a pitman having one open side, an apron pivoted in the open side and provided on its inner side with a pin normally projecting across the pitman and into the side of the pitman opposite the apron, a spring-clasp secured on the pitman and adapted to take over the edge of the apron and hold it parallel with the pitman.

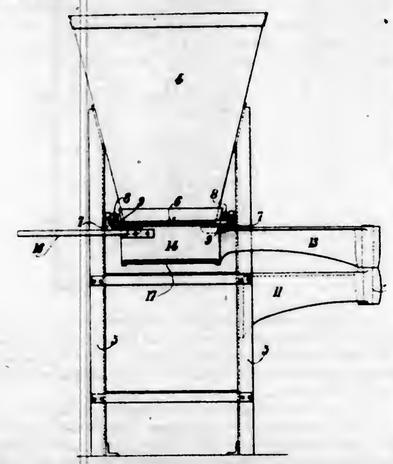
2. A pump-rod coupling comprising a pitman having one open or grooved side, an apron pivoted in the open side and provided on its inner side with a pin normally projecting across the groove and into the side of the pitman opposite the apron, a spring-clasp secured on the pitman and adapted to take over the edge of the apron and hold it parallel with the pitman, and a spring-arm arranged to throw the apron outward when disengaged from the clasp.

3. A pump-rod coupling comprising a pitman having one open or grooved side, an apron pivoted in the open side and provided on its inner side with a pin normally projecting across the groove and into the side of the pitman opposite the apron, a spring-clasp secured on the pitman and adapted to take over the edge of the apron and hold it parallel with the pitman, and a spring-arm arranged to throw the apron outward when disengaged from the clasp, said clasp having an inclined operating-arm adapted to be operated by the finger in opening the apron and by the edge of the apron in closing the apron, substantially as and for the purpose set forth.

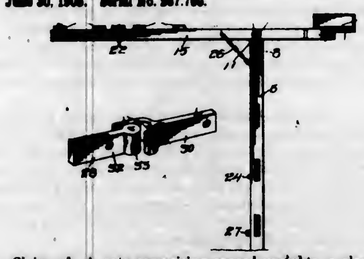
4. The combination with the pumping-rods of a windmill and a pump, of a coupling comprising a grooved member secured on one of the rods and guidingly embracing the other rod, there being a transverse hole in said other rod, said grooved member having in its groove a pivoted flap, latch or apron, a pin in said apron for engaging the hole in the rod, a spring-clasp holding the apron closed, and a spring-arm throwing the apron open when released from the clasp.

813,614. MOLD-CHARGING APPARATUS. PHILIBERT BONVILLAIN, Paris, France. Filed Apr. 24, 1905. Serial No. 257,055.

Claim.—In a mold-charging apparatus the combination with a hopper for sand having tracks upon two of its opposite lower edges, of a movable bottom under the said hopper, rollers applied upon the bottom and turning upon the said tracks, flanges fixed under the said movable bottom, a box mounted upon a fixed axis for turning under the said hopper, a stop fixed upon one of the sides of this box for engaging between the flanges on the said movable bottom of the hopper, a bottom movable in ways on the said box, and parallel flanges fixed under the last-named movable bottom for engaging with a stop arranged under the molding-machine which is being charged by the apparatus, substantially as described and for the purpose specified.



813,615. GATE. WALTER C. BOYD, Williamsburg, Iowa. Filed June 30, 1905. Serial No. 267,769.

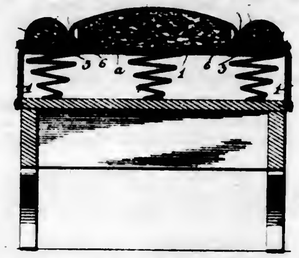


Claim.—1. A gate comprising spaced uprights, a closure for the space between the uprights, said closure being connected with one of the uprights for horizontal pivotal movement into and out of operative position, the connection of said closure with said upright being also arranged to permit of vertical pivotal movement of the closure into and out of operative position, said closure being also detachably connected with the other upright for vertical pivotal movement with respect thereto, a stop member carried by the first-named upright and a member carried by the closure and adapted for engagement of the stop member to limit the vertical pivotal movement of the closure in one direction, said stop member having a recess therein adapted for the reception of the second-named member at times for pivotal movement of the second-named member with respect thereto when the gate is moved horizontally.

2. A gate comprising spaced uprights, a horizontal shaft pivoted at one end to one of the uprights for horizontal movement and detachably connected with the other upright, a closure for the space between the uprights pivoted upon the shaft for vertical movement into and out of operative position, latch members carried by the closure and adapted to engage the uprights to limit the movement of the closure in one direction and an auxiliary stop comprising two members, one carried by the closure and the other by the upright to which the shaft is pivotally connected, the second-named member having a recess adapted for the reception of the other member for pivotal movement of said member therewithin, the closure-carried member lying against the other member when the closure is in operative position, the detachable connection of the shaft with one of the uprights being arranged for movement into at times inoperative position.

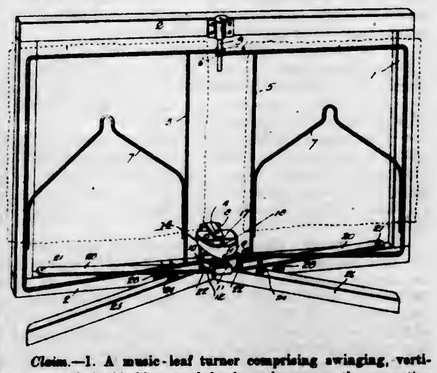
3. A gate comprising spaced uprights, a horizontal shaft connected with the uprights, a closure pivoted upon the shaft for movement into and out of position to close the space between the uprights, said closure comprising side members having openings in which the shaft is revolubly engaged, horizontal slats secured to the lower portions of the side members, an upwardly-curved top piece secured at its ends to the upright ends of the side members, a brace secured to the slats and to the top piece, a weight secured to the top piece and to the brace of sufficient heaviness to balance the portion of the closure lying below the shaft, chains secured to the uprights and to the lower portion of the closure, said chains being arranged to limit the upward movement of said lower portion of the closure and latches arranged to limit the opposite movement of the closure and to hold it against movement, said latches being arranged for movement into and out of operative position.

813,616. PAD FOR UPHOLSTERED FURNITURE. FRANCIS D. BOYLE, Toledo, Ohio. Filed Jan. 23, 1905. Serial No. 242,242.



Claim.—A pad for roll-edge upholstered furniture, comprising a lining or under cover, a center piece, having its edges stitched to said lining or under cover, a welt-piece and a roll-edge piece having their edges stitched together and secured to the under cover by stitching, the stitching which secures said center piece, welt-piece, roll-edge piece and lining together, being independent of and unaffected by the devices employed to secure the pad to the furniture.

813,617. MUSIC-LEAF TURNER. WALTER L. CATWOOD and ERNEST M. STEBLE, Canon City, Colo. Filed Aug. 14, 1905. Serial No. 274,145.



Claim.—1. A music-leaf turner comprising swinging, vertically-movable leaf-holders, each having a lower arm, the respective lower arms of the leaf-holders being one above another, a lower cam device, and an upper cam device, respectively below and above the lower arms of the leaf-holders, said cam devices being mounted for simultaneous oscillatory movement in a horizontal plane and said upper cam device being also mounted for independent vertical angular movement, and means to operate said cam devices.

2. A music-leaf turner comprising swinging, vertically-movable leaf-holders, each having a lower arm, a vertical shaft mounted for

means actuated by the passage of the train in the opposite direction for throwing said first-mentioned means out of operation, said means

railways, comprising a hammer, an anvil to receive the detonators, a

deposits from the solution, and depositing the gold, silver and other

2. A music-leaf turner comprising swinging, vertically-movable leaf-holders, each having a lower arm, a vertical shaft mounted for oscillatory movement, and to which the lower arms of the leaf-holders are connected for vertical and also for independent angular movement in horizontal planes, a lower cam device and an upper cam device respectively below and above the lower arms of the leaf-holders, said cam devices being connected to and oscillated with the said shaft, and said upper cam device being also mounted for independent angular movement in a vertical plane, and means to simultaneously turn said cam devices in either direction.

3. A music-leaf turner comprising swinging, vertically-movable leaf-holders, each having a lower arm, the respective lower arms of the leaf-holders being one above another, a lower cam device and an upper cam device respectively below and above the lower arms of the leaf-holders, said cam devices being mounted for simultaneous oscillatory movement in a horizontal plane and said upper cam device being also mounted for independent vertical angular movement, levers connected to the lower cam device, hand-levers, links connecting the hand-levers to the first-mentioned levers, and springs pressing the free ends of the hand-levers outwardly, substantially as described.

813,618. COATED STRIP AND METHOD OF MAKING THE SAME. HENRY S. CHAPMAN, Glenridge, N. J., and WILBUR M. BROWN, New York, N. Y., assignors to Arlington Company, a Corporation of New Jersey. Filed July 10, 1905. Serial No. 269,120.

Claim.—1. A rigid strip having a seamless incasing coating of semiplastic material and a second coating of similar material on a portion thereof, said second portion forming a reinforcing-bead thereon.

2. A rigid strip having a seamless incasing coating of semiplastic material and a second coating of similar material on portions thereof, said second portions forming reinforcing-beads lengthwise thereon.

3. A strip having a seamless incasing coating of semiplastic material, a reinforcing-bead on each edge thereof and a reinforcing-cap on each end thereof, said beads and caps being of the same material as the coating.

4. A strip having a seamless incasing coating of semiplastic material, a reinforcing-bead on each edge thereof and a reinforcing-cap on each end thereof, said beads and caps being of the same material as the coating and integral therewith.

5. A strip having a covering of fabric, paper or other material and a seamless incasing coating of semiplastic material thereover and a reinforcing-cap on each end thereof of the same material as the coating.

6. A strip having a covering of fabric, paper or other material and a seamless impregnating and incasing coating of semiplastic material thereover and a reinforcing-cap on each end thereof of the same material and integral with the coating.

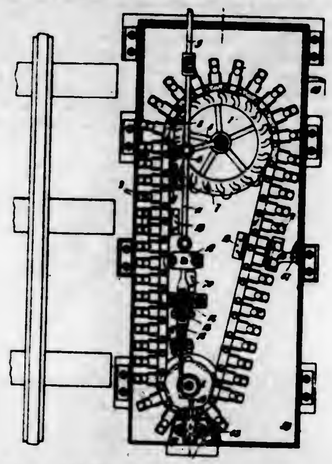
7. The process of coating strips, comprised in applying a solution of coating material to the strip, drying the solution on the strip, again applying a solution of the coating material to the strip, and scraping off the fluid coating from portions of the strip while allowing it to remain on other portions of the strip.

8. The process of coating strips, comprised in passing the strip through a solution of coating material, scraping off the surplus material, drying the solution on the strip, then passing the strip again through the coating material and scraping off the fluid coating from portions of the strip while allowing it to remain on other portions of said strip.

9. The process of coating strips comprised in passing the strip through a solution of coating material, scraping off the surplus material, drying the solution on the strip, then passing the strip again through the coating material, scraping off all of the fluid coating solution from the middle of the faces of the strip while allowing the coating solution to remain on the edges of the strip and on those portions of the faces of the strip contiguous to the edges.

813,619. ACOUSTIC SIGNALING APPARATUS FOR RAILWAYS. ERMINIO COSTA-CASELI, Naples, Italy. Filed Oct. 24, 1902. Serial No. 128,612.

Claim.—1. An automatic apparatus for acoustic signals on railways comprising a hammer, an anvil to receive the detonators, means actuated by the passage of the train for operating said hammer and means actuated by the passage of the train in the opposite direction for throwing said first-mentioned means out of operation, said means being used on a single track, substantially as described.



2. In an acoustic signal device, a hammer, an anvil, means for supplying detonators to the anvil, means for operating the hammer, said means being actuated by the passage of a train, and electric means for indicating when the parts are in a position of rest, substantially as described.

3. In an acoustic signal device, a detonating apparatus, a pedal, a cylinder, a piston therein, said piston supporting one end of the pedal, and means supported by said piston and connected to the said detonating apparatus for operating the same when the piston is pressed down by the train acting on the pedal, substantially as described.

4. An automatic apparatus for acoustic signals on railways comprising a pedal adapted to be operated by the passage of the train-wheels, an anvil, a hammer, means carrying the detonators operated by the lowering of said pedal, and an eccentric that in its position of rest holds the hammer at a level somewhat above the detonators and in operative position allows of the free falling of the hammer.

5. An automatic apparatus for acoustic signals on railways, comprising a hammer, an anvil to receive the detonators, a pedal in combination with a piston-rod, a pivot on said piston-rod, a lever supported by said pivot, a shaft on which said lever is mounted, a counterweight-lever on said shaft, mechanism carrying the detonators and a rod connecting said mechanism to the before-mentioned lever so that on the lowering of the pedal the parts will be put in operative position, substantially as described.

6. An automatic apparatus for acoustic signals on railways comprising a hammer, an anvil to receive the detonators, a pedal, connections from the pedal for operating the hammer, a piston-rod connected to said pedal, a piston, a pressure-chamber controlling the motion of the pedal, said chamber being partially filled with liquid and partially with compressed air, substantially as described.

7. An automatic apparatus for acoustic signals on railways, comprising a hammer, an anvil to receive the detonators, a pedal, connections from the pedal to the hammer for operating said hammer, a piston-rod connected to said pedal, a pressure-chamber filled with liquid and compressed air, and a valve opening upward when the piston lowers, said valve having a small hole therein allowing the liquid to pass slowly when the piston rises so that said piston acts as a hydropneumatic brake, substantially as described.

8. An automatic apparatus for acoustic signals on railways, comprising a hammer, an anvil to receive the detonators, a pedal, connections from the pedal to the hammer for operating the hammer, a piston-rod connected to one end of the pedal, a sliding block connected with the other end of the pedal, a shaft connected to the said block, a counterweight-lever on said shaft and transmission-wires from the visual signal or from the station for setting down the pedal out of the action of the trains or to set it up again in working position, substantially as described.

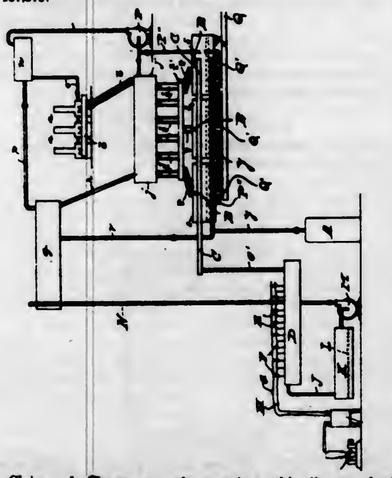
9. An automatic apparatus for acoustic signals on signal-line railways, comprising a hammer, an anvil to receive the detonators, a pedal, a piston-rod connected thereto, a sliding block also connected with the pedal, a detonator apparatus for placing the detonators on the anvil, a lever for working said apparatus, a shaft therefor, said pedal acting on the said lever, a counter-pedal placed immediately after the first pedal on the station side, a sliding block connected to said counter-lever, a piston-rod also connected to said counter-lever, an oscillating bar actuated by the piston-rods, a communicating wedge on said bar and a projecting tooth adapted to stop the shaft which bears the lever working the detonator apparatus, substantially as described.

10. In an automatic apparatus for acoustic signals on railways, a detonating apparatus acted on by the passage of the train, an anvil, an explosion-chamber above the anvil for the expansion of the gases and an oscillating plate closing at each explosion an electric circuit in order to signal the explosion at the station, substantially as described.

11. In an automatic apparatus for acoustic signals on railways, a detonating apparatus, a lever acted on by the passage of the train, a rod having a to-and-fro motion, rotary mechanism carrying the petards acted on by the movement of the said rod in one direction, an electric-alarm-operating circuit, and means for closing said circuit, said means being operated by the movement of said rod in the other direction.

12. In an apparatus for acoustic signals on railways, a detonating device, mechanism for carrying the petards to the detonating device, a contact 67, a plate tending to rest on said contact, said plate and contact being placed a short distance from the detonating device, said plate projecting over the petards and being raised above the contact by said petards so that when the exploded petards begin to pass under said plate it will be allowed to fall on the contact, a bell-operating circuit in which the said plate and contact are placed, the closing of said circuit producing a continual ringing of the bell thus announces that the petards are about to become exhausted, an interrupter, operated by the detonating device for temporarily interrupting the continual ringing of the bell.

813,620. PROCESS OF EXTRACTING GOLD, SILVER, &c. JOSEPH A. COHEN, Los Angeles, Cal. Filed Jan. 2, 1904. Serial No. 187,573.



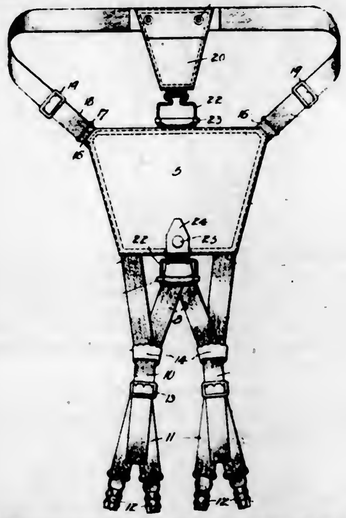
Claims.—1. The process of extracting gold, silver, and other metals from ores, consisting in subjecting the crushed ores to a solution of the cyanid of potassium, drawing off the said solution from the pulp mixed therewith, impregnating with air the said solution and sedimentary deposits suspended therein, separating the sedimentary deposits from the solution, and depositing the metals contained in the solution with electricity.

2. The process of extracting gold, silver and other metals from ores, consisting in subjecting the ores to an alkaline solution of the cyanid of potassium, drawing off the said solution from the pulp mixed therewith, impregnating with air the said solution and sedimentary deposits suspended therein, separating the sedimentary deposits from the solution, and depositing the gold, silver and other metals in the said solution by means of electricity.

3. The process of extracting gold, silver and other metals from ores, consisting in dissolving the gold, silver and other metals from the ores by means of a cyanid solution, eliminating the pulp and other foreign matters suspended in said solution, forcing compressed air through the said cyanid solution and sedimentary deposits suspended therein, separating the said sedimentary deposits from the said solution, and depositing by means of electricity the metals carried in said solution.

4. The method of extracting metals from ores consisting in treating the crushed ores with an alkaline cyanid solution, separating the said solution from the ores and other foreign substances mixed therewith, injecting compressed air into said solution, separating sedimentary substances suspended in said solution, and depositing by means of electricity the metals dissolved by the said solution.

813,621. HOSE-SUPPORTER. HENRY B. COOPER, Columbus, Ohio. Filed Nov. 18, 1904. Serial No. 233,378.



Claim.—1. In combination, a belt comprising front and back portions, metallic loops connected to the upper corners of one of said portions, side tapes threaded through said loops with means for adjusting them and having their opposite ends detachably connected to the other of said portions, a double-looped flexible member depending from the front portion, and a hose-supporting member depending from each loop and having a sliding connection therewith, substantially as described.

2. In combination, a front portion, metallic loops connected to the upper corners thereof, side tapes threaded through said loops with means for adjusting them, detachable connecting means between the other ends of said tapes, a double-looped flexible member depending from the front portion, a metallic loop carried by each loop of said double-looped member, an elastic member threaded through each of said metallic loops and having depending coextensive portions or ends, and a clip carrying hose-engaging devices adjustably connected to both said coextensive portions, substantially as described.

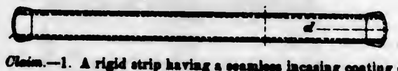
3. In combination, a belt comprising front and back portions, metallic loops connected to the upper corners of one of said portions, side tapes threaded through said loops with means for adjusting them and having their opposite ends detachably connected to the other of said portions, a double-looped member depending from the front portion, a metallic loop carried by each loop of said double-looped member, an elastic member threaded through each of said metallic loops, and having depending coextensive portions or ends, and a holding means carrying hose-supporting members adjustably connected to both said coextensive portions or ends, substantially as described.

4. In a hose-supporter having two looped members slidingly connected together, means for effecting such sliding connection com-

2. A music-leaf turner comprising swinging, vertically-movable leaf-holders, each having a lower arm, a vertical shaft mounted for oscillatory movement, and to which the lower arms of the leaf-holders are connected for vertical and also for independent angular movement in horizontal planes, a lower cam device and an upper cam device respectively below and above the lower arms of the leaf-holders, said cam devices being connected to and oscillated with the said shaft, and said upper cam device being also mounted for independent angular movement in a vertical plane, and means to simultaneously turn said cam devices in either direction.

3. A music-leaf turner comprising swinging, vertically-movable leaf-holders, each having a lower arm, the respective lower arms of the leaf-holders being one above another, a lower cam device and an upper cam device respectively below and above the lower arms of the leaf-holders, said cam devices being mounted for simultaneous oscillatory movement in a horizontal plane and said upper cam device being also mounted for independent vertical angular movement, levers connected to the lower cam device, hand-levers, links connecting the hand-levers to the first-mentioned levers, and springs pressing the free ends of the hand-levers outwardly, substantially as described.

813,618. COATED STRIP AND METHOD OF MAKING THE SAME. HENRY S. CHAPMAN, Glenridge, N. J., and WILBUR M. STORR, New York, N. Y., assignors to Arlington Company, a Corporation of New Jersey. Filed July 10, 1905. Serial No. 269,120.



Claim.—1. A rigid strip having a seamless incasing coating of semiplastic material and a second coating of similar material on a portion thereof, said second portion forming a reinforcing-bead thereon.

2. A rigid strip having a seamless incasing coating of semiplastic material and a second coating of similar material on portions thereof, said second portions forming reinforcing-beads lengthwise thereon.

3. A strip having a seamless incasing coating of semiplastic material, a reinforcing-bead on each edge thereof and a reinforcing-cap on each end thereof, said beads and caps being of the same material as the coating.

4. A strip having a seamless incasing coating of semiplastic material, a reinforcing-bead on each edge thereof and a reinforcing-cap on each end thereof, said beads and caps being of the same material as the coating and integral therewith.

5. A strip having a covering of fabric, paper or other material and a seamless incasing coating of semiplastic material thereover and a reinforcing-cap on each end thereof of the same material as the coating.

6. A strip having a covering of fabric, paper or other material and a seamless impregnating and incasing coating of semiplastic material thereover and a reinforcing-cap on each end thereof of the same material and integral with the coating.

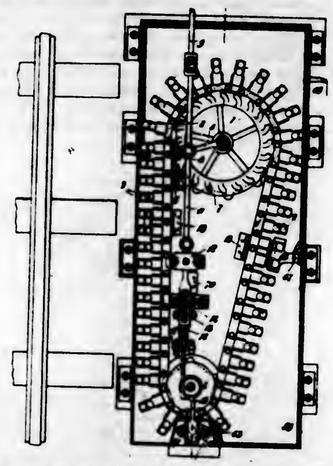
7. The process of coating strips, comprised in applying a solution of coating material to the strip, drying the solution on the strip, again applying a solution of the coating material to the strip, and scraping off the fluid coating from portions of the strip while allowing it to remain on other portions of the strip.

8. The process of coating strips, comprised in passing the strip through a solution of coating material, scraping off the surplus material, drying the solution on the strip, then passing the strip again through the coating material and scraping off the fluid coating from portions of the strip while allowing it to remain on other portions of said strip.

9. The process of coating strips comprised in passing the strip through a solution of coating material, scraping off the surplus material, drying the solution on the strip, then passing the strip again through the coating material, scraping off all of the fluid coating solution from the middle of the faces of the strip while allowing the coating solution to remain on the edges of the strip and on those portions of the faces of the strip contiguous to the edges.

813,619. ACOUSTIC SIGNALING APPARATUS FOR RAILWAYS. IGNAZIO CORSI-CASELI, Naples, Italy. Filed Oct. 24, 1902. Serial No. 128,613.

Claim.—1. An automatic apparatus for acoustic signals on railways comprising a hammer, an anvil to receive the detonators, means actuated by the passage of the train for operating said hammer and means actuated by the passage of the train in the opposite direction for throwing said first-mentioned means out of operation, said means being used on a single track, substantially as described.



2. In an acoustic signal device, a hammer, an anvil, means for supplying detonators to the anvil, means for operating the hammer, said means being actuated by the passage of a train, and electric means for indicating when the parts are in a position of rest, substantially as described.

3. In an acoustic signal device, a detonating apparatus, a pedal, a cylinder, a piston therein, said piston supporting one end of the pedal, and means supported by said piston and connected to the said detonating apparatus for operating the same when the piston is pressed down by the train acting on the pedal, substantially as described.

4. An automatic apparatus for acoustic signals on railways comprising a pedal adapted to be operated by the passage of the train-wheels, an anvil, a hammer, means carrying the detonators operated by the lowering of said pedal, and an eccentric that in its position of rest holds the hammer at a level somewhat above the detonators and in operative position allows of the free falling of the hammer.

5. An automatic apparatus for acoustic signals on railways, comprising a hammer, an anvil to receive the detonators, a pedal in combination with a piston-rod, a pivot on said piston-rod, a lever supported by said pivot, a shaft on which said lever is mounted, a counterweight-lever on said shaft, mechanism carrying the detonators and a rod connecting said mechanism to the before-mentioned lever so that on the lowering of the pedal the parts will be put in operative position, substantially as described.

6. An automatic apparatus for acoustic signals on railways comprising a hammer, an anvil to receive the detonators, a pedal, connections from the pedal for operating the hammer, a piston-rod connected to said pedal, a piston, a pressure-chamber controlling the motion of the pedal, said chamber being partially filled with liquid and partially with compressed air, substantially as described.

7. An automatic apparatus for acoustic signals on railways, comprising a hammer, an anvil to receive the detonators, a pedal, connections from the pedal to the hammer for operating said hammer, a piston-rod connected to said pedal, a pressure-chamber filled with liquid and compressed air, and a valve opening upward when the piston lowers, said valve having a small hole therein allowing the liquid to pass slowly when the piston rises so that said piston acts as a hydropneumatic brake, substantially as described.

8. An automatic apparatus for acoustic signals on railways, comprising a hammer, an anvil to receive the detonators, a pedal, connections from the pedal to the hammer for operating the hammer, a piston-rod connected to one end of the pedal, a sliding block connected with the other end of the pedal, a shaft connected to the said block, a counterweight-lever on said shaft and transmission-wires from the visual signal or from the station for setting down the pedal out of the action of the trains or to set it up again in working position, substantially as described.

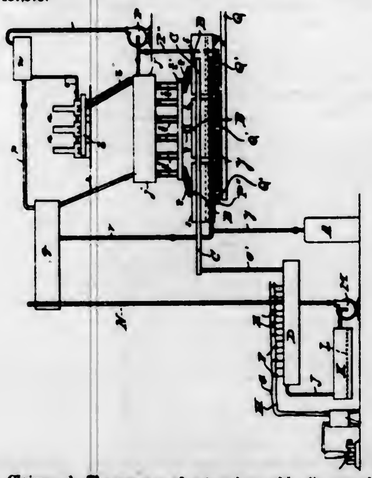
9. An automatic apparatus for acoustic signals on signal-line railways, comprising a hammer, an anvil to receive the detonators, a pedal, a piston-rod connected thereto, a sliding block also connected with the pedal, a detonator apparatus for placing the detonators on the anvil, a lever for working said apparatus, a shaft therefor, said pedal acting on the said lever, a counter-pedal placed immediately after the first pedal on the station side, a sliding block connected to said counter-lever, a piston-rod also connected to said counter-lever, an oscillating bar actuated by the piston-rods, a communicating wedge on said bar and a projecting tooth adapted to stop the shaft which bears the lever working the detonator apparatus, substantially as described.

10. In an automatic apparatus for acoustic signals on railways, a detonating apparatus acted on by the passage of the train, an anvil, an explosion-chamber above the anvil for the expansion of the gases and an oscillating plate closing at each explosion an electric circuit in order to signal the explosion at the station, substantially as described.

11. In an automatic apparatus for acoustic signals on railways, a detonating apparatus, a lever acted on by the passage of the train, a rod having a to-and-fro motion, rotary mechanism carrying the petards acted on by the movement of the said rod in one direction, an electric-alarm-operating circuit, and means for closing said circuit, said means being operated by the movement of said rod in the other direction.

12. In an apparatus for acoustic signals on railways, a detonating device, mechanism for carrying the petards to the detonating device, a contact 67, a plate tending to rest on said contact, said plate and contact being placed a short distance from the detonating device, said plate projecting over the petards and being raised above the contact by said petards so that when the exploded petards begin to pass under said plate it will be allowed to fall on the contact, a bell-operating circuit in which the said plate and contact are placed, the closing of said circuit producing a continual ringing of the bell thus announces that the petards are about to become exhausted, an interrupter, operated by the detonating device for temporarily interrupting the continual ringing of the bell.

813,620. PROCESS OF EXTRACTING GOLD, SILVER, &c. JOSEPH A. COHEN, Los Angeles, Cal. Filed Jan. 2, 1904. Serial No. 187,878.



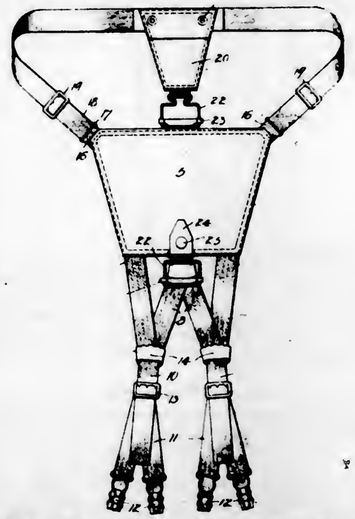
Claims.—1. The process of extracting gold, silver, and other metals from ores, consisting in subjecting the crushed ores to a solution of the cyanid of potassium, drawing off the said solution from the pulp mixed therewith, impregnating with air the said solution and sedimentary deposits suspended therein, separating the sedimentary deposits from the solution, and depositing the metals contained in the solution with electricity.

2. The process of extracting gold, silver and other metals from ores, consisting in subjecting the ores to an alkaline solution of the cyanid of potassium, drawing off the said solution from the pulp mixed therewith, impregnating with air the said solution and sedimentary deposits suspended therein, separating the sedimentary deposits from the solution, and depositing the gold, silver and other metals in the said solution by means of electricity.

3. The process of extracting gold, silver and other metals from ores, consisting in dissolving the gold, silver and other metals from the ore by means of a cyanid solution, eliminating the pulp and other foreign matters suspended in said solution, forcing compressed air through the said cyanid solution and sedimentary deposits suspended therein, separating the said sedimentary deposits from the said solution, and depositing by means of electricity the metals carried in said solution.

4. The method of extracting metals from ores consisting in treating the crushed ores with an alkaline cyanid solution, separating the said solution from the ores and other foreign substances mixed therewith, injecting compressed air into said solution, separating sedimentary substances suspended in said solution, and depositing by means of electricity the metals dissolved by the said solution.

813,621. HOSE-SUPPORTER. HENRY B. COOPER, Columbus, Ohio. Filed Nov. 18, 1904. Serial No. 233,276.



Claim.—1. In combination, a belt comprising front and back portions, metallic loops connected to the upper corners of one of said portions, side tapes threaded through said loops with means for adjusting them and having their opposite ends detachably connected to the other of said portions, a double-looped flexible member depending from the front portion, and a hose-supporting member depending from each loop and having a sliding connection therewith, substantially as described.

2. In combination, a front portion, metallic loops connected to the upper corners thereof, side tapes threaded through said loops with means for adjusting them, detachable connecting means between the other ends of said tapes, a double-looped flexible member depending from the front portion, a metallic loop carried by each loop of said double-looped member, an elastic member threaded through each of said metallic loops and having depending coextensive portions or ends, and a clip carrying hose-engaging devices adjustably connected to both said coextensive portions, substantially as described.

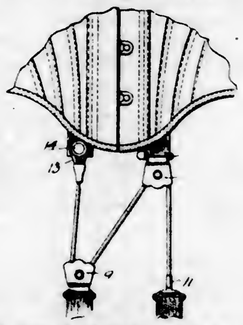
3. In combination, a belt comprising front and back portions, metallic loops connected to the upper corners of one of said portions, side tapes threaded through said loops with means for adjusting them and having their opposite ends detachably connected to the other of said portions, a double-looped member depending from the front portion, a metallic loop carried by each loop of said double-looped member, an elastic member threaded through each of said metallic loops, and having depending coextensive portions or ends, and a holding means carrying hose-supporting members adjustably connected to both said coextensive portions or ends, substantially as described.

4. In a hose-supporter having two looped members slidingly connected together, means for effecting such sliding connection com-

prising a metallic loop, around the lower bar of which one of such members passes, a sheet-metal casing extending to one side from said metal loop and having closed-in sides and a mouth opening away from said metal loop, said other looped member extending through said mouth and being slidingly held within the casing and inclosed on all sides thereby, substantially as described.

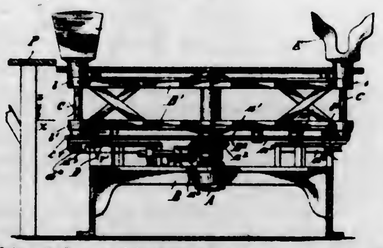
5. In a hose-supporter having two looped flexible members slidingly connected together, means for effecting such sliding connection comprising a metallic loop and a sheet-metal casing clamped around one bar of said loop and inclosing the other bar, and having parallel slots in its sides through which one of said members passes, substantially as described.

813,622. **HOSE-SUPPORTER.** HENRY B. COOPER, Columbus, Ohio. Filed July 17, 1905. Serial No. 270,123.



Claim.—In a stocking-supporter, the combination with a flexible cord and hose-attaching devices, of a slide for connecting the hose-attaching devices to the cord and comprising a metal loop, and a single piece of sheet metal doubled upon itself and embracing one of the bars of the loop, said doubled sheet metal having inwardly-turned and overlapping ends and a rivet extending between the sides around which the cord passes.

813,623. **ROUNDABOUT.** EDWIN DOWALDSON, New York, N. Y. Filed Mar. 9, 1905. Serial No. 249,326.



Claim.—1. In a roundabout, a car for passengers, a rotatory shaft supporting said car, a yielding connection between said car and said shaft, and means to intermittently rotate said car and shaft around the latter's axis.

2. In a roundabout, the combination of a stationary vertically-disposed axle, a rotatory frame sleeved on said axle, a car carried by said frame, an idler-shaft journaled in said frame, springs affixed to said car so as to bear yieldingly against the head of the idler-shaft, means to rotate said idler-shaft upon its own axis, and means to rotate said frame.

3. The combination of a stationary vertically-disposed axle, a rotatory frame sleeved on said axle, an independently-rotatable car supported by said frame, a vertically-disposed idler-shaft journaled in said frame, springs affixed to said car so as to bear yieldingly against the head of the idler-shaft, means to intermittently rotate said idler-shaft, and means to rotate said frame.

4. The combination of a vertically-disposed stationary axle, a rotatory frame sleeved on said axle, means to rotate said frame, an independently-rotatable car supported by an idler-shaft journaled in said frame and yieldingly coupled with said car, a pinion on said idler-shaft, a plurality of stationary segmental racks concentric with said axle to intermittently engage said pinion, stationary segmental guides also concentric with said axle intermediate said racks, and levers radially projecting from said idler-shaft to intermittently contact with said guides.

5. The combination of a vertically-disposed stationary axle, a rotatory frame sleeved on said axle, means to rotate said frame, a vertically-disposed idler-shaft journaled in said frame, a pinion on said idler-shaft, a plurality of stationary segmental racks concentric with said axle to intermittently engage said pinion, stationary segmental guides also concentric with said axle intermediate said racks, levers radially projecting from said idler-shaft to intermittently contact with said guides so as to prevent rotation of said idler-shaft until said pinion engages with said rack.

6. The combination of a stationary vertically-disposed axle, a rotatory frame sleeved on said axle, means to rotate said frame, an idler-shaft journaled in said frame, a pinion on said idler-shaft, a segmental rack concentric with said axle to engage said pinion, a lever radially projecting from said idler-shaft, and a guide contacting with said lever whereby operative presentation of said pinion to said rack is insured.

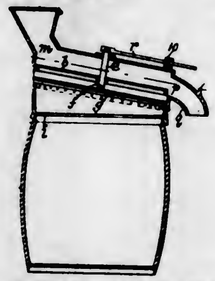
813,624. **BADGE.** JAMES A. DORAN and JAMES C. DORAN, Providence, R. I. Filed Oct. 11, 1905. Serial No. 282,235.

Claim.—1. In a badge the combination with the body provided with a depression, of a plate normally fitting in said depression, a spring-arm upon the plate, means for pivoting the arm to the body so as to swing in a plane parallel to the body, and a legend-strip in the depression intermediate the body and plate.

2. In a badge the combination with the body provided with an opening, of a marginal seat around the opening, a plate normally fitting in the seat, an arm upon the plate, means for pivoting the arm to the body so as to swing in a plane parallel to the body, and a legend-strip whose margin rests in the seat beneath the plate.

3. In a badge the combination with the body provided with an opening, of a marginal seat around the opening, a plate normally fitting in the seat, a spring-arm upon the plate, means for pivoting the arm to the body so as to swing in a plane parallel to the body, and a legend-strip resting in the seat beneath the plate.

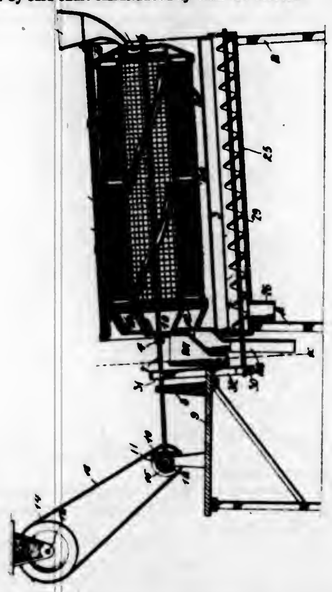
813,625. **ASH-SIFTER.** CHARLES H. DOW, Boston, Mass. Filed Apr. 17, 1905. Serial No. 255,578.



Claim.—In an ash-sifter, in combination, a circular casing open at its bottom and closed at its top and sides, said casing having an inlet-mouth and a discharge-orifice in its side opposite said inlet-mouth, a substantially flat screen of substantially the diameter of said casing and inclined from the inlet-mouth to said discharge-orifice, a substantially vertical shaft located in said casing and to which said screen is secured to rotate therewith, a support for said shaft secured to the said casing within the same, a handle located above the casing and secured to said shaft and stops on said casing between which said handle is extended, substantially as described.

813,626. **CANDY-SCREENING MACHINE.** FRANK W. DEAUDT, Zion City, Ill. Filed Apr. 6, 1905. Serial No. 254,269.

Claim.—The herein-described candy-screening machine comprising the fixed inclined cylindrical body having the longitudinal opening in its under side, the trough under said opening, the conveyer-worm in said trough, the hinged bars at the ends of the body, the shaft journaled in bearings in said hinged bars, the inner and outer screens carried and revolved by said shaft, the discharge-spouts for the respective inner and outer screens, at the lower ends thereof, the spiral blades in the inner screen, and the power connections between the shaft and the conveyer-worm whereby said worm is driven by said shaft simultaneously with the screens.



813,627. **CEMENT-BURNING PROCESS AND APPARATUS THEREFOR.** BYRON E. ELDRED, Brookline, Mass., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Filed Sept. 9, 1904. Serial No. 223,579.

Claim.—1. The herein-described process which consists in passing over a body of cement-forming material in an unobstructed reverberative chamber a flame supported from an external fuel-bed and regulated by means of a gaseous diluent passed through the fuel, to a temperature suited to calcination but not to complete sintering of the material.

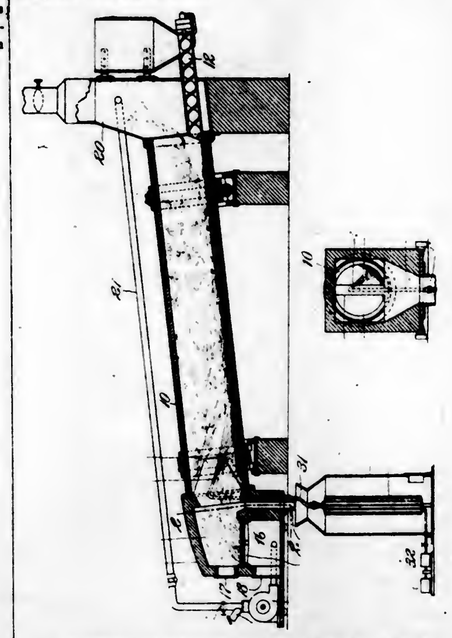
2. The herein-described process which consists in treating cement-forming material with a low-temperature calcining-flame supported from an external fuel-bed, and sintering the material with a local high-temperature flame.

3. Process of burning cement which consists in subjecting the material to a calcining-flame produced from an external fuel-bed with a portion of stack-gases in the supply-current of the fire, and locally intensifying a portion of said flame with a gaseous jet to produce a clinkering temperature.

4. Process of burning cement which consists in feeding a stream of the cement-forming material along the hearth of a reverberative chamber, passing thereover in an opposite direction a long slow-burning flame given off from an external fuel-bed through which is passed under forced draft air and a portion of diluent stack-gases, and locally intensifying a portion of said flame near the exit of the material by means of a transverse jet of air intercepting the flame or gas-current and directed upon the material.

5. A cement-burning apparatus comprising a reverberative hearth-chamber having provision for advancing the material, an external fire-box opening into said chamber and having means for burning a bed of fuel, means for supplying air and a neutral gas to the draft-chamber of the fire-box whereby a long slow-burning flame is projected over the material on the hearth, and means for producing a local high-temperature flame to sinter the material near the end of its travel.

6. A cement-furnace comprising a rotary inclined barrel, an external fire-box opening into said barrel and having a fuel-support, means to supply a diluent gas to said fire-box anterior to the fuel-support, a jet-nozzle commanding the outlet of said fire-box and directed onto the floor of said barrel, and a source of compressed air connected with said jet-nozzle.



7. A cement-kiln comprising a rotary inclined barrel having a stack at one end, an external fire-box at the other end removable from the barrel and having a conduit connection between its ash-pit and the stack, and an air-jet nozzle carried by the fire-box and commanding the outlet therefrom into the barrel.

8. A cement-kiln comprising a material-treating flame-chamber, an external fire-box having a plurality of openings into said chamber, and an air-jet nozzle commanding one of said openings and arranged at an angle, to deflect the flame onto the floor of the chamber.

9. A cement-kiln comprising a reverberative chamber, an external fire-box having means for producing a slow-burning artificially-inflated flame, a partition dividing the outlet from said fire-box into a plurality of portions, and a jet-nozzle mounted on said partition and commanding one of the portions.

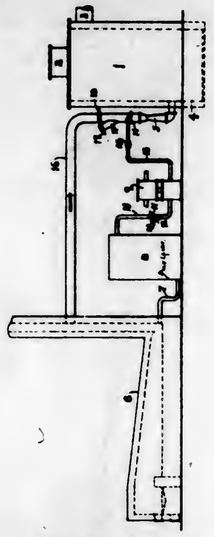
10. A furnace for burning cement and other materials comprising a rotary inclined barrel having means for introducing the materials at the upper end and removing them at the lower end, an external fire-box adapted to burn solid fuel and connected with one end of said barrel, means for returning a small portion of products of combustion to the draft-chamber of the fire-box for retarding the combustion, and means for regulating the quantity of said products returned.

11. A furnace for burning cement and other materials comprising a working chamber having means for advancing the material therethrough, means connected with said chamber for burning solid fuel externally thereof, means for forming separate flames at different points along said chamber from the combustion of said fuel, and means for rendering one of said flames substantially hotter than the other.

813,628. **PROCESS OF OPERATING GAS-PRODUCERS.** BYRON E. ELDRED, Brookville, N. Y., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Filed Aug. 10, 1905. Serial No. 273,666.

Claim.—1. The process of operating a gas-producer which consists in inducing and controlling a draft-current of commingled air

and products of combustion into said gas-producer by means of an inductive jet of products of combustion.



2. The process of operating a gas-producer which consists in inducing and controlling a draft-current containing regulated proportions of air and of products of combustion by means of a jet of air and products of combustion, and introducing said jet and entrained gaseous mixture into the producer.

3. The process of operating a gas-producer which consists in feeding into the same a high-pressure jet of commingled air and products of combustion through an unsealed passage-way containing a similar mixture whereby the feed will be responsive to the pressure in the producer.

4. The process of operating a gas-producer which consists in cooling, purifying and compressing products of combustion, forming the compressed gas into an inductive jet and impelling therewith an additional portion of products of combustion into a producer.

5. The process of operating a gas-producer which consists in employing an inductive jet of cooled and purified products of combustion to impel another portion of products of combustion into a producer.

813,629. GAS-PRODUCER. CARLETON ELLIS, New York, N. Y., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Filed Mar. 27, 1905. Serial No. 252,627.

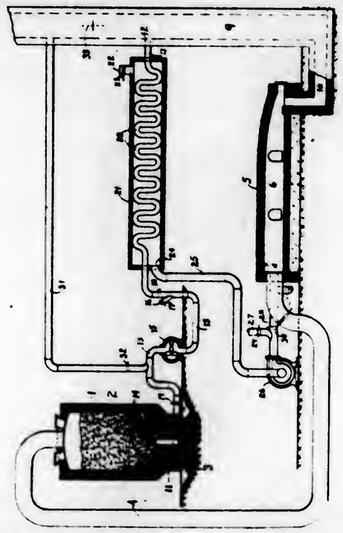
Claim.—1. In a gas making and using apparatus, the combination of a gas-fired furnace, a gas-producer for supplying gas thereto, means for supplying the producer with air, means for delivering products of combustion from the furnace to the producer and externally-cooled means for removing heat from said products prior to their entry into the producer.

2. In a gas-producing plant, the combination of a furnace producing products of combustion weak in carbon dioxid, a gas-producer, means for introducing a portion of said products into the producer and externally-cooled means for removing heat from the products prior to their entry into the producer.

3. In a gas-producing plant, the combination of a gas-producer, a furnace furnishing products of combustion containing an excess of oxygen and means for introducing a portion of said products into the producer, said means including a surface cooler.

4. In a gas-producing plant, the combination of a gas-producer provided with an air-feed of means for introducing controlled proportions of cold products of combustion into said air-feed.

5. In a gas-producing plant, the combination of a furnace furnishing products of combustion weak in carbon dioxid, a gas-producer, a conduit for conducting a portion of said products to the gas-producing zone of the producer, a mechanical draft-accelerator in said conduit, externally-cooled means for abstracting heat from said products forming a portion of the conduit, means for furnishing air to the producer and means for regulating the proportions of air and of products introduced.



6. In a gas-producing plant, the combination of a gas-producer and means for furnishing cold products of combustion to said producer under forced draft.

7. In a gas-producing plant, the combination of a gas-producer and means for furnishing air and cold products of combustion to said producer under a forced draft.

8. In a gas-producing plant, the combination of a gas-producer, a source of products of combustion, a pipe connection between such source and the producer, and a casing for containing cooling fluid mounted on the pipe connection.

9. In a gas-producing plant, the combination of a gas-producer, a source of products of combustion, a pipe connection between such source and the producer, a casing for containing cooling fluid mounted on the pipe connection, a fan for transmitting products of combustion through the pipe connection, and an air-inlet in the suction side of the fan.

10. In a gas-producing plant, the combination of a furnace, a gas-producer, a pipe connection delivering products of combustion from the furnace into the producer, a casing mounted on the pipe connection and having an air-inlet and means for inducing an air-flow through said casing to cool the products of combustion and for delivering the air heated thereby to assist combustion in the furnace.

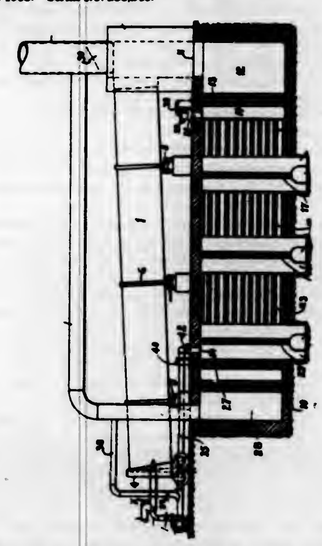
11. In a gas-producing plant, the combination of a furnace, a gas-producer, a pipe connection delivering products of combustion from the furnace into the producer, a pipe connection delivering gas from the producer into the furnace, a casing mounted on the first pipe connection, and means for drawing air through the casing to cool the pipe and for delivering the air to the furnace to assist in the combustion of the gas.

12. In a gas making and using plant, the combination of a gas-producer, a gas-using device fed thereby, a chimney-stack for the latter, a pipe tapping the chimney, a cooling-casing surrounding the pipe, a fan drawing products of combustion through the pipe and delivering the same into the producer and a valved air-inlet on the pipe on the suction side of the fan.

13. In a gas making and using plant, the combination of a gas-producer, a gas-using device fed thereby, a chimney-stack for the latter, a pipe tapping the chimney, a cooling-casing surrounding the pipe, a fan and pipe connections for drawing air through the casing and delivering into the furnace provided with an excess-outlet on the pipe connections on the pressure side of the fan, a fan and pipe connections for withdrawing products of combustion from the chimney through the first-mentioned pipe and delivering the same into the producer.

14. In a gas making and using plant, the combination of a gas-producer, a gas-using device fed thereby, a chimney-stack for the latter, a pipe tapping the chimney, a cooling-casing surrounding the pipe, a fan and pipe connections for drawing air through the casing and delivering into the furnace, a fan and pipe connections for withdrawing products of combustion from the chimney through the first-mentioned pipe and delivering the same into the producer, and a valved waste-outlet on the pipe connection between the producer and the fan.

813,630. HEAT-REGENERATOR FOR CEMENT-KILNS. CARLETON ELLIS, New York, N. Y., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Filed Apr. 18, 1905. Serial No. 256,246.



Claim.—1. A cement-making apparatus comprising a kiln and a regenerative air-heater therefor abstracting waste gases from the kiln and provided with a succession of alternating constricted and expanded passages, the latter passages being provided with dust-removing doors.

2. A cement-making apparatus comprising a kiln and a regenerative air-heater therefor abstracting waste gases from said kiln and provided with a plurality of dust-collecting chambers and a plurality of regenerative devices, successively and alternately arranged.

3. A cement-making apparatus comprising a kiln and a regenerative air-heater therefor abstracting waste gases from said kiln and provided with a plurality of dust-collecting chambers alternating with constricted passages lined with refractory materials.

4. A cement-making apparatus, comprising a kiln and a regenerative air-heater therefor abstracting waste gases from said kiln and provided with a plurality of successive regenerative devices alternating with dust settling and collecting chambers containing baffle-plates.

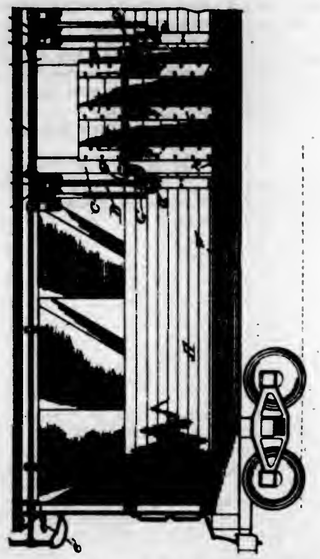
5. A cement-making apparatus comprising a kiln, a housing for the gas-exit end thereof, a chimney-stack connected to the housing, a regenerative air-heater also connected to the housing at a point remote from the main draft therethrough and abstracting a portion of the waste gases from said housing and means for collecting and settling dust in said regenerative air-heater.

6. In a cement-making apparatus, the combination of a kiln, air-feeding means, fuel-feeding means, a regenerative air-heater heated by waste gases from the kiln and means for withdrawing a portion of said gases after passing through the heater and adding said portion to the heated air.

7. A cement-making apparatus comprising a kiln and a regenerative air-heater therefor, said heater containing a series of tiers of heat-absorbing bodies arranged with passages therebetween and said tiers being spaced apart to form dust-settling chambers.

8. A cement-making apparatus comprising a kiln and a regenerative air-heater therefor, said heater containing a series of tiers of heat-absorbing bodies arranged with passages therebetween, said tiers being spaced apart to form dust-settling chambers, and baffle-plates in said chambers.

813,631. DOOR FOR GRAIN-CARS. VICTOR BLANCHARD, Chicago, Ill. Filed Dec. 13, 1904. Serial No. 236,544.



Claim.—1. The combination with a car-body having a suitable doorway in the side thereof, of a grain-door, a pintle-bolt from which said door is suspended, two revolving vertical screws arranged one on one side and the other on the other side of said doorway, internally-screw-threaded non-revolving sleeves on said screws having L-shaped projections extending above the same which are provided with horizontal bearing-bosses in which the ends of the pintle-bolt are journaled, and means engaging said screws whereby said sleeves and the parts carried thereby are raised and lowered.

2. The combination with a car-body having a suitable doorway in the side thereof, of a swinging grain-door, a pintle-bolt from which said door is suspended, an auxiliary door mounted thereon and adapted to be swung above said first-mentioned door, two revolving vertical screws arranged one on one side and the other on the other side of said doorway, internally-screw-threaded non-revolving sleeves on said screws having L-shaped projections extending above the same which are provided with horizontal bearing-bosses in which the ends of the pintle-bolt are journaled, miter-gears on the upper ends of said screws, a longitudinal shaft, miter-pinions thereon engaging said miter-gears, and a hand-wheel mounted on said shaft on the outside of said car for revolving said shaft whereby said door is raised and lowered.

3. The combination with a car-body having a suitable doorway in the side thereof, of a grain-door, a pintle-bolt from which said door is suspended, a superimposed auxiliary door pivotally connected to said pintle, two revolving vertical screws arranged one on one side and the other on the other side of said doorway and internally-screw-threaded non-revolving sleeves on said screws in which the ends of said pintle-bolt are journaled.

4. The combination with a car-body having a suitable doorway in the side thereof, of a grain-door, a pintle-bolt from which said door is suspended, a superimposed auxiliary door pivotally connected to said pintle, two revolving vertical screws arranged one on one side and the other on the other side of said doorway, internally-screw-threaded non-revolving sleeves on said screws in which the ends of said pintle-bolt are journaled and bearings in which the heels of said screws are journaled and columns supporting the same.

5. The combination with a car-body having a suitable doorway in the side thereof, of a grain-door, a pintle-bolt from which said door is suspended, a superimposed auxiliary door pivotally connected to said pintle, two revolving vertical screws arranged one on one side

and the other on the other side of said doorway, internally-screw-threaded non-revolving sleeves on said screws in which the ends of said pintle-bolt are journaled, miter-gears on the upper ends of said screws, a longitudinal shaft, miter-pinions thereon engaging said miter-gears, and a hand-wheel mounted on said shaft on the outside of said car for revolving said shaft whereby said door is raised and lowered.

6. In a car-fender, the combination with a fender-frame, of means adapted to be pivotally attached to a car to rise and fall rela-

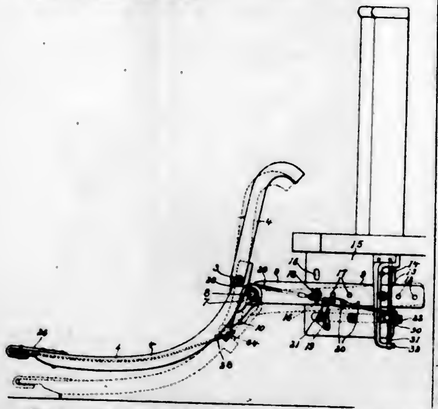
4. In a camera obscura, the combination with a lens, of a plurality of sensitized surfaces and means for moving the surfaces into

ing either from the outside or inside through the red when located in the sash will be refracted.

and the other on the other side of said doorway, internally-screw-threaded non-revolving sleeves on said screws in which the ends of said pintle-bolt are journaled, miter-gears on the upper ends of said screws, a longitudinal shaft, and miter-pinions thereon engaging said miter-gears.

6. The combination with a car-body having a suitable doorway in the side thereof, of a grain-door, a pintle-bolt from which said door is suspended, a superimposed auxiliary door pivotally connected to said pintle, two revolving vertical screws arranged one on one side and the other on the other side of said doorway, internally-screw-threaded non-revolving sleeves on said screws in which the ends of said pintle-bolt are journaled, miter-gears on the upper ends of said screws, a longitudinal shaft, miter-pinions thereon engaging said miter-gears, and means on the outside of said car for operating said shaft.

813,632. CAR-FENDER. FRANK J. FAIRCHILD, Detroit, Mich., assignor to The Automatic Car Fender Co., Wyandotte, Mich. Filed June 21, 1905. Serial No. 266,945.



Claim.—1. In a car-fender, the combination with a suitably-curved fender-frame having pivots at its rear side, of horizontally-extending supporting-bars adapted to be secured to a car and provided with bearings for the said pivots, and downwardly-extending ends on said bars adapted to engage the lower side of the frame and support the same in its extended position in the desired position above the track.

2. In a car-fender, the combination with a fender-frame, of horizontally-extending supporting-bars forming the sole support for said frame and to the forward ends of which said frame is adapted to be attached, means for pivotally attaching said bars to the body of the car near their rear ends to permit a vertical movement of their forward ends, and means carried by the body of the car for normally supporting said forward ends of the bars in their raised position and permitting the same to fall to lower the fender-frame.

3. In a car-fender, the combination with a fender-frame, of horizontally-extending supporting-bars to the forward ends of which the frame is pivotally attached forming the sole supports for said frame, downwardly-extending ends on said bars adapted to engage beneath the frame to support the same in a position relative to the bars, and means for supporting the bars and permitting the same to fall to lower the frame.

4. In a car-fender, the combination with a fender-frame, of supporting-bars to the forward ends of which said frame is pivotally attached and adapted to be pivotally attached near their rear ends to a car, means for supporting the forward ends of said bars in their raised position, and means operated by contact with an obstacle in the path of the car for actuating said supporting means to permit the bars to drop and lower the fender-frame.

5. In a car-fender, the combination with a fender-frame, of supporting-bars adapted to be pivotally secured near their rear ends to a car to rise and fall at their forward ends and to the forward ends of which the frame is pivotally attached, means for limiting the downward movement of said bars to support the same in their lowered position, means for supporting said bars in their raised position and for releasing the same, and a cable extending across the forward side of the fender-frame for operating the supporting means.

6. In a car-fender, the combination with a fender-frame, of means adapted to be pivotally attached to a car to rise and fall relative to the car and forming the sole support for the frame, means for supporting said means in a raised position, and a cable extending across the forward side of the frame to contact obstructions in the path of the car and to be operated by such contact to release the said supporting means for the bars and permit the same to drop.

7. In a car-fender, the combination with a fender-frame, of hangers secured to the car, supporting-bars to the forward ends of which the frame is attached pivotally secured to said hangers near their rear ends, toggle-joints for supporting the forward ends of said bars in their raised positions, means for holding said toggle extended to support said bars, and a cable connected to said holding means to move the same out of the path of the toggles and extending across the front of the fender-frame at a distance in advance thereof.

8. In a car-fender, the combination with a fender-frame, of means for supporting said frame pivotally attached to a car to turn on said pivots and lower the fender-frame, supporting means to hold said means raised and to permit the same to fall, pulleys journaled on the fender-frame at the forward corners thereof, pulleys at each side of the frame near the rear thereof, a cable adapted to operate said supporting means and extending across the forward side of the frame, around said pulleys at the forward corners, rearward beneath the side bars of the frame and over the rear pulleys.

9. In a car-fender, the combination with a fender-frame of hangers secured to the car and each provided with an opening and a slot curved concentrically with said opening, supporting-bars to the forward ends of which the frame is attached, pivot-bolts for said bars extending through the openings in the hangers, guide-bolts carried by said bars engaging the slots, toggle-joints pivotally attached at one end to the hangers and at their opposite ends to the bars, and pins adapted to be projected into the path of the toggles to hold the same extended.

10. In a car-fender, the combination with a fender-frame, of hangers adapted to be secured to a car, supporting-bars to the forward ends of which the frame is attached pivotally secured near their rear ends to the said hangers, toggle-joints pivotally attached at one end to the hangers and at their opposite end to the bars, pins adapted to be projected through openings in said hangers into the path of said toggle-joints, levers pivoted intermediate their ends and attached at one end to said pins, and a cable attached to the opposite ends of said levers and extended forward and across the forward side of the fender-frame.

11. In a car-fender, the combination with a fender-frame, of hangers adapted to be secured to a car, supporting-bars to the forward ends of which the frame is attached, pivotally secured near their rear ends to the said hangers, means for supporting the forward ends of said bars, pins adapted to hold said means, levers pivoted intermediate their ends on the hangers and attached at one end to said pins, springs interposed between the opposite ends of said levers and the hangers, stops to limit the movement of the levers, and a cable secured at its ends to the ends of said levers and extended forward and across the forward side of the said frame.

12. In a car-fender, the combination with a fender-frame, of hangers adapted to be secured to a car, supporting-bars to the forward ends of which the frame is pivotally attached, pivoted near their rear ends to said hangers, toggle-joints for supporting the bars at their forward ends, pins extending through the hanger, levers pivoted upon a post on the hangers intermediate their ends and to one end of which levers the said pins are attached, a coiled spring interposed between the opposite ends of said levers and the hangers, stops on the levers to engage the hangers and limit the compression of said springs, brackets supported adjacent to the hangers, pulleys journaled on said brackets, pulleys journaled on the said fender-frame near its four corners, a cable passing over all of said pulleys and secured at its ends to the levers, and a turn-buckle in the cable.

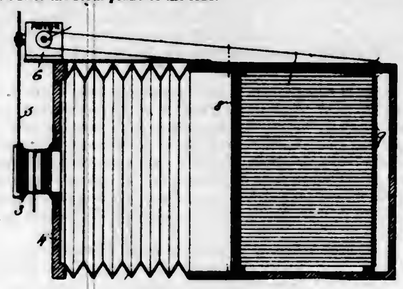
813,633. CAMERA. HERAN A. FARRAND, New York, N. Y. Filed June 10, 1904. Serial No. 211,894.

Claim.—1. A plurality of separate sensitised surfaces forming a continuous common plane and means for moving the surfaces into and out of said plane.

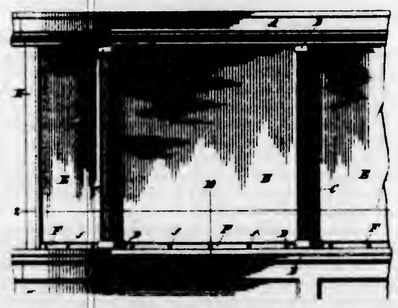
2. A plurality of sensitised surfaces forming a continuous common plane and means for simultaneously bringing predetermined portions of the surfaces into an exposed position for receiving an impression thereon.

3. In a camera obscura, the combination with a lens, of a plurality of sensitized surfaces located in the focal plane of the lens.

4. In a camera obscura, the combination with a lens, of a plurality of sensitised surfaces and means for moving the surfaces into and out of the focal plane of the lens.



813,634. SHOW-WINDOW. SIGMUND FRIED, New York, N. Y. Filed Apr. 27, 1904. Serial No. 205,282.



Claim.—1. In a show-window the combination with top and bottom rails and panes of glass of ordinary construction a rod made of translucent glass having a flat surface or surfaces along its length for the panes of glass to bear against and having its exposed surface cut or molded, said rod being so located in the sash that the light can pass through it from within or without the window and be refracted.

2. In a show-window the combination consisting of a shaft of translucent glass having a flat surface or surfaces along its length for the panes of glass to bear against when placed in position, two moldings following the line of the perimeter of said shaft exclusive of said bearing-surface and provided with holes for attaching devices, one molding being adapted to hold said shaft in position at one end and the other, at the other end, two shields adapted respectively to fit one upon the base-molding and the other the top molding and cover the heads of the attaching devices therein.

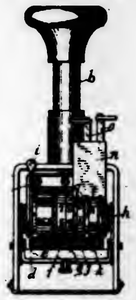
3. In a show-window the combination with top and bottom rails and panes of glass of ordinary construction, a window-rod made of translucent glass and having a surface or surfaces along its length for the panes of glass to bear against two moldings one partly surrounding the top and the other the bottom of the rod and each furnished with holes for attaching devices to secure the rod in position in the sash and two shields respectively fitting upon the moldings and covering the heads of the attaching devices therein.

4. In a show-window the combination of a sash-rod consisting of a shaft of translucent glass having a flat surface or surfaces along its length for the panes of glass to bear against when placed in position, two moldings following the line of the perimeter of said shaft exclusive of said bearing-surface and provided with holes for attaching devices, one molding being adapted to hold said shaft in position at one end and the other at the other end, a secondary shaft made of glass and narrower than but of equal length with the main shaft and placed longitudinally along the opposing edges of the panes of glass set between such shafts, two shields adapted respectively to fit one upon the base-molding and the other the top molding and cover the heads of the attaching devices therein.

5. A window-sash rod of translucent glass made with a flat surface or surfaces along its length for panes of glass to bear against and having its exposed surface cut or molded so that the light passing either from the outside or inside through the rod when located in the sash will be refracted.

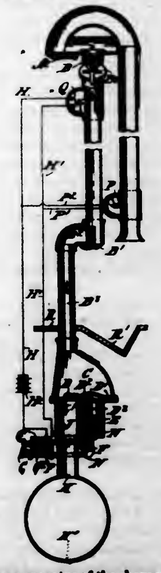
6. A window-sash rod of translucent glass made with a flat surface or surfaces along its length for the panes of glass to bear against and having its exposed surface fluted and being adapted to be located in a sash so that the light passing through it from within or without the window will be refracted.

813,635. HAND DATING-STAMP. WILBUR I. FOLLETT, Needham, N. J., assignor to Follett Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Aug. 28, 1903. Serial No. 171,141.



Claim.—In a hand dating-machine, the combination with the supporting-frame, a plunger reciprocating therein and the wheel-frame carried by the plunger, of a gang of dating-wheels comprising hour and minute wheels, a casing carried by the wheel-frame and having two plunger-channels and two spring-channels, a plunger mounted in each plunger-channel, a plunger-support spring-mounted in each spring-channel and appropriately connected to the casing and to its plunger, and a wheel-driving pawl pivoted in the lower end of each plunger, substantially as set forth.

813,636. PNEUMATIC-DESPATCH-TUBE APPARATUS. EDMOND A. FORDYCE, Boston, Mass., assignor to Lamson Consolidated Store Service Company, Newark, N. J., a Corporation of New Jersey. Filed Mar. 24, 1905. Serial No. 251,770.



Claim.—1. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling

the passage of air through said tube and normally closed, an exhaust-tube, mechanism under the control of said exhaust-tube for operating said valve, an electric circuit for controlling said mechanism, and a switch in said circuit operated by the passage of a carrier through the transit-tube.

10. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the

lar on the front of the hanger in register with the opening of same, a spring-controlled check-valve in the nozzle-bore having a stem pro-

and resting upon the first board and having holes in which the bottoms of the solenoids fit, a third board fitted against the tops of the

the passage of air through said tube and normally closed, an exhaust-tube, mechanism under the control of said exhaust-tube for operating said valve, an electric circuit for controlling said mechanism, and mechanism operated by the insertion of a carrier into said tube to close said circuit for opening said air-valve and allowing a passage of air through said tube for driving carriers.

2. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the passage of air through said tube and normally closed, an exhaust-tube, mechanism under the control of said exhaust-tube which normally holds said air-valve closed, an electric circuit for controlling said mechanism, and mechanism operated by the insertion of a carrier into said tube to close said circuit for opening said air-valve to allow a passage of air through said transit-tube.

3. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the passage of air through said tube and normally closed, an exhaust-tube, mechanism under the control of said exhaust-tube for operating said valve, an electric circuit for controlling said mechanism, and mechanism operated by the carrier upon its insertion into the transit-tube to close said circuit for opening said air-valve, and allowing the closing of said air-valve after the insertion of the carrier.

4. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve for controlling the passage of air through said transit-tube and normally closed, an exhaust-tube, mechanism under the control of said exhaust-tube which normally holds said air-valve closed, an electric circuit for controlling said mechanism, and means operated by the closing of said circuit for admitting atmospheric pressure to said mechanism to open said air-valve upon the insertion of a carrier into said transit-tube to allow a passage of air through said transit-tube for the transmission of carriers.

5. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve for controlling the passage of air through said transit-tube and normally closed, an exhaust-tube, mechanism under the control of said exhaust-tube which normally holds said air-valve closed, an electric circuit for controlling said mechanism, means operated by the closing of said circuit for admitting atmospheric pressure to said mechanism to open said air-valve upon the insertion of a carrier into said transit-tube to allow a passage of air through said transit-tube for the transmission of carriers, and means for regulating the closing of said air-valve.

6. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the passage of air through said tube and normally closed, an exhaust-tube, mechanism under the control of said exhaust-tube for operating said valve, an electric circuit for controlling said mechanism, and mechanism operated by the carrier upon its insertion into the transit-tube to close said circuit for opening said air-valve, allowing the closing of said air-valve after the insertion of the carrier, and means for regulating the closing of said air-valve.

7. In an apparatus of the character described, transit-tubes through which carriers are transmitted in opposite directions, an air-valve controlling the passage of air through said transit-tubes and normally closed, an exhaust-tube in communication with both of said transit-tubes, mechanism under the control of said exhaust-tube which normally holds said air-valve closed, an electric circuit for controlling said mechanism, and means operated by the insertion of a carrier into said tube to close said circuit for opening said air-valve to allow a passage of air through said transit-tube.

8. In an apparatus of the character described, transit-tubes through which carriers are transmitted in opposite directions, an air-valve controlling the passage of air through said transit-tubes and normally closed, an exhaust-tube in communication with both of said transit-tubes, mechanism under the control of said exhaust-tube which normally holds said air-valve closed, an electric circuit for controlling said mechanism, and means operated by the closing of said circuit for admitting atmospheric pressure to said mechanism to open said air-valve upon the insertion of a carrier into said transit-tube to allow a passage of air through said transit-tubes for the transmission of carriers.

9. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the passage of air through said tube and normally closed, an exhaust-tube, an electric circuit, and mechanism under the control of said exhaust-tube for opening said valve upon the closing of said circuit and allowing the passage of air through said transit-tube for the transmission of carriers.

10. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the passage of air through said tube and normally closed, an exhaust-tube, an electric circuit, and mechanism under the control of said exhaust-tube for automatically opening said valve upon the closing of said circuit and allowing the passage of air through said transit-tube for the transmission of carriers.

11. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the passage of air through said tube and normally closed, an exhaust-tube, an electric circuit, and mechanism under the control of said exhaust-tube for automatically opening said valve upon the closing of said circuit and allowing the passage of air through said transit-tube for the transmission of carriers, and for automatically allowing said air-valve to move into its closed position after the insertion of the carrier.

12. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the passage of air through said tube, an exhaust-tube in communication with said transit-tube and normally closed by said air-valve, mechanism under the control of said exhaust-tube and normally holding said air-valve closed, an electric circuit, and means for admitting atmospheric pressure to said mechanism upon the closing of said circuit to open said air-valve to allow the passage of air through said transit-tube for the transmission of carriers.

13. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the passage of air through said tube, an exhaust-tube in communication with said transit-tube and normally closed by said air-valve, mechanism under the control of said exhaust-tube and normally holding said air-valve closed, an electric circuit, and means operated upon the closing of said circuit for admitting atmospheric pressure to said mechanism to open said air-valve to allow the passage of air through said transit-tube for the transmission of carriers and adapted to cut off atmospheric pressure from said mechanism to allow said mechanism toclose said air-valve.

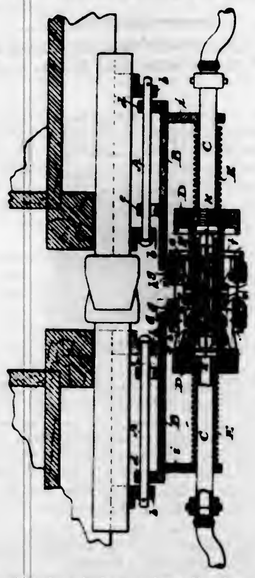
14. In an apparatus of the character described, a transit-tube through which carriers are transmitted, an air-valve controlling the passage of air through said tube, an exhaust-tube in communication with said transit-tube and normally closed by said air-valve, mechanism under the control of said exhaust-tube and normally holding said air-valve closed, an electric circuit, and means operated upon the closing of said circuit for admitting atmospheric pressure to said mechanism to open said air-valve to allow the passage of air through said transit-tube for the transmission of carriers and adapted to cut off atmospheric pressure from said mechanism to close said air-valve automatically.

15. In a pneumatic-tube system, the combination of a pneumatic tube, two or more stations thereon, a vacuum-pipe connected to said tube, an air-valve controlling said connection and normally closed, an electrically-controlled mechanism for opening said valve, a circuit-wire for said mechanism, and means at each station for opening and closing said circuit and energizing or deenergizing the valve-actuating magnet.

813,687. **TRAIN-PIPE COUPLING.** JOHN A. FRENNER, WAUSAU, WIS. Filed Dec. 14, 1905. Serial No. 291,884.

Claim.—1. The combination of a rod for suspension from a railway-car longitudinally of the same, a tilt-hanger in longitudinally-adjustable swing connection with the rod, a train-pipe section loose in an arm of the hanger and provided with a head, a spiral spring on the pipe-section under tension between the hanger-arm and pipe-head, a longitudinally-recessed nozzle extending from said pipe-head through a front opening in said hanger and provided with a forward packing-gasket surrounding its bore and projecting therefrom, a spring-controlled check-valve in the nozzle-bore having a stem provided with a head that normally projects beyond said nozzle, and grip-levers arranged in the nozzle-recesses to come in and out of engagement with a flange of a meeting nozzle similar to the one aforesaid.

2. The combination of a rod for suspension from a railway-car longitudinally of the same, a tilt-hanger in longitudinally-adjustable swing connection with the rod, a train-pipe section loose in an arm of the hanger and provided with a head, a spiral spring on the pipe-section under tension between the hanger-arm and pipe-head, a longitudinally-recessed nozzle extending from said pipe-head through a front opening in said hanger and provided with a forward packing-gasket surrounding its bore and projecting therefrom, a beveled collar on the front of the hanger in register with the opening of same, a spring-controlled check-valve in the nozzle-bore having a stem provided with a head that normally projects beyond said nozzle, and grip-levers arranged in the nozzle-recesses to come in and out of engagement with a flange of a meeting nozzle similar to the one aforesaid, the outer ends of the levers of one nozzle being caught within the confines of the beveled collar of the other nozzle.



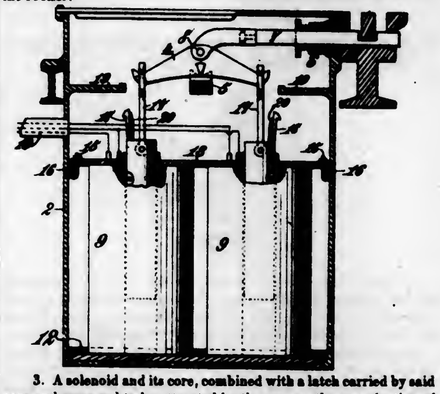
3. The combination of a hanger depending from a railway-car, a train-pipe section loose in an arm of the hanger and provided with a head, a spiral spring on the pipe-section under tension between the hanger-arm and pipe-head, a longitudinally-recessed nozzle extending from said pipe-head through a front opening in said hanger and provided with a forward packing-gasket surrounding its bore and projecting therefrom, a spring-controlled check-valve in the nozzle-bore having a stem provided with a head that normally projects beyond said nozzle, and grip-levers arranged in the nozzle-recesses to come in and out of engagement with a flange of a meeting nozzle similar to the one aforesaid, the outer ends of the levers of one nozzle being caught within the confines of the beveled collar of the other nozzle.

4. The combination of a hanger depending from a railway-car, a train-pipe section loose in an arm of the hanger and provided with a head, a spiral spring on the pipe-section under tension between the hanger-arm and pipe-head, a longitudinally-recessed nozzle extending from said pipe-head through a front opening in said hanger and provided with a forward packing-gasket surrounding its bore and projecting therefrom, a beveled collar on the front of the hanger in register with the opening of same, a spring-controlled check-valve in the nozzle-bore having a stem provided with a head that normally projects beyond said nozzle, and grip-levers arranged in the nozzle-recesses to come in and out of engagement with a flange of a meeting nozzle similar to the one aforesaid, the outer ends of the levers of one nozzle being caught within the confines of the beveled collar of the other nozzle.

813,688. **ELECTRICALLY-OPERATED CONTROLLING MECHANISM.** GEORGE H. PRENTIS, Springfield, Mass. Filed May 13, 1905. Serial No. 260,315.

Claim.—1. The combination of a switch-tongue, a casing, a pair of solenoids in said casing, a rocker provided with a knife-edge fulcrum, a V-shaped bearing in the casing for supporting said fulcrum, rods provided with knife-edges, the opposite branches of the rocker having V-shaped bearings to support said last-mentioned knife-edges, and the rods being connected with the cores of the respective solenoids, and operative connections between the rocker and the switch-tongue.

2. The combination of a casing, a board fitted in the casing, solenoids supported upon the board, a second board fitted in the casing and resting upon the first board and having holes in which the bottoms of the solenoids fit, a third board fitted against the tops of the solenoids, the latter having tubes extending upward therefrom and the third board having holes for the passage of the tubes, means for clamping the third board against the solenoids, a rocker fulcrumed between its ends in the casing, the opposite branches thereof being operatively connected with the cores of the solenoids, a switch-tongue, and operative connections between the switch-tongue and the rocker.



3. A solenoid and its core, combined with a latch carried by said core and arranged to be attracted by the core on the energization of said solenoid.

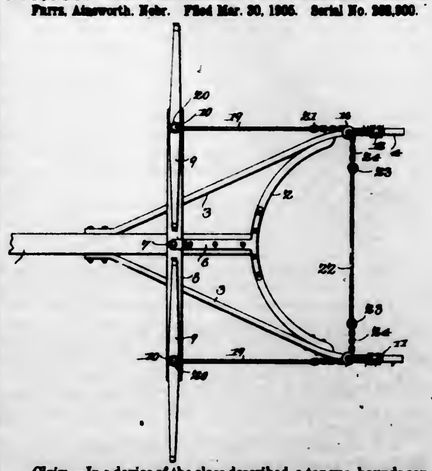
4. The combination of a solenoid and its core, a latch carried by the core and arranged to be attracted by the core on the energization of the solenoid, and a brass spring between the latch and the core.

5. The combination of a solenoid and its core, the latter having a channel, and a latch pivotally supported in the channel and arranged to be attracted by the core on the energization of the solenoid.

6. The combination of a pair of solenoids and their cores, latches carried by the cores and arranged to be attracted thereby on the energization of the respective solenoids, and catches arranged to be alternately engaged by the latches.

7. The combination of a pair of solenoids and their cores, latches carried by the cores and arranged to be attracted thereby on the energization of the respective solenoids, catches arranged to be alternately engaged by the latches, a switch-tongue, and connections between the solenoid-cores and switch-tongue for operating the latter.

813,689. **DRAFT ATTACHMENT FOR VEHICLES.** JOHN H. PRITZ, Ainsworth, Nebr. Filed Mar. 30, 1905. Serial No. 253,900.



Claim.—In a device of the class described, a tongue, hounds connected therewith, brackets secured adjustably by means of clips

upon said hounds and having upwardly-extending flanges, bolts extending through apertures in said flanges and secured adjustably by means of nuts bearing against the front and rear sides of said flanges, said bolts having bifurcated heads, said heads

ular groove into a cavity in the hammer a punch extending into the said cavity in the hammer; a trigger consisting of a circular head to fit said annular groove, and an arm extending from said head at

2. A clock-movement provided with a mainspring, hands, a hammer, means for alternately operating the hands and the ham-

Claim.—In a wrench, the combination with a handle, having jaws at the end thereof, of a sleeve slidable on the handle, an adjust-

upon said bounds and having upwardly-extending flanges, bolts extending through apertures in said flanges and secured adjustably by means of nuts bearing against the front and rear sides of said flanges, said bolts having bifurcated heads, guide-pulleys supported for rotation in said bifurcated bolt-heads, a doubletree pivoted upon the tongue, swingletrees pivoted upon the doubletree, connecting-rods having eyes engaging the pivotal bolts of the swingletrees above the latter, and flexible connecting means for said rods engaging the pulleys supported upon the bounds.

813,640. **BRAKE BLOCK AND SHOE.** LLOYD G. GALLUP, Walton, N. Y. Filed July 17, 1905. Serial No. 270,081.

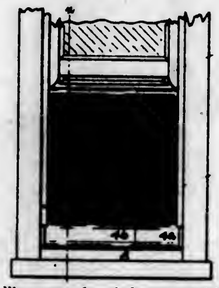
Claim.—The combination with a brake-beam of a head-block having a lateral lip bearing upon the beam and of uniform width throughout, a clamp-bolt extending through the block and beam and with a laterally-extended head embedded in the face of the block, a shoe uniform in width to the block and bearing over the face thereof and against the head of said bolt and provided with a lip bearing upon said block, and a bolt extending through said shoe and block and with a relatively flat head countersunk into the face of the shoe, whereby the block is protected from contact with the wheel and the shoe released when worn sufficiently to destroy the head of the shoe-holding bolt.

813,641. **AUTOMATIC PRICK-PUNCH.** GEORGE T. GILBERT, Northampton, Mass., assignor of one-third to Willis D. Hamilton, Springfield, Mass. Filed May 27, 1905. Serial No. 262,573.

Claim.—1. In an automatic prick-punch, a hammer, a hollow handle in which the hammer is slidable, a trigger located in an annular groove in the hammer, and a spring to move said trigger transversely of the axis of the hammer, a punch extending into a cavity in the hammer having a shoulder thereon with which said trigger may engage to hold the punch and hammer in separated relation, there being a shoulder on the inner wall of the handle which operates to move the trigger out of engagement with the punch at the proper time, and a suitable spring for the punch to move the latter away from the hammer.

2. In an automatic prick-punch, a hollow handle, a hammer slidable therein and having in the surface thereof an annular groove, and a longitudinally-disposed groove intercepting said annular groove, there being an opening extending from the bottom of the annular groove into a cavity in the hammer a punch extending into the said cavity in the hammer; a trigger consisting of a circular head to fit said annular groove, and an arm extending from said head at right angles thereto located in said longitudinal groove and constituting a spring for the trigger, the hollow handle having one end closed in which said hammer and punch are independently slidable, and a spring between the closed end of the handle and the end of the hammer.

813,642. **ROLLING WINDOW-SCREEN.** HOMER H. GILLAND and WILLIAM H. GILLAND, Saginaw, Mich. Filed May 11, 1905. Serial No. 260,893.



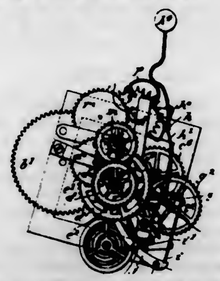
Claim.—A rolling screen for windows comprising an extensible sectional spring-actuated roller, screen members mounted on each roller-section, the adjacent edges of the screen members adapted to overlap each other, a sectional telescopic casing in which the roller is journaled, the casing adapted to receive and protect the screen members and provided with a slot through which the screen members pass, the sections of the casing each provided with integral slotted ends, a curved sectional telescoping cover for the slot, and flanges carried by the cover-sections and serving as a nailing-strip whereby to simultaneously secure the cover and the upper edges of the screen members to the sash of a window.

813,643. **ORANGE-YELLOW SULFUR DYE AND PROCESS OF MAKING SAME.** RICHARD GLEY, Berlin, Germany, assignor to Actien Gesellschaft für Anilin Fabrikation, Berlin, Germany. Filed July 1, 1905. Serial No. 268,014.

Claim.—1. The manufacture of a new sulfurized dyestuff by heating a mixture of diformylmeta-toluylenediamin and para-phenylenediamin with sulfur to above 200° centigrade.

2. The new sulfurized dyestuff obtained by the action of sulfur on a mixture of diformyl-meta-toluylenediamin and para-phenylenediamin, being, when well pulverized or ground, a brown-red powder, insoluble in water and alcohol, soluble in soda-lye with a yellow color, which solution by the addition of hydrochloric acid separates yellow-brown flakes, soluble in sodium sulfid with a yellow color, dyeing from a bath containing sodium sulfid and common salt clear orange-yellow shades of great fastness to washing and milling.

813,644. **CLOCK-MOVEMENT.** SIGMUND GOLDSMITH, New York, N. Y. Filed June 3, 1905. Serial No. 263,543.



Claim.—1. A clock-movement provided with a mainspring, hands, a hammer, and means for alternately operating the hands and hammer by the same end of said spring, substantially as specified.

2. A clock-movement provided with a mainspring, hands, a hammer, means for alternately operating the hands and the hammer by said spring, and means for arresting the hands while the hammer is actuated, substantially as specified.

3. A clock-movement provided with a mainspring, hands, a hammer, a train of gearing actuated by said spring, and means operated by said train for alternately actuating the hands and the hammer, substantially as specified.

4. A clock-movement provided with a mainspring, hands, a hammer, a pinion operated by said spring, a mutilated toothed wheel engaged by the pinion and adapted to operate the hands, and a toothed sector also engaged by the pinion and controlling the hammer, substantially as specified.

5. A clock-movement provided with a mutilated toothed wheel, a pin on said wheel, a toothed sector adapted to engage said pin, and means for rotating the wheel and sector, substantially as specified.

6. A clock-movement provided with a mutilated toothed wheel, a pin on said wheel, a toothed sector adapted to engage said pin, means for changing the relative position between wheel and sector, and means for rotating the wheel and sector, substantially as specified.

7. A clock-movement provided with a mutilated toothed wheel, a pin on said wheel, a toothed sector adapted to engage said pin, a stepped disk, a lever engaged thereby and operatively connected to the sector, and means for imparting different speed to the wheel and disk, substantially as specified.

8. A clock-movement provided with an escapement, a hammer, an axially-movable shaft, a toothed wheel and a finger on said shaft adapted to engage the escapement, means on the shaft for operating the hammer, and means for axially moving the shaft, substantially as specified.

9. A clock-movement provided with an escapement, hands, a hammer, an axially-movable shaft, a toothed wheel and a finger on said shaft adapted to engage the escapement, means on the shaft for operating the hammer, a hand-operating wheel, and means controlled by said wheel for axially moving the shaft, substantially as specified.

10. A clock-movement provided with an escapement, hands, a hammer, an axially-movable shaft, a toothed wheel and a finger on said shaft adapted to engage the escapement, means on the shaft for operating the hammer, a hand-operating wheel, a shipping-lever operatively connected thereto, and means controlled by said lever for axially moving the shaft, substantially as specified.

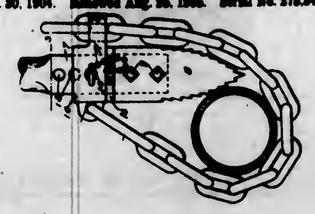
11. A clock-movement provided with hands, a hammer, a hand-operating wheel, a shipping-lever operatively connected thereto, an axially-movable shaft operatively connected to said lever, a crank on the shaft adapted to actuate the hammer, and an elbow-lever controlled by the crank and adapted to engage the shipping-lever, substantially as specified.

12. A clock-movement provided with hands, a hammer, a hand-operating wheel, a shipping-lever operatively connected thereto, an axially-movable shaft operatively connected to said lever, a crank on the shaft adapted to actuate the hammer, an elbow-lever having an eye engaged by the crank, and a notched arm adapted to engage the shipping-lever, substantially as specified.

13. A clock-movement provided with a mainspring, hands, a striking mechanism, an alarm mechanism, and means for operating the hands, the striking mechanism and the alarm mechanism by said spring, substantially as specified.

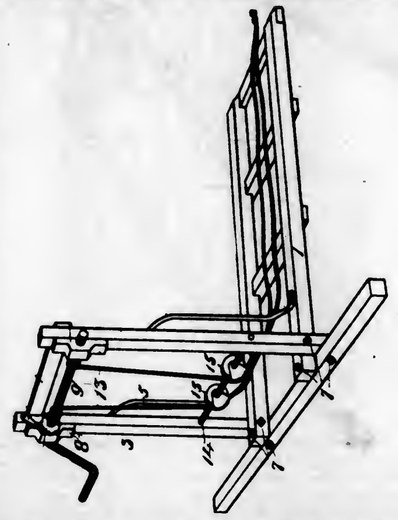
14. A clock-movement provided with a mainspring, hands, a striking mechanism, a first toothed wheel operated by said spring and adapted to actuate the hands and striking mechanism, a second toothed wheel also operated by said spring, an alarm mechanism, and means for operating said alarm mechanism by said second toothed wheel, substantially as specified.

813,645. **PIPE-WRENCH.** WILLIAM GOEHLEY, Chicago, Ill. Filed Dec. 30, 1904. Renewed Aug. 25, 1905. Serial No. 276,945.



Claim.—In a wrench, the combination with a handle, having jaws at the end thereof, of a sleeve slidable on the handle, an adjusting-wedge insertible between the jaws and the sleeve, and a chain attached at both ends to the sleeve.

813,646. **FODDER-BINDER.** JOHN GAILL, Jr., Franklin township, Summit county, Ohio. Filed Oct. 9, 1905. Serial No. 282,067.



Claim.—The combination in a device of the class described, of a pair of approximately parallel side pieces suitably united by cross-beams, a cross-bar fastened to the ends of said side pieces and extending laterally therefrom to constitute a means to prevent the overturning of said device, a pair of standards mounted adjacent said bar and attached to said side pieces, a cross-brace uniting said standards at their upper ends, a revoluble shaft mounted on said standards provided with a crank-handle for operating said shaft, a pawl and ratchet arranged to prevent unintentional reverse motion of said shaft, a second shaft mounted between said standards below said revoluble shaft, a pair of pulleys slidably mounted on said second shaft, a pair of ropes wound on said revoluble shaft arranged to pass around said pulleys, and a hook to unite the ends of said ropes substantially as shown and described.

813,647. **PROCESS OF PREPARING SOLUBLE STARCH.** AUGUST F. J. S. HAAKE and HENRICH A. R. A. HAAKE, Hamburg, Germany. Filed Feb. 3, 1903. Serial No. 141,763.

Claim.—1. The herein-described process of preparing a soluble starch consisting in mixing common starch in what is commonly termed its "dry" state in which about twenty per cent. of water is contained therein with dry hypochlorite of lime, substantially as described.

2. The herein-described process of preparing a soluble starch consisting in mixing common starch and hypochlorite of lime with sodium-hydrogen carbonate, all to be mixed in a dry condition, the dryness of the starch being that commonly referred to when the starch contains approximately about twenty per cent. of water substantially as described.

813,648. **ENDLESS PROPELLER FOR BOATS.** GEORGE K. HORTON, San Diego, Cal., assignor of one-half to Edgar L. Nicholson, Seattle, Wash. Filed Apr. 12, 1905. Serial No. 255,486.

Claim.—1. In combination with a vessel, a raceway, an endless propeller arranged for travel upon the raceway, said propeller embodying a plurality of chains, rollers mounted between the chains to reduce the friction between the chains and the raceway, and paddles carried by the chains aforesaid.

2. In combination with a vessel, a raceway, an endless propeller arranged to travel upon the raceway and embodying a plurality of

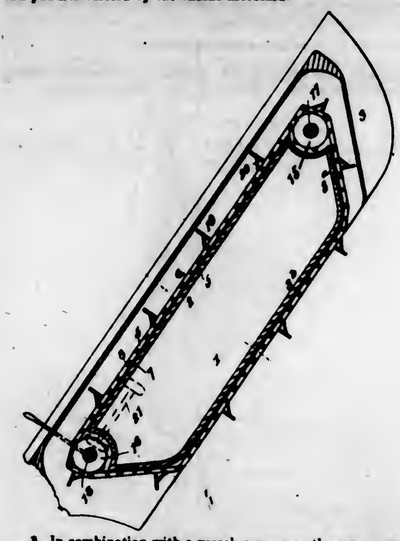
chains, each chain including a plurality of links, rollers mounted in the links to reduce friction between the raceway and the propeller, and paddles carried by the chains aforesaid.

tion of a perforated cap, a cover hinged thereto and adapted to cover the perforations therein and a pad of absorbent material interposed between it and the top of the cup when the cover is closed.

the other radial guides, a train of gearing adapted to operate between said two cooperating elements for causing their relative rotation, said

wires and anchored at their lower ends to the wire which connects the eyes of the wire B, and a fabric covering for said wires with ruffles

chains, each chain including a plurality of links, rollers mounted in the links to reduce friction between the raceway and the propeller, and paddles carried by the chains aforesaid.



3. In combination with a vessel, a raceway thereon, an endless propeller arranged to travel upon the raceway, said propeller comprising a plurality of chains composed of links, pintle-rods connecting adjacent links of each chain and adjacent chains, paddles carried by the chains aforesaid, and rollers carried by individual links of the several chains.

4. In combination with a vessel, a raceway thereon, an endless propeller arranged to travel upon the raceway, flanges at opposite sides of the raceway, the propeller embodying a plurality of endless chains, paddles carried by the chains, antifriction-bearings between the chains and the flanges of the raceway, and antifriction-rollers supported by the propeller between the chains thereof.

5. In combination with a vessel, a raceway thereon, an endless propeller arranged to travel upon the raceway, flanges at opposite sides of the raceway, the propeller embodying a plurality of endless chains, paddles carried by the chains, antifriction-bearings between the chains and the flanges of the raceway, and other antifriction-bearings between the chains and the bed or body of the raceway.

6. In combination with a vessel, a raceway thereon, flanges at opposite sides of the raceway, an endless propeller arranged to travel upon the raceway and composed of a plurality of chains, pintle-rods connecting adjacent links of the chains and also connecting adjacent chains, antifriction-bearings carried by the pintle-rods between adjacent chains to reduce friction between the propeller and the raceway, and other antifriction-bearings between the pintle-rods and the flanges of the raceway.

7. In combination with a vessel, a raceway thereon, an endless propeller arranged to travel upon the raceway, said propeller comprising a chain, flanges at opposite sides of the raceway, and guide members carried by the chain of the propeller and engaging over the flanges of the raceway.

8. In combination with a vessel, a raceway thereon, an endless propeller arranged to travel upon the raceway, said propeller comprising a plurality of chains, flanges at opposite sides of the raceway, and guide members projected from links of the outer chains of the propeller and engaging over the flanges of the raceway.

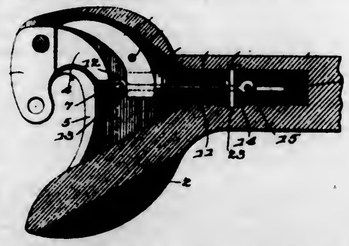
9. In combination with a vessel, a raceway thereon, an endless propeller arranged to travel upon the raceway, said propeller comprising a plurality of chains, flanges at opposite sides of the raceway, guide members projected from links of the outer chains of the propeller and engaging over the flanges of the raceway, and roller-bearings between the guide members and the flanges.

818,649. CONTINENT-HOLDER. DORA JONES, New York, N. Y. Filed Aug. 30, 1905. Serial No. 276,324.

Claim.—1. In a holder of the character described, the combination of a perforated cap, a cover hinged thereto and adapted to cover the perforations therein and a pad of absorbent material interposed between it and the top of the cap when the cover is closed.

2. In a holder of the character described, the combination of a perforated cap, a cover hinged thereto, a pad of absorbent material detachably secured within a shouldered recess in the lower side of the cover, and a spring adapted to keep the cover normally closed over the perforations in the cap.

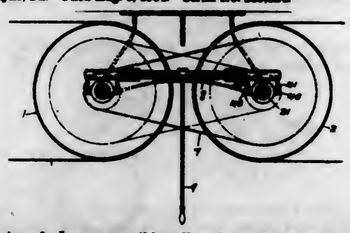
818,650. CAR-COUPLING. ALONZO KELLY, Harrisburg, Pa., assignor of one-fourth to Francis R. Scott, one-fourth to William H. Joyce, and one-fourth to Joseph C. Smith, Harrisburg, Pa. Filed Nov. 18, 1905. Serial No. 288,008.



Claim.—1. A car-coupler having a pivotal knuckle provided with a tailpiece, a locking-lever engaging the free end of the tailpiece and locking the knuckle, an endwise-movable rod connected to the lever, an abutment slidably pierced by the rod, a pivotal kicker slidably pierced by the rod with its outer end in coöperative relation with the pivotal knuckle, and a spring embracing the rod and bearing against the abutment and the kicker to yieldably hold the latter in its normal position, there being a space between the lever and the kicker to permit rearward movement of the lever out of engagement with the tailpiece before engaging the kicker.

2. A car-coupler having a pivotal knuckle provided with a tailpiece, a locking-lever engaging the free end of the tailpiece or locking the knuckle, an endwise-movable rod connected to the lever, an abutment slidably pierced by the rod, a pivotal kicker slidably pierced by the rod with its outer end in coöperative relation with the pivotal knuckle, a shoulder fixed upon the rod in rear of the kicker, and a spring bearing against the abutment and the shoulder to yieldably maintain the latter against the kicker, there being a space between the lever and the kicker to permit rearward movement of the lever out of engagement with the tailpiece before engaging the kicker.

818,651. SPEED-VARYING MECHANISM. JAMES B. LAIRD, Wayne, Pa. Filed Aug. 8, 1904. Serial No. 219,894.



Claim.—1. In an expansible pulley, the combination of a pair of coöperating independently-rotatable elements, one having spiral and the other radial guides, a train of gearing adapted to operate between said two coöperating elements for causing their relative rotation, said gearing including means for automatically increasing the ratio between the rates of movement of said elements, and movable rim-sections having operative relationship each with a radial and a spiral guide.

2. In an expansible pulley, the combination of a pair of coöperating independently-rotatable elements, one having spiral and the other radial guides, a train of gearing adapted to operate between said two coöperating elements for causing their relative rotation, said gearing including a pair of spiral gear-wheels for increasing the ratio between the rates of movement of said elements, and movable rim-sections having operative relationship each with a radial and a spiral guide.

3. In an expansible pulley, the combination of a plurality of radially-movable face-forming sections, and means for causing the movement of the same, comprising two concentric independently-rotatable elements and a shaft for supporting the same, one element provided with spiral guides, the other with radial guides, train of gearing for actuating said elements relatively, said gear means including a pair of spiral gear-wheels for increasing the ratio between the rates of movement of said elements.

4. In an expansible pulley, the combination of a plurality of radially-movable face-forming sections, means for causing the movement of the same comprising two concentric independently-rotatable elements and a shaft for supporting the same, one element provided with spiral guides, the other with radial guides, a trian of gearing for causing the relatively independent rotation of said two elements, said gearing including a pair of spiral gears for increasing the ratio between the rates of movement of said elements.

5. In an expansible wheel or pulley, the combination of a plurality of radially-movable face-forming sections and means for causing the movement of the same, comprising two concentric independently-rotatable elements, one provided with spiral guides and the other with radial guides, a shaft for supporting said rotatable elements, a train of gearing for causing the relatively independent rotation of said elements, and manually-operative means for arbitrarily reversing the direction of said rotation, said gearing including a pair of spiral gears for increasing the ratio between the rates of movement of the scroll element and the shaft-driving the pulley.

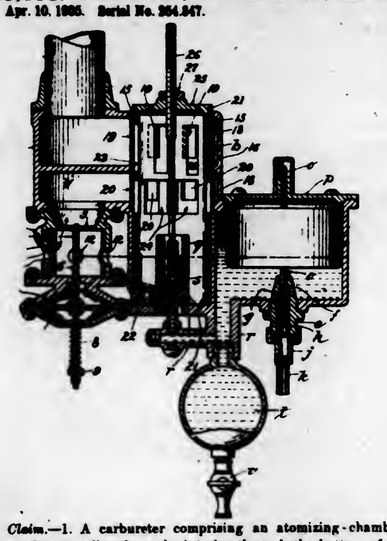
6. In a speed-varying mechanism, a pair of expansible pulleys, each comprising a plurality of radially-movable face-forming sections, and means for causing the movement of the same, comprising two concentric independently-rotatable elements and a shaft for supporting the same, one element provided with spiral guides, the other with radial guides, a train of gearing for actuating said elements relatively, said gearing including a pair of spiral gear-wheels for increasing the ratio between the rates of movement of said elements.

7. In a speed-varying mechanism, a pair of expansible pulleys, each comprising a plurality of radially-movable face-forming sections, and means for causing the movement of the same, comprising two concentric independently-rotatable elements and a shaft for supporting the same, one element provided with spiral guides, the other with radial guides, a train of gearing for actuating said elements relatively, said gearing including a pair of spiral gear-wheels for increasing the ratio between the rates of movement of said elements, and throw-out mechanism for automatically rendering inoperative the gear-actuating means.

818,652. DRESS-FORM. CHARLES LAUFMAN, Arcanville, Ill. Filed Aug. 30, 1905. Serial No. 276,436.

Claim.—In combination, a pair of protectors each comprising a wire B of substantially inverted-U shape having eyes at its ends, an outwardly-bowed wire having eyes connected to the eyes of said wire B, a series of cross-wires having eyes which are connected to said wire B and spaced apart, said cross-wires being slightly downwardly inclined, binding-wires having eyes at their upper ends connected to the arched portion of said wire B and each twisted about said cross-wires and anchored at their lower ends to the wire which connects the eyes of the wire B, and a fabric covering for said wires with ruffles intermediate the cross-wires, and means for supporting said pair of protectors on the body of the wearer as set forth.

813,658. CARBURETER. FRED A. LAW, Hartford, Conn. Filed Apr. 10, 1905. Serial No. 254,847.



Claim.—1. A carbureter comprising an atomizing-chamber, an air-tube extending from the interior through the bottom of the chamber, a supply-tube for combustible located axially of the air-tube, a shell to fit the interior of the atomizing-chamber, endwise movable therein, there being air-ports through the wall of the chamber below the inner end of the air-tube and normally covered by said shell, the opposite end of the latter being closed: a valve for the supply-tube operable by the movement of said shell to vary the supply of combustible coincidently with the opening of said air-ports, and suitable means to move the shell endwise.

2. In a carbureter, an atomizing-chamber provided with an inlet-opening at one end and an outlet-opening at the other, there being ports in the wall of the chamber communicating with an annular space extending around the chamber in the plane of the outlet and communicating with the latter through one or more of said ports, and there being other ports extending through the wall of the chamber near said inlet-opening; atomizing devices associated with the latter, and a shell to fit the interior of the chamber to normally cover the ports near the other end thereof to register in one position with the ports in communication with the outlet-opening; a valve for the atomizing device connected with the shell, and means to move the shell rotatably to adjust the area of the ports at one end of the chamber and vertically to operate the valve and to cover and uncover the ports at the opposite end of the chamber coincidently with the actuation of the valve.

3. In a carbureter, an atomizing-chamber provided with an inlet-opening at one end and an outlet-opening at the other, atomizing devices located at the inlet-opening, the opposite end of said chamber being provided with two annular circumferentially-disposed spaces located in different planes and communicating with the interior of the chamber by suitable ports, one of said spaces through said ports being in communication with the outlet-opening, and the other of said spaces being in communication through its ports with a closed chamber; an inwardly-opening valve in said closed chamber; a rotatable and endwise-movable shell to fit the atomizing-chamber and provided with ports to register with the ports communicating with said annular spaces; a valve on said shell, and means to rotate the latter and to simultaneously impart endwise movement thereto.

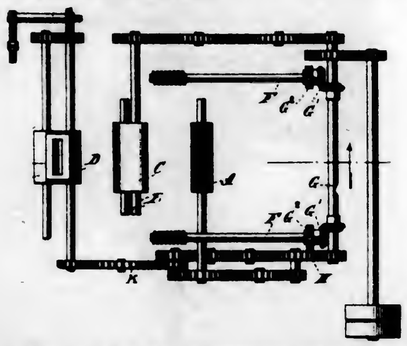
4. In a carburetor, an atomizing-chamber, a second chamber communicating therewith through ports in the contiguous walls of said chambers located in different planes, said second chamber being divided into two compartments one of which has a pipe connection to extend to the motor: a valve in the other compartment opening in-

wardly; a rotatable shell in the atomizing-chamber having ports to

2. A horseshoe and a horseshoe-calk provided with alined bol-

wardly; a rotatable shell in the atomizing-chamber having ports to register with the ports through which communication is established with the connection extending to the meter; suitable atomizing devices connected with the atomizing-chamber located at the inlet-opening therein there being ports through the wall of the atomizing-chamber near the inlet-opening and normally covered by the shell; a valve connected with the shell to control the supply of combustible delivered by the atomizing devices, and means to move the shell to simultaneously vary the area of the ports leading to the motor connection, and to vary the supply of combustible delivered from the atomizing devices and to coincidently uncover the ports near said inlet-opening without varying the area of the ports communicating with the valve-containing compartment.

813,654. GILL-BOX. WILLIAM A. LEE, Jr., New York, N. Y. Filed May 3, 1905. Serial No. 258,737.



Claim.—1. In a gill-box, the combination, with the back rolls, the front rolls, and the press-rolls arranged to take up the material after its passage between the front rolls, of connections for driving the press-rolls and the back rolls, a separate connection for driving the front rolls, so that a variation in the speed of the front rolls will not affect the speed of the press-rolls, and a knock-off motion governed by the number of revolutions of the press-rolls.

2. In a gill-box, the combination, with the back rolls, the front rolls, the apron passing between the front rolls, and smooth press-rolls arranged to take up the material after its passage between the front rolls, of connections for driving the press-rolls and the back rolls, and a separate connection for driving the front rolls, so that the variation in the speed of the front rolls will not affect the speed of the press-rolls.

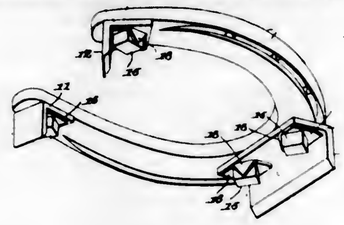
3. In a gill-box, the combination, with the back rolls, the front rolls, the apron passing between the front rolls, and the press-rolls arranged to take up the material after its passage between the front rolls, of connections for driving the press-rolls and the back rolls, a separate connection for driving the front rolls, so that the variation in the speed of the front rolls will not affect the speed of the press-rolls, and a knock-off motion governed by the number of revolutions of the press-rolls.

4. In a gill-box, the combination, with the back rolls, the front rolls, the apron passing between the front rolls, and the smooth press-rolls arranged to take up the material after its passage between the front rolls, of connections for driving the press-rolls and the back rolls, and a separate connection for driving the front rolls, so that a variation in the speed of the front rolls will not affect the speed of the press-rolls.

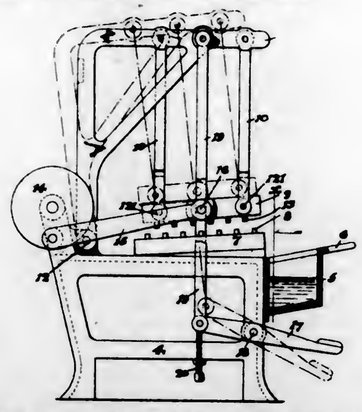
813,655. HORSESHOE-CALK AND FASTENER. WILLARD O. LOSS, Mansfield, Ohio. Filed Aug. 26, 1905. Serial No. 275,320.

Claim.—1. A horseshoe and a horseshoe-calk provided with alined bolt-apertures and a projection extending from said calk, a locking-plate bearing against said calk and provided with an intermediate bolt-aperture, the material at one side of the aperture in said plate being of greater distance than the distance between the aperture in said calk and the projection on the same, and a bolt engaging said apertures and bearing by its head against said locking-plate and bending the excess material therein against the projection, the plate being thereby caused to exert a pressure transversely of the bolt and likewise outwardly against the head of the same.

2. A horseshoe and a horseshoe-calk provided with alined bolt-apertures and a projection extending from said calk, a locking-plate bearing against said calk and provided with an intermediate bolt-aperture, the material at one side of the aperture in said plate being of greater distance than the distance between the aperture in said calk and the projection on the same, and a bolt engaging said apertures and bearing by its head against said locking-plate and bending the excess material therein against the projection, and the head further secured by bending the free end of the plate over the same.



813,656. HAT-SIZING MACHINE. WILLIAM H. LYONS, West Orange, N. J. Filed July 24, 1905. Serial No. 270,968.



Claim.—1. In a hat-sizing machine, the combination of a tank, a rubbing-board outside of said tank, a second rubbing-board parallel with the first said rubbing-board and above the same, a suspensory frame having an extension above said rubbing-boards, parallel rods connecting the second rubbing-board to said suspensory frame, and means for reciprocating the upper rubbing-board, substantially as set forth.

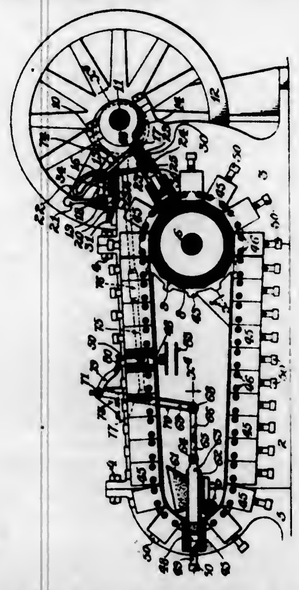
2. In a hat-sizing machine, the combination of a tank, a rubbing-board rearward of said tank and above the same, a second rubbing-board above the first said rubbing-board, a pivoted suspensory frame, rods connecting the second rubbing-board to said frame, means for reciprocating the second rubbing-board, and a pedal for raising the second rubbing-board with its suspensory frame from the first, substantially as set forth.

3. The combination with the bed, having pivotal bearings near the back thereof, and a frame extending upward from the said pivotal bearings and having at the top thereof, a forwardly-projecting suspensory extension, rods pivoted upon the said forward extension, a rubbing-board carried by said rods, and a lower rubbing-board seated beneath the upper rubbing-board upon the bed, an eccentric or crank wheel, and connections of said crank-wheel with the upper rubbing-board.

4. The combination with the bed, having pivotal bearings near the back thereof, and a frame extending upward from said pivotal bearings and having at the top thereof, a forwardly-projecting suspensory extension, rods pivoted upon the said forward extension, a rubbing-board carried by said rods, and a lower rubbing-board seated beneath the upper rubbing-board upon the bed, an eccentric or crank wheel, and connections of said crank-wheel with the upper rubbing-board, a screw limiting a downward movement of the upper rubbing-board, and a pedal and connections of said pedal with the pivoted frame.

5. The improved hat-sizing machine herein described, comprising a bed having a tank at the front, and back of, and a little above said tank, having an approximately horizontal rubbing-board, a frame pivoted at the rear of said bed and extending upwardly and forwardly therefrom, a pedal and a rod connecting said pedal with the forward extension of said frame, a reciprocating rubbing-board and suspensory rods for the same, a crank-wheel and connecting-rod of said wheel and reciprocating rubbing-board, substantially as set forth.

813,657. BRIQUET-MACHINE. HOWARD B. MARSH, Los Angeles, Cal., assignor of one-half to William P. Wagy, Los Angeles, Cal. Filed Mar. 13, 1905. Serial No. 249,761.



Claim.—1. In a briquet-machine comprising a series of disconnected mold-blocks, means for supporting the mold-blocks and guiding them in an orbit, the upper and lower runs of the orbit being inclined downwardly in the direction in which the blocks travel, and means for directly lifting the mold-blocks from the lower run to the upper run.

2. In a briquet-machine, a series of mold-blocks, means for feeding material to the mold-blocks, and means for compressing the material within the mold-blocks embracing a throw-out mechanism bodily movable into or out of the pressure-line.

3. In a briquet-machine, a series of disconnected mold-blocks, means for supporting the mold-blocks and guiding them downwardly through a portion of their orbit, and means for lifting the mold-blocks from the lower end to the upper end of such portion.

4. In a briquet-machine, a molding-drum, a series of mold-blocks, means for supporting and guiding said mold-blocks in an orbit over said molding-drum, means including a stop-motion cam for intermittently rotating the molding-drum and advancing the mold-blocks through the orbit.

5. In a briquet-machine, a series of mold-blocks each having a molding-cavity, a plunger in said cavity for compressing the briquet, means for coacting with the plungers consecutively and operating them and means for axially turning each plunger during its compression of the briquet.

6. In a briquet-machine, a mold-block having a molding-cavity, a plunger therein, means for imparting a combined longitudinal and axial movement to the plunger for compressing the briquet, and means for imparting a rectilineal movement only to the plunger while expelling the briquet from the mold-block.

7. In a briquet-machine, a series of mold-blocks, means for supporting and guiding the same in an orbit, a molding-drum coacting with the mold-blocks, and means for intermittently bearing directly against the molding-drum to hold the molding-drum rigid during the compression of each briquet.

8. In a briquet-machine, means provided with a face against which a briquet is pressed, a mold-block movable into conjunction with said face, and within which the briquet is formed, a plunger in the mold-block, and resilient means for operating the plunger, and means for moving the resilient means bodily out of the pressure-line.

9. In a briquet-machine, means for compressing a briquet comprising a collapsible device, the working tension of which does not exceed the pressure to be imparted to the briquet, and means for moving the collapsible device bodily out of the pressure-line.

10. In a briquet-machine, means for compressing a briquet comprising a compressible element, the resistance of said compressible element being not greater than the resistance afforded thereto by the briquet when compressed to a definite degree, and means for moving the compressible element bodily out of the pressure-line.

11. In a briquet-machine, a series of disconnected mold-blocks, means for guiding the mold-blocks downwardly through a portion of their orbit, and a molding-drum arranged to lift the blocks from the lower end to the upper end of said portion.

12. In a briquet-machine, a series of mold-blocks, means for advancing the mold-blocks step by step through an orbit, a hopper having a tubular extension, a plunger in said extension for pushing material from the hopper into a mold-block, an intermediate shaft, pendent arms on said shaft, a connection from the plunger to the pendent arms, a main shaft, an eccentric thereon, and a rod connecting the eccentric with a pendent arm.

13. In a briquet-machine, a series of mold-blocks, means for advancing the mold-blocks step by step through an orbit, a hopper having a tubular extension, a plunger in said extension for pushing material from the hopper into a mold-block, an intermediate shaft, pendent arms on said shaft, a connection from the plunger to the pendent arms, a main shaft, an eccentric thereon, a rod connecting the eccentric with a pendent arm, and means for attaching the eccentric-rod at various points on the pendent arm to adjust the stroke of said plunger.

14. In a briquet-machine, a base having side frames each of which has an ovoidal groove, the upper run of the grooves being inclined in one direction from the horizontal, and the lower run of the grooves being oppositely inclined, a series of disconnected mold-blocks, and means on the mold-blocks projecting into the grooves for supporting the mold-blocks.

15. In a briquet-machine, a base with side frames, each side frame having an ovoidal groove, the upper run of the grooves being inclined in one direction from the horizontal, and the lower run of the grooves being oppositely inclined, a series of disconnected mold-blocks between the side frames and a pair of pins on each end of each mold-block projecting into the adjacent groove.

16. In a briquet-machine, a base having side frames each of which has an ovoidal groove, the upper run of the grooves being inclined in one direction from the horizontal, and the lower run of the grooves being oppositely inclined, a series of disconnected mold-blocks, means on the mold-blocks projecting into the grooves for supporting the mold-blocks, and means for elevating the mold-blocks from the lower run to the upper run of the grooves.

17. In a briquet-machine, a base with side frames, each side frame having an ovoidal groove, the upper run of the grooves being inclined in one direction from the horizontal, and the lower run of the grooves being oppositely inclined, a series of disconnected mold-blocks between the side frames, a pair of pins on each end of each mold-block projecting into the adjacent groove, and a molding-drum having lugs for engaging said pins to lift the mold-blocks from the lower run to the upper run of said grooves.

18. In a briquet-machine, a series of mold-blocks, means for supporting and guiding the mold-blocks through an orbit, plungers in the mold-blocks having stems, a main shaft, a cam carried thereby, and a throw-out mechanism between said cam and the path of the mold-blocks.

19. In a briquet-machine, a series of mold-blocks, means for supporting and guiding the mold-blocks through an orbit, plungers in the mold-blocks having stems, a main shaft, a cam carried thereby, a throw-out mechanism between said cam and the path of the mold-blocks, the throw-out mechanism comprising a pivoted spring-buffer, a pivoted plunger-buffer, and a spring between the two buffers.

20. In a briquet-machine, a series of mold-blocks, means for supporting and guiding the mold-blocks through an orbit, plungers in the mold-blocks having stems, a main shaft, a cam carried thereby,

a throw-out mechanism between said cam and the path of the mold-blocks, the throw-out mechanism comprising a pivoted spring-buffer, by the yoke, the ends of which are guided by the slotted brackets, a spring-buffer mounted on the shaft, a plunger-buffer mounted on the

2. In a crucible-shaker, the combination with a base-plate upon od terminal, an intermediate transverse aperture and a central lon-

a throw-out mechanism between said cam and the path of the mold-blocks, the throw-out mechanism comprising a pivoted spring-buffer, a pivoted plunger-buffer, a spring between the two buffers, and a thrust-bearing carried by the plunger-buffer for working against the stem of the plunger.

21. In a briquet-machine, a series of mold-blocks movable through an orbit, a shaft, a cam on the shaft, a throw-out mechanism between the cam and path of the mold-blocks comprising a pivoted spring-buffer, a plunger-buffer pivoted concentric with the spring-buffer, a spring between the two buffers, and means for lifting said buffers.

22. A series of mold-blocks movable through an orbit, a shaft, a cam on the shaft, a throw-out mechanism between the cam and the path of the mold-blocks comprising a rock-shaft, a yoke carried by said rock-shaft, a hand-lever for operating said rock-shaft, a spring-buffer pivoted to said yoke and working against said cam, a plunger-buffer pivoted to said yoke, and a spring between the two buffers.

23. A series of mold-blocks movable through an orbit, a shaft, a cam on the shaft, a throw-out mechanism between the cam and the path of the mold-blocks comprising a rock-shaft, a yoke carried by said rock-shaft, a hand-lever for operating said rock-shaft, a spring-buffer pivoted to said yoke and working against said cam, a plunger-buffer pivoted to said yoke, a spring between the two buffers, and means for yieldingly holding said buffers in substantially constant relation to said yoke irrespective of the position of the yoke.

24. A series of mold-blocks movable through an orbit, a shaft, a cam on the shaft, a throw-out mechanism between the cam and the path of the mold-blocks comprising a rock-shaft, a yoke carried by said rock-shaft, a hand-lever for operating said rock-shaft, a spring-buffer pivoted to said yoke and working against said cam, a plunger-buffer pivoted to said yoke, a spring between the two buffers, an arm depending from said yoke and having a stud, a stud on the plunger-buffer, and a spring supported by said studs between said arm and the plunger-buffer.

25. In a briquet-machine, a base with side frames, a series of mold-blocks movable in an orbit, means on the said frames for supporting the mold-blocks, a molding-drum having working faces over which the mold-blocks pass, a slide mounted in each side frame adjacent the molding-drum, a head on each slide for pressing against the working face of the molding-drum, and means for pressing said slide toward the drum to force the heads against the working faces of the molding-drum.

26. In a briquet-machine, a base with side frames, a series of mold-blocks supported by the side frames, a molding-drum having working faces with which the mold-blocks coact, means for intermittently rotating the molding-drum and moving the mold-blocks, a slide on each side frame adjacent the molding-drum, a head on each slide, and means for forcing the slides toward the molding-drum while the latter is stationary between successive steps to force the heads against the adjacent working faces of the molding-drum.

27. In a briquet-machine, a base with side frames, a series of mold-blocks supported by the side frames, a molding-drum having working faces with which the mold-blocks coact, means for intermittently rotating the molding-drum and moving the mold-blocks, a slide on each side frame adjacent the molding-drum, a head on each slide, a main shaft carried by the side frame, cams on the shaft, a roller carried by each slide and working against its respective cam.

28. In a briquet-machine, a series of mold-blocks movable through an orbit, plungers in the mold-blocks, a rotating cam, a throw-out mechanism between the cam and a plunger for operating the same comprising a rock-shaft, a yoke on the rock-shaft, a hand-lever for operating the yoke, slotted guide-brackets, a shaft carried by the yoke, the ends of which are guided by the slotted brackets, a spring-buffer mounted on the shaft, a plunger-buffer mounted on the shaft, and a spring between the two buffers.

29. In a briquet-machine, a series of mold-blocks movable through an orbit, plungers in the mold-blocks, a rotating cam, a throw-out mechanism between the cam and a plunger for operating the same comprising a rock-shaft, a yoke on the rock-shaft, a hand-lever for operating the yoke, slotted guide-brackets, a shaft carried by the yoke, the ends of which are guided by the slotted brackets, a spring-buffer mounted on the shaft, a plunger-buffer mounted on the shaft, a spring between the two buffers, an arm carried by the yoke, a stud on the arm, a stud on the plunger-buffer, and a spring supported by said studs between said arm and the plunger-buffer.

30. In a briquet-machine, a series of mold-blocks movable through an orbit, plungers in the mold-blocks, a rotating cam, a throw-out mechanism between the cam and a plunger for operating the same comprising a rock-shaft, a yoke on the rock-shaft, a hand-lever for operating the yoke, slotted guide-brackets, a shaft carried by the yoke, the ends of which are guided by the slotted brackets, a spring-buffer mounted on the shaft, a plunger-buffer mounted on the shaft, a spring between the two buffers, an arm carried by the yoke, a stud on the arm, a stud on the plunger-buffer, a spring supported by said studs between said arm and the plunger-buffer, a head revolubly mounted on the plunger-buffer, and a series of balls between the head and buffer.

31. In a briquet-machine, a series of mold-blocks movable through an orbit, a shaft, pins on each mold-block, and means operated by the shaft and engaging the pins for imparting an intermittent movement to the same.

32. In a briquet-machine, a series of mold-blocks movable through an orbit, and having flat faces, a molding-drum provided with flat faces for coacting with the flat faces of the mold-blocks and means intermittently movable toward the molding-drum and bearing against the flat faces in consecutive order for holding the molding-drum rigidly stationary.

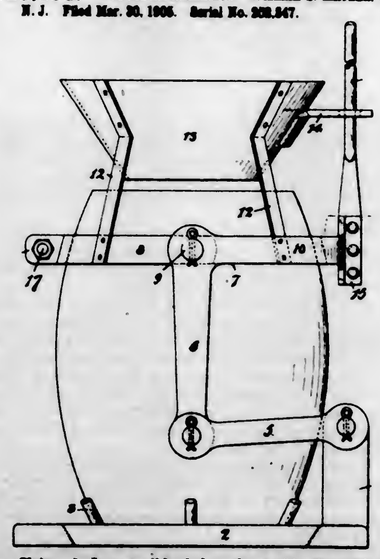
33. In a briquet-machine, a series of mold-blocks movable through an orbit, a shaft, pins on each mold-block, means operated by the shaft and engaging the pins for imparting an intermittent movement to the same, and means for intermittently operating the molding-drum to impart a step-by-step movement to the mold-blocks.

34. In a briquet-machine, a series of mold-blocks movable through an orbit, pins on the ends of the mold-blocks, a molding-drum having bosses for engaging said pins, and means for moving said molding-drum whereby the mold-blocks are moved by the pins coacting with the bosses.

35. In a briquet-machine, a base with side frames, each side frame having a groove, a series of mold-blocks, a pair of pins on each end of each mold-block projecting into the adjacent groove in the said frame, a molding-drum over which the mold-blocks pass and means operated by the molding-drum for causing the mold-blocks to travel along said grooves.

36. A briquet-machine comprising a series of disconnected mold-blocks, means for supporting the mold-blocks and guiding them in an orbit, said means comprising studs projecting from said mold-blocks and a slotted support in which said studs travel, the upper and lower runs of the orbit being inclined downwardly in the direction in which the blocks travel, and means for directly lifting the mold-blocks from the lower run to the upper run.

813,658. **CRUCIBLE-SHAKER.** WILLIAM S. MATHER, Newark, N. J. Filed Mar. 30, 1905. Serial No. 253,547.



Claim.—1. In a crucible-shaker, the combination with a base-plate having standards thereon, of a ring adapted to fit over the top of a crucible, a semicircular shaking-band pivoted at its ends to said ring, downward extensions upon said ends of the shaking-band, links connecting said extensions to the standards, and a lever upon said band.

2. In a crucible-shaker, the combination with a base-plate upon which a crucible may stand, of a ring adapted to fit over the top of the crucible, a funnel supported on said shaking-ring, a semicircular shaking-band pivoted to said ring at diametrically opposite points thereof, arms extending downward from said shaking-band and being pivotally connected to the base-plate, and a lever or handle upon said shaking-band midway between its extremities and secured to said funnel.

3. In a crucible-shaker, the combination with a base-plate having at the opposite ends of its rear edge upright standards, a ring adapted to fit over the top of the crucible, a semicircular shaking-band pivoted at its ends to opposite points of said ring, an upwardly-extending lever or handle upon said band, arms extending downward from the pivotal points of said shaking-band, and substantially horizontal links connecting said arms with the said standards on the base-plate.

4. In a crucible-shaker a base-plate for a crucible to stand upon, a shaking-ring adapted to fit over the top of the crucible, a curved shaking-band pivoted at its ends to said ring, downward extensions from said ends adapted to be pivotally connected to the said base-plate, and a lever or handle upon said shaking-band.

5. In a crucible-shaker, a base-plate for a crucible to stand upon, a shaking-ring adapted to fit over the top of the crucible, a funnel supported upon said ring above the top of a crucible, and handle means pivoted to said ring, connected to the funnel and fulcrumed to the said base-plate.

6. In a crucible-shaker, supporting means for the base of a crucible, a ring adapted to fit over the top of the crucible, a curved shaking-band pivoted at its ends to opposite points of said ring and being extended beyond said points of pivoting to fulcrumally engage the said crucible-supporting means, a funnel supported upon said ring, a slotted arm upon said funnel, and a lever or handle upon said shaking-band extending through the slot of said arm.

7. In a crucible-shaker, base-supporting means for a crucible, a ring adapted to fit over the top of the crucible, a curved shaking-band pivoted at its ends to opposite points of said ring and being extended beyond said points, links connecting said extensions to the said crucible-support, a handle or lever at the upper side of the said shaking-band, and a projection 15 at the opposite side of said shaking-band from said lever or handle.

8. In a crucible-shaker, a base-support for the crucible to stand upon, a shaking-ring adapted to fit over the top of the crucible, handle means pivoted to said shaking-ring and having downward extensions, and links pivotally connecting said extensions to the base-support and normally forming with said extensions angles whereby the ring may be raised and lowered without detachment from the base-support.

9. In a crucible-shaker, a base-support for the crucible to stand upon, a shaking-ring adapted to fit over the top of the crucible, handle means pivoted to said shaking-ring, and having downward extensions and links connecting said extensions to the base-support while permitting the shaking-ring to be raised and lowered with respect thereto.

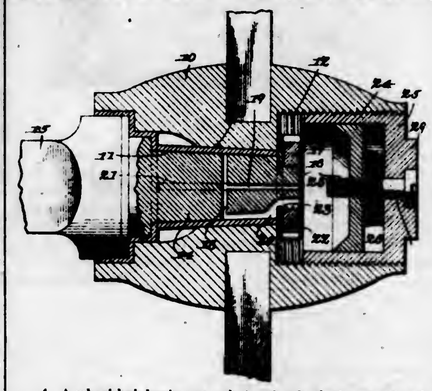
10. In a crucible-shaker, the combination of a base-support for a crucible to stand upon, a shaking-ring adapted to fit over the top of the crucible, a band connected at its ends to said ring and having downward extensions from said ends, links connecting said extensions to the base-support, and a handle.

813,659. **WHEEL-HUB.** SILAS P. MILLS, Garfield, Kans. Filed June 30, 1905. Serial No. 267,707.

Claim.—1. A wheel-hub having an axle-bearing in the inner end and an internally-threaded cavity in the outer end communicating with said bearing, an axle-spindle engaging said bearing and having a threaded terminal, an axle-nut engaging the threaded end of said spindle and bearing against the hub in the bottom of said cavity, a threaded cylindrical member closed at the outer end and engaging said cavity, a plunger operating in said cylinder, and means for moving said plunger longitudinally of said cylinder.

2. A wheel-hub having an axle-bearing in the inner end and an internally-threaded cavity in the outer end communicating with said bearing, an axle-spindle engaging said bearing and having a threaded terminal, and with an intermediate transverse aperture and a central longitudinal aperture leading inwardly from the outer end and intersecting said transverse aperture.

3. A wheel-hub having an axle-bearing in the inner end and an internally-threaded cavity in the outer end communicating with said bearing, an axle-spindle engaging said bearing and having a threaded terminal, an intermediate transverse aperture and a central longitudinal aperture leading inwardly from the outer end and intersecting the transverse aperture and a longitudinal channel connecting one of the outer ends of said transverse aperture with said cavity.



4. A wheel-hub having an axle-bearing in the inner end and an internally-threaded cavity in the outer end communicating with said bearing, an axle-spindle engaging said bearing and having a threaded terminal, an axle-nut engaging the threaded end of said spindle and bearing against the hub in the bottom of said cavity, a threaded cylindrical member closed at the outer end and engaging said cavity, a plunger operating in said cylinder, and a bolt rotative through the closed end of said cylindrical member and engaging said plunger by its threaded end.

5. A wheel-hub having an axle-bearing in the inner end and an internally-threaded cavity in the outer end communicating with said bearing, an axle-spindle engaging said bearing and having a threaded terminal, an axle-nut engaging the threaded end of said spindle and bearing against the hub in the bottom of said cavity, a threaded cylindrical member closed at the outer end and engaging said cavity, a plunger operating in said cylinder, a bolt rotative through said cylindrical member and engaging said plunger by its threaded end, and a spring between said plunger and the outer end of said cylindrical member.

813,660. **LIGHTNING-CONDUCTOR.** THOMAS H. MIMS, Wrens, Mo. Filed May 1, 1905. Serial No. 258,223.

Claim.—The combination in a lightning-conductor for buildings, of a plurality of main conducting-wires twisted together intermediate their ends and the twisted portion being located at a central point on the roof of the building and disposed vertically and provided with an attracting-point, the said main conducting-wires diverging in different directions from the said twisted portion and extending therefrom over the roof of the building and thence downwardly to the ground, and supplemental conducting-wires having their end portions intertwisted with the end portions of the main conducting-wires, from the roof of the building to the ground the intermediate portions of said supplemental conducting-wires extending from one main conducting-wire to an opposite main wire, as and for the purpose set forth

813,661. **BRIQUET-MACHINE.** THOMAS A. MATHER, Orange, N. J. Filed Mar. 30, 1905. Serial No. 253,548.

Claim.—1. The combination with a base-plate, of a ring adapted to fit over the top of a crucible, a semicircular shaking-band pivoted at its ends to said ring, downward extensions upon said ends of the shaking-band, links connecting said extensions to the base-plate, and a lever upon said band.

813,661. DRESSING-BOOTH. THOMAS A. McGUIRE, Oakland, Ill. Filed Oct. 11, 1905. Serial No. 282,255.

Claim.—1. In a dressing-booth, the combination of a support, a curtain suspended from said support and forming the inclosing walls of the booth, a floor-covering for said booth, said floor-covering being pivotally connected to the support so as to swing thereagainst, and means for swinging the floor-covering against the support.

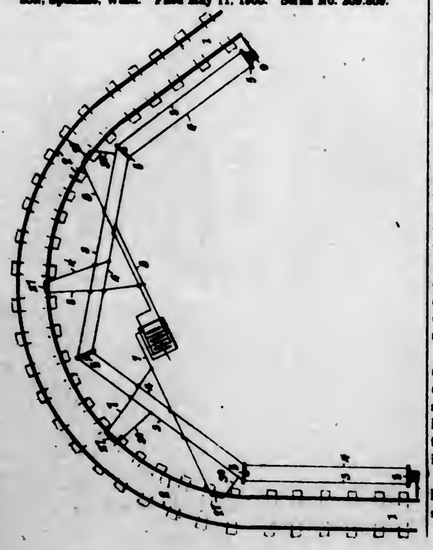
2. In a device of the character described, the combination of a framework pivotally attached to the wall, an inclosing curtain suspended therefrom, a floor-covering pivotally mounted so as to swing up against the wall, and means whereby the framework and the floor-covering can be folded against the wall.

3. In a device of the character described, the combination of an upper framework pivotally connected to the wall, an inclosing curtain suspended therefrom, a lower framework pivotally mounted so as to swing against the wall, a floor-covering stretched across the lower framework, and means whereby the upper and lower frameworks can be folded against the wall.

4. In a device of the character described, the combination of an upper framework pivotally connected to the wall, an inclosing curtain suspended therefrom, a lower framework pivotally mounted so as to swing against the wall, a floor-covering stretched across the lower framework, connecting means between the upper framework and the lower framework to secure a simultaneous movement thereof, and means whereby the two frameworks can be folded against the wall.

5. In a device of the character described, the combination of a standard secured to the wall, an upper framework pivotally attached to the standard, an inclosing curtain suspended from the upper framework, a floor-covering pivotally connected to a lower portion of the standard, and means whereby the two frameworks can be simultaneously folded against the wall.

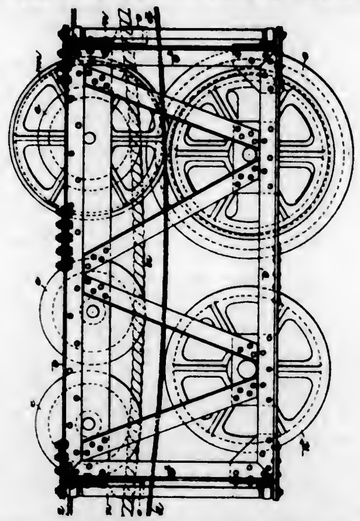
813,662. ELECTRICAL RAILWAY-SIGNAL. AUGUST W. NELSON, Spokane, Wash. Filed May 11, 1905. Serial No. 260,859.



Claim.—1. The combination with an electrical signal and a circuit connected therewith standing normally open, of contacts comprising a base-piece, a yoke slidably disposed in the base-piece, a roller journaled in the yoke in the path of the wheels of a passing car, contact-pieces fixed to the base-pieces and to the yoke, and adapted to contact when the roller and the yoke are depressed.

2. The combination with an electrically-operated signal, and a circuit connected therewith and standing normally open, of contacts comprising a base-piece formed with a vertical sleeve and adapted to be secured to the bottom flange of a rail, a yoke slidably disposed in the said sleeve, a spring to lift and hold the yoke in upper position, a contact-piece secured to the yoke, and connected to the circuit, a contact-piece secured to the said sleeve, and a roller journaled in the yoke in the path of a passing car.

813,663. HOISTING AND CONVEYING APPARATUS. ALBION E. NORRIS, Cambridge, Mass. Filed Dec. 19, 1901. Serial No. 86,497.



Claim.—1. In an apparatus of the class described, a track-cable a trolley thereon, an endless operating-cable connected with said trolley, the outgoing and return strands of said endless operating-cable bearing upon said trolley at opposite sides of the longitudinal center thereof, whereby said strands coöperate with said track-cable in supporting a load carried by said trolley and without tendency to swing the said trolley about said track-cable.

2. In an apparatus of the class described a track-cable, a trolley thereon, endless traverse and hoisting cables connected with said trolley, the tight strands of said traverse and hoisting cables engaging the said trolley at substantially the same distance from and at opposite sides of the longitudinal center of the said trolley and track-cable and the slack strands of said cables likewise engaging said trolley at substantially equal distance from and at opposite sides of said longitudinal center of said trolley and said track-cable, whereby to maintain said trolley always in substantial equilibrium.

3. In an apparatus of the class described, a track-cable, a trolley and its wheels traveling upon said track-cable, and endless hoisting and traverse cables engaging said trolley at opposite sides of the line of said track-cable in a manner substantially as described, to preserve the equilibrium of said trolley.

4. In a cableway apparatus a trolley, operating means at one end of said cableway, separate endless traverse and hoisting ropes each in engagement with said operating means and having each a short strand leading therefrom to said trolley and a long strand leading therefrom to the opposite side of said cableway and thence to said trolley, and slack-adjusting means in the short strand of said hoisting-rope and in the long strand of said traverse-rope.

5. In an apparatus of the class described a trolley and an endless hoist-operating cable therefor in trolley-supporting engagement with said trolley with both its outgoing and return strands.

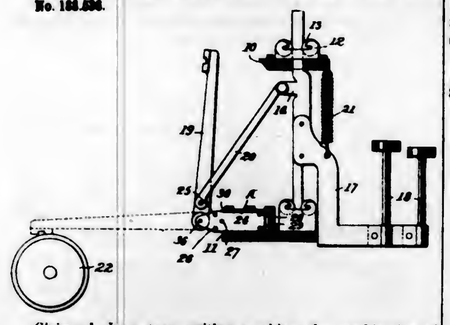
6. In an apparatus of the class described a trolley and an endless operating-cable therefor in trolley-supporting engagement with the trolley at substantially equal distances on either side of the longitudinal center thereof.

7. In an apparatus of the class described a trolley, an endless operating-cable therefor engaging said trolley with both its outgoing and return strands, and means for balancing the effect of said cable upon said trolley to preserve the equilibrium thereof.

8. In an apparatus of the class described a trolley, an endless hoist-operating cable connected through one of its strands with said trolley to control movement of one or more of the trolley parts, and means for causing the other strand of said operating-cable to assist in supporting the trolley-weight.

9. In an apparatus of the class described a trolley, a plurality of endless operating-cables having each their tight and slack strands engaging with said trolley and means for balancing the effect upon said trolley of the tight strand of one cable by the effect of the tight strand of another cable to preserve the equilibrium thereof.

813,664. HANGER FOR TYPE-BARS. WILLIAM H. PIKE, Jr., Orange, N. J., assignor to New York Adding Typewriter Company, Orange, N. J., a Corporation of Missouri. Filed Jan. 11, 1904. Serial No. 188,536.



Claim.—1. In a type-writing machine, the combination of plates, a type-bar having bearings in said plates, and fastenings for securing said plates placed at different distances from said bearings, the whole being so constructed and arranged that tightening the fastening nearer the type-bar bearings operates to tighten said bearings and tightening the fastening more remote from said bearings operates to loosen the bearings, substantially as described.

2. In a type-writing machine, the combination of plates, a type-bar having bearings in said plates, and fastenings for securing said plates so arranged with relation to said bearings that when one of said fastenings is tightened the other will act as a fulcrum on which said plates rock to loosen said bearings, and when the latter fastening is tightened, the former will act as a fulcrum on which said plates rock to tighten said bearings, substantially as described.

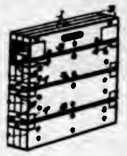
3. In a type-writing machine, the combination of plates, a type-bar having bearings in said plates and shouldered rivets for securing said plates arranged at different distances from said bearings, substantially as described.

4. In a type-writing machine, a type-bar hanger comprising two plates and rivets having shoulders engaging the inner faces of the plates for connecting them in separated relation, said plates having tapered holes near their ends, combined with a type-bar having a hub to fit between said plates and tapered journals projecting from the sides of said hub to fit in said holes, substantially as described.

5. In a type-writing machine, the combination with a type-bar having journals projecting from the sides thereof, of a hanger having side plates provided with bearings for said journals, a pair of rivets connecting said plates adjacent the bearings for the type-bar journals, and a single rivet connecting said plates at a greater distance from the type-bar bearings and in a plane between the aforesaid rivets, substantially as described.

6. In a type-writing machine, the combination with a type-bar having journals projecting from the sides thereof, of a hanger having side plates provided with bearings for said journals, a pair of rivets connecting said plates at points in the same vertical plane, and a single rivet connecting said plates at a point in a horizontal plane between the aforesaid rivet and in a vertical plane more remote from the type-bar bearings than said pair of rivets, substantially as described.

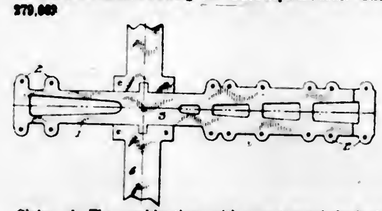
813,665. DIVISION-BLOCK FOR HAY-BALERS. JULIAN H. PIPKIN, Chicago, Ill. Filed Oct. 28, 1905. Serial No. 284,022.



Claim.—1. A division-block for hay-balers consisting of a center board having side boards secured thereto, with transversely-extending grooves between said side boards and reinforcing-plates arranged flush with the edge of said block, said reinforcing-plates having vertically-extending grooves which receive the edges of said center board, and transversely-extending notches which register with the grooves formed between said side boards, substantially as and for the purpose specified.

2. A division-block for hay-balers provided with transversely-extending grooves and having reinforcing-plates arranged flush with the edges of said block, said reinforcing-plates having notches therein registering with the said grooves, and a recess formed above the said notches, substantially as and for the purpose specified.

813,666. DRAFT-RIGGING CARRIER AND BODY-BOLSTER. OSWALD S. PULLIAM, Pittsburg, Pa. Filed Sept. 22, 1905. Serial No. 279,069.



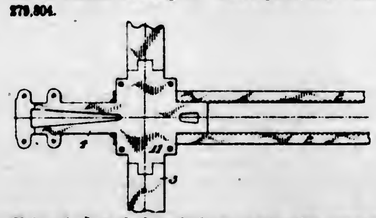
Claim.—1. The combination, with a cast-metal draft-rigging carrier, of a cast-metal body-bolster secured to the carrier, and a truck-bolster center-bearing cast integral with the body-bolster.

2. The combination, with a cast-metal draft-rigging carrier formed with a recess below its top plate, a cast-metal body-bolster secured in said recess, and a truck-bolster center-bearing formed on the body-bolster.

3. The combination, with a cast-metal draft-rigging carrier formed with a recess below its top plate and provided with lugs projecting from the top plate, a cast-metal body-bolster formed with pockets arranged to receive the lugs of the draft-rigging carrier, said body-bolster secured in the recess of the draft-rigging carrier, and a truck-bolster center-bearing formed integral with the body-bolster.

4. The combination, with a cast-metal draft-rigging carrier formed with a recess below its top plate, lugs projecting from the top plate, apertured ears below the projecting lugs, a cast-metal body-bolster formed with pockets to receive the lugs of the carrier and with ears arranged to register with the ears of the carrier, said body-bolster located in the recess of the carrier.

813,667. CAR-BODY UNDERFRAME CONSTRUCTION. OSWALD S. PULLIAM, Pittsburg, Pa. Filed Sept. 23, 1905. Serial No. 279,304.



Claim.—1. A car-body underframe construction comprising a metal center sill, a metal body-bolster formed with a recess to receive the center sill, and a metal draft-rigging carrier interlocked, substantially as set forth.

2. A car-body underframe construction comprising a metal center sill, a metal body-bolster formed with a recess and with lugs arranged to engage the center sill, and a metal draft-rigging carrier, substantially as set forth.

3. A car-body underframe construction comprising a metal body-bolster formed with a recess, a metal center sill extending into the recess, and a metal draft-rigging carrier located in the recess, substantially as set forth.

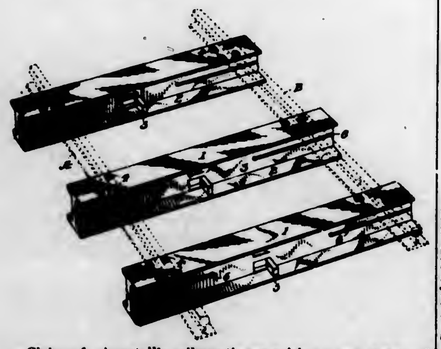
4. A car-body underframe construction comprising a metal body-bolster having a central recess and provided with lugs projecting into the recess, a metal sill in the recess, a filler in the recess, said lugs extending through the sill and adapted to engage the filler, substantially as set forth.

5. A car-body underframe construction comprising a metal body-bolster formed with a recess and provided with lugs projecting into the recess, center sills in the form of channels extending into the recess, a filler in the recess located between the sills, said lugs engaging the sills, substantially as set forth.

6. A car-body underframe construction comprising a metal body-bolster formed with a recess, center sills in the form of channels extending into the recess, and a metal draft-rigging carrier located in the recess between the center sills, substantially as set forth.

7. A car-body underframe construction comprising a metal body-bolster formed with a recess, center sills extending into the recess, a metal draft-rigging carrier extending into the recess between the center sills, said bolster, sills and carrier interlocked, substantially as set forth.

813,668. METALLIC RAILWAY-TIE. OSWALD S. PULLIAM, Pittsburg, Pa. Filed Sept. 23, 1905. Serial No. 279,805.



Claim.—1. A metallic railway-tie comprising a cast structural beam having a vertical web and top and bottom members, and means for giving elasticity to the tie comprising a slot formed in the web, substantially as set forth.

2. A metallic railway-tie comprising a beam having a vertical web and means for giving elasticity to the tie comprising top and bottom members, and a horizontally-disposed slot formed in the web, substantially as set forth.

3. A metallic railway-tie comprising a rolled structural beam having a vertical web and top and bottom members, and means for giving elasticity to the tie comprising a slot formed in the web at each end of the beam, substantially as set forth.

4. A metallic railway-tie comprising a beam having a vertical web and top and bottom members, and means for giving elasticity to the tie comprising a plurality of slots formed in the web, substantially as set forth.

5. A metallic railway-tie comprising a rolled structural I-beam having means for giving elasticity to the tie comprising a horizontally-disposed slot formed in the web thereof, substantially as set forth.

6. A metallic railway-tie comprising a rolled structural I-beam having means for giving elasticity to the tie comprising a horizontally-disposed slot formed in the web at each end of the beam, substantially as set forth.

7. A metallic railway-tie comprising a rolled structural I-beam having means for giving elasticity to the tie comprising a plurality of horizontally-disposed slots formed in the web of the beam, substantially as set forth.

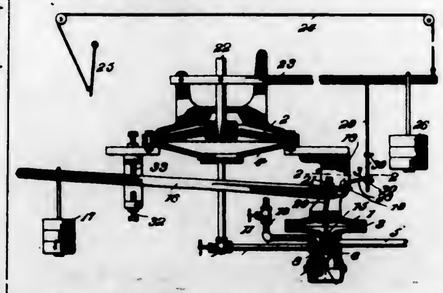
8. A metallic railway-tie comprising a beam having a vertical web and top and bottom members, means for giving elasticity to the tie comprising horizontally-disposed slots formed in the web, and outwardly-extending projections formed integral with the web, substantially as set forth.

9. A metallic railway-tie comprising a beam having a vertical web and top and bottom members, engaging lugs formed integral with the top member, means for giving elasticity to the tie comprising horizontally-disposed slots formed in the web, and outwardly-extending projections formed integral with the web, substantially as set forth.

10. A metallic railway-tie comprising an I-beam having horizontally-disposed slots formed in its web for giving elasticity to the tie, engaging lugs formed integral with its top member, and outwardly-extending projections formed integral with the web, substantially as set forth.

11. A metallic railway-tie comprising an I-beam having a horizontally-disposed slot formed in its web at each end of the beam for giving elasticity to the tie, engaging lugs formed integral with its top member, and outwardly-extending projections formed integral with the web, substantially as set forth.

813,669. DAMPER-REGULATOR. EDWIN B. RAYNER, Piqua, Ohio, assignor to The Lagonda Manufacturing Co., Springfield, Ohio. Filed Dec. 23, 1904. Serial No. 238,164.



Claim.—1. In a damper-regulator, the combination of a damper, a diaphragm-motor operably connected with said damper, a fluid-pressure-supply pipe leading to the diaphragm-motor, a valve governing the passage of pressure medium through said pipe, an exhaust governed by said valve, a pressure balance-lever, spaced adjustable set-screws arranged upon opposite sides of said lever to limit the movement thereof, a rod connected at one end with the valve aforesaid and at its other end with the pressure balance-lever, a set-screw applied to the balance-lever and engaging an end of the rod aforesaid to establish an adjustable connection between said lever and the rod, and means for actuating the pressure balance-lever.

2. In a damper-regulator, the combination of a pressure diaphragm-motor, a working diaphragm-motor, a fluid-supply pipe leading to the working diaphragm-motor, a valve operated by the pressure diaphragm-motor and governing the supply of pressure medium through the supply-pipe aforesaid, a counterbalance-lever, means operably connecting the lever and the pressure diaphragm-motor, a fulcrum member on which said counterbalance-lever is fulcrumed, and means operable by the working diaphragm-motor for actuating the fulcrum member of the counterbalance-lever to shift the point of fulcrum thereof and vary the sensitiveness of said lever.

3. In a damper-regulator, the combination of damper-controlling mechanism including a diaphragm-motor, pressure balance means including a balance-lever, and means for actuating the pressure balance-lever to shift the point of fulcrum thereof and vary the sensitiveness of the regulator.

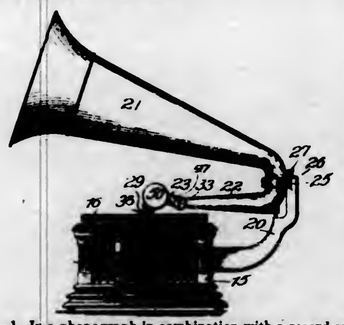
4. In a damper-regulator, the combination of damper-controlling mechanism including a diaphragm-motor, pressure balance means embodying a balance-lever, means operably connecting the lever with the diaphragm-motor, a fulcrum for said lever, and means for automatically shifting the lever to vary the leverage thereof with reference to its fulcrum.

5. In a damper-regulator, the combination of a pressure diaphragm-motor, a working diaphragm-motor, a fluid-supply pipe leading to the working diaphragm-motor, a valve operated by the pressure diaphragm-motor and governing the supply of pressure medium through the supply-pipe, a counterbalance-lever for the pressure diaphragm-motor, a fulcrum member for the counterbalance-lever, a damper-lever connecting with the working diaphragm-motor, and adjustable means connecting the fulcrum member aforesaid with the damper-lever for actuating the fulcrum member.

6. In a damper-regulator, the combination of a pressure diaphragm-motor, a working diaphragm-motor, a fluid-pressure pipe leading to the working diaphragm-motor, a valve operated by the pressure diaphragm-motor and governing the supply of pressure medium through the supply-pipe, a counterbalance-lever for the pressure diaphragm-motor, a movable fulcrum for the counterbalance-lever, a damper-lever connected with the working diaphragm-motor, and means carried by the damper-lever for shifting the fulcrum of the counterbalance-lever, as set forth.

7. In a damper-regulator, the combination of a pressure diaphragm-motor, a working diaphragm-motor, a fluid-pressure pipe leading to the working diaphragm-motor, a valve operated by the pressure diaphragm-motor, and governing the supply of pressure medium through the supply-pipe, a counterbalance-lever for the pressure diaphragm-motor, a fulcrum member for said lever, a damper-lever connected with the working diaphragm-motor, and an actuating device carried by the damper-lever and connected with the fulcrum member for shifting the latter and the counterbalance-lever, as set forth.

813,670. PHONOGRAPH. EUGENE M. ROBINSON, Chicago, Ill. Filed Mar. 22, 1905. Serial No. 251,470.



Claim.—1. In a phonograph in combination with a record and reproducer in operative connection therewith; a horn attached to said reproducer having a distinct angle in it between its ends and a valve mounted in one angular portion of the horn adjacent to said angle adapted to be moved to two different positions to close off the admission of sound-waves from one angular portion of the horn to the other portion of the horn adjacent to said angle.

2. In a phonograph in combination with a record and reproducer in operative connection therewith; a horn attached to said reproducer having a distinct angle in it between its ends and a valve mounted in one angular portion of the horn adjacent to said angle adapted to be rotated on its axis from outside of the horn to close off the admission of sound-waves from one angular portion of the horn to the other portion of the horn adjacent to said angle.

3. In a phonograph in combination with a record and reproducer in operative connection therewith; a horn attached to said reproducer having a distinct angle in it between its ends and a tubular valve mounted in one angular portion of the horn adjacent to said angle adapted to be moved to two different positions to close off the admission of sound-waves from one angular portion of the horn to the other portion of the horn adjacent to said angle.

4. In a phonograph in combination with a record and reproducer in operative connection therewith; a horn attached to said reproducer having a distinct angle in it between its ends and a tubular valve mounted in one angular portion of the horn adjacent to said angle adapted to be rotated on its axis to close off the admission of sound-waves from one angular portion of the horn to the other portion of the horn adjacent to said angle.

5. In a phonograph in combination with a record and reproducer in operative connection therewith; a horn attached to said reproducer made in two pieces joining each other at a distinct angle, one of said horn-pieces being rotatable with reference to the other at said angle-joint and a valve mounted in the joint connecting the said two portions of the horn adapted to be moved from outside of the horn to regulate the opening connecting the two portions of the horn.

6. In a phonograph in combination with a record and a reproducer in operative connection therewith; a horn attached to said reproducer made in two pieces or portions joining each other at a distinct angle one of the horn portions being rotatable with reference to the other portion and a tubular rotatable valve mounted in the joint connecting the two pieces of the horn adapted to be moved from outside the horn to regulate the opening connecting the two portions of the horn.

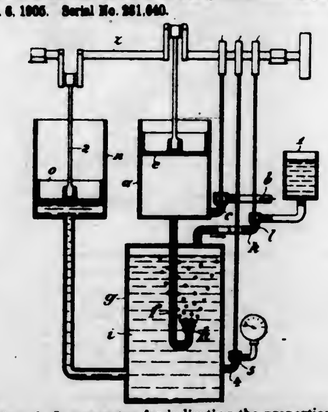
7. In a phonograph in combination with a record and a reproducer in operative connection therewith; a horn made in two parts, an elbow on one of said parts to which the other part of the horn is connected and a rotatable tubular valve mounted in said elbow adapted to normally allow sound-waves to pass from one portion of the horn to the other and adapted to be rotated on its axis from outside the horn to close said passage-way.

8. In a phonograph in combination with a record and a reproducer in operative connection therewith; a horn made in two parts, an elbow on one of said parts, a bearing on the end of the other part journaled in said elbow, a cap closing the end of the second horn part adjacent to said elbow, a crank-handle attached to a shaft extending through said cap and a tubular rotatable valve rigidly mounted on said shaft inside the bearing of the second portion of the horn adapted to normally allow air to pass from one portion of the horn to the other and adapted to be rotated by turning said crank-handle to close said passage-way.

9. In a phonograph in combination with a record having a reproducer in operative connection therewith a horn made in two parts, an elbow 30 on one of said parts, a bearing 31 on the other of said horn parts, journaled within said elbow 30, a shoulder 32 on the second horn portion bearing against said elbow, a cap 33 also bearing against said elbow and screws threaded into said bearing 31, a rotatable valve 40 journaled inside said bearing 31, a shaft 45 secured to said valve 40 passing through the cap 33, a crank-handle 48 connected to said shaft 45 by which said valve may be rotated, the whole being so arranged that in one position sound-waves from the reproducer may pass from one of said horn portions through the valve into the other portion of the horn and that rotating said valve 40 on its axis first reduces and finally substantially cuts off the passage of sound-waves through the horn all of the parts being shaped, arranged and disposed substantially as shown and described for the purposes set forth.

10. As an article of manufacture for use in mechanism of the class described, a short horn-section 53 having damper mechanism mounted therein, said horn-section being adapted when inserted in a break or cut in the horn to fit over one portion of the horn adjacent to said cut and inside the other horn portion adjacent to said cut as described.

813,671. APPARATUS FOR ANALYSIS OF GASES. ALFRED SCHLATTER and LUDWIG DEUTSCH, Budapest, Austria-Hungary. Filed Oct. 6, 1905. Serial No. 281,640.



Claim.—1. In apparatus for indicating the proportion of carbonic acid contained in combustion-gases, a piston-pump of determinated stroke volume, means for continually driving the pump, an absorption vessel, means for connecting the absorption vessel with the piston-pump and means for expelling the analyzed gases out of the absorption vessel.

2. In apparatus for indicating the proportion of carbonic acid contained in combustion-gases, a piston-pump of determinated stroke volume, means for continually driving the pump, means for introducing the gases to be analyzed in the suction-pipe of the piston-pump, means for connecting the absorption vessel with the pressure-pipe of the piston-pump and means for expelling the analyzed gases out of the absorption vessel.

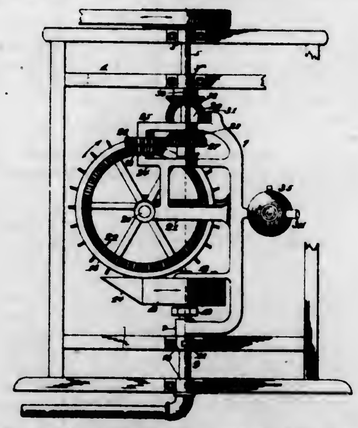
3. In apparatus for indicating the proportion of carbonic acid contained in combustion-gases, a piston-pump of determinated stroke volume, means for continually driving the pump, an absorption vessel, means for connecting the absorption vessel with the piston-pump and a cylinder having a piston for expelling the analyzed gases out of the absorption vessel.

4. In apparatus for indicating the proportion of carbonic acid contained in combustion-gases, a piston-pump of determinated stroke volume, means for continually driving the pump, an absorption vessel, means for connecting the absorption vessel with the piston-pump, a cylinder having a piston, means for connecting the cylinder with the liquid-space of the absorption vessel and means for indicating the stroke of the piston of the cylinder.

5. In apparatus for indicating the proportion of carbonic acid contained in combustion-gases, a piston of determinated stroke volume, means for continually driving the pump, an absorption vessel, means for connecting the absorption vessel with the piston-pump, a cylinder having a piston, means for connecting the cylinder with the liquid-space of the absorption vessel, means for indicating the stroke of the piston of the cylinder, means to brake these indicating means and means to release the indicating means at the end of the stroke of the piston.

6. In apparatus for indicating the proportion of carbonic acid contained in combustion-gases, a piston-pump of determinated stroke volume, means for continually driving the pump, an absorption vessel, means for connecting the absorption vessel with the piston-pump, means for expelling the analyzed gases out of the absorption vessel and means for replenishing the consumed absorption liquid.

813,672. **WATER-WHEEL.** JOSEPH SCHULTE, Jr., Walford, Iowa. Filed July 10, 1905. Serial No. 269,089.



Claim.—1. The combination of a water-wheel, a sluice-gate therefor, a carrying-frame for said wheel and sluice, and gearing adapted to carry the wheel and its connections in an orbit around the axis of said frame, and transverse to the axis of said wheel.

2. The combination of a water-wheel, a sluice-gate to receive the dip of the wheel-blades, a head central to said sluice-gate, and having radial waterways therein, a central water-pipe connecting with said head, a frame on which the wheel and sluice are mounted, bearings to carry said frame and its connections revolubly about an axis central to said water-head, and gearing connecting with the water-wheel whereby said wheel is made to move in an orbit about an axis transverse to its own.

3. In combination with water-wheel mechanism, substantially as described, a cylindrical sluice-gate with a tangential outlet to take the dip of the wheel-blades, a water-head central to said sluice-gate, with radial waterways therein, a water-pipe communicating with said waterways, and mechanism adapted to rotate the sluice-gate around said water-head.

4. The combination of a main frame, an inner frame journaled to revolve inside said main frame, a pinion fixed to said main frame, a water-wheel mounted on the inner frame and adapted to revolve in a plane transversely diagonal to the axis of the frame's revolution, a sluice-gate mounted on said inner frame, and gearing connecting the fixed pinion with the water-wheel, whereby it is made to revolve in an orbit transverse to its own axis.

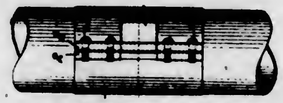
813,673. **RAIL FASTENING AND SUPPORT.** SAMUEL J. SCOTT, Columbus, Ohio. Filed June 17, 1905. Serial No. 265,670.

Claim.—1. The combination with a metallic railway-tie having an opening, of means for fastening and supporting a rail on the tie comprising bifurcated clamp members inserted through the opening and having their upper portions engaging with the rail, one or more devices projecting from each side of the tie about which one of the clamp members is engaged, and means for fastening the clamp members and the said projecting device together.

2. The combination with a metallic railway-tie having a transverse opening, of means for fastening and supporting a rail on the tie comprising angle-irons secured to the tie and projecting therefrom adjacent the opening thereof, bifurcated clamp members embracing the tie through its opening and having their upper ends engaged about the rail, one of said clamp members having its lower ends engaged about the angle-irons, and means for fastening the bifurcated portions of the clamp members and the angle-irons together.

3. The combination with a metallic railway-tie having a vertical web portion and laterally-extending flanges provided with an opening, of means for fastening and supporting a rail on the tie comprising bifurcated clamp members embracing the web of the tie through the opening and engaging over the lower portion of the rail at their upper ends, the said clamp members resting on the flanges of the tie beneath the rail, angle-irons secured to the web of the rail on opposite sides beneath the flanges and adjacent the openings, one of the said clamp members having its bifurcated portion engaging about the angle-irons, and means for fastening the clamp members and the angle-irons together.

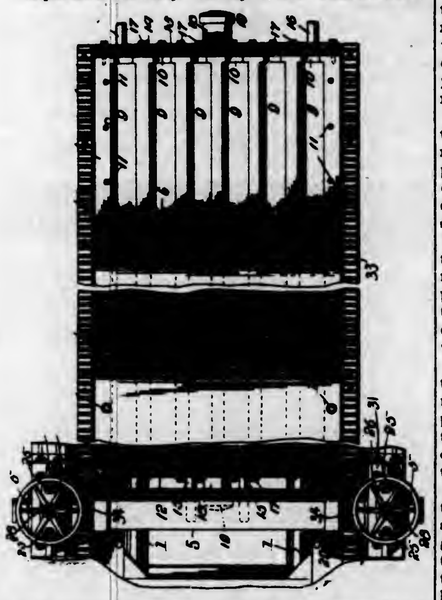
813,674. **CLAMPING-SLEEVE FOR PNEUMATIC-DESPATCH TUBES.** JOHN F. SKINNOW, East Orange, N. J. Filed June 24, 1905. Serial No. 266,731.



Claim.—1. A clamping-sleeve for pneumatic-despatch tubes comprising a broad sheet of thin flexible material adapted to be bent around a tube and provided at its longitudinal edges with outward-extending clamping-bars, a broad tongue formed on one longitudinal edge of said sleeve midway the ends thereof, a tongue-receiving socket being formed in the inner surface of said sleeve at the other longitudinal edge thereof and adapted to receive said tongue, whereby said tongue will bridge the joint between the longitudinal edges of the sleeve, and broad bearing and clamping surfaces will be provided on each side of the tongue and socket, and clamping-screws threaded through the clamping-bars on each side of th socket and tongue, said screws being adapted to draw together the longitudinal edges of the sleeve.

2. A clamping-sleeve for pneumatic tubes consisting of a longitudinally-split sleeve of thin resilient material adapted to be folded about the said tubes, the longitudinal edges of said sleeve being folded around longitudinal bars to form stiff clamping members, means secured to said clamping members to draw the two edges of the sleeve together, an outward-extending tongue or bridge-piece formed on one longitudinal edge of the sleeve, a socket being formed in the other edge of said sleeve on the inner side thereof to receive said tongue or bridge-piece when the two clamping members are drawn together.

813,675. **GLASS-CASTING APPARATUS.** JAMES R. SYMES, Pittsburg, and HENRY A. OTTO, Allegheny, Pa., assignors, by mesne assignments, to The Mississippi Wire Glass Company, Jersey City, N. J., a Corporation of New Jersey. Filed Apr. 9, 1903. Serial No. 151,948.



Claim.—1. A fluid-cooled casting-bed having contiguous sections so constructed that, when the sections are assembled open-ended parallel internal passages are thereby formed, channeled end sections bridging the ends of the passages, and inlet and outlet pipes connected respectively to the end sections.

2. In a glass-casting apparatus, a casting-bed having a plurality of separable external casting-surfaces, a support therefor during casting operations, and journals independent of the support, whereon the bed may after a casting operation be supported and rotated to bring a second casting-surface uppermost.

813,676. **VEHICLE-TIRE.** GEORGE M. STADELMAN, Akron, Ohio. Filed Apr. 26, 1904. Serial No. 205,016.

Claim.—1. In combination with the rim of a vehicle-wheel, a cushioning-tire upon said rim having its sides formed with circumferential retaining-band seats, retaining-bands extending about said seats, and rigid guiding means for said bands at the sides of the tire, unyieldingly supported on said rim and operating to guide said bands inwardly and downwardly against their seats and retain the tire in the rim-channel.

2. In combination with the rim of a vehicle-wheel, a cushioning-tire upon said rim, having a circumferential seat, a retaining-band extending about said seat and contacting with the yielding surface thereof, substantially throughout its circumference, and a plurality of rigid band-guides unyieldingly supported on said rim tending to maintain the engagement of said band with said seat.

3. In combination with the rim of a vehicle-wheel, a cushioning-tire upon said rim, having a circumferential seat, and a plurality of rigid band-guides unyieldingly supported on said rim and tending to maintain the engagement of said band with said seat at the points on the latter which coincide with the ends of said guides.

4. In combination with the rim of a vehicle-wheel, a cushioning-tire upon said rim, having a circumferential seat, a retaining-band extending about said seat, and a plurality of rigid band-guides unyieldingly supported on said rim, said guides terminating at their ends adjacent to the edge of the shoulder of said seat and tending to maintain the engagement of said band with said seat.

5. In combination with the rim of a vehicle-wheel, a cushioning-tire upon said rim formed with a circumferential seat about each side, retaining-bands extending around said seats and each contacting with the yielding surface of its seat substantially throughout the circumference of the latter, and a plurality of rigid band-guides unyieldingly supported on said rim and tending to maintain the engagement of said bands with said seats.

6. In combination with the rim of a vehicle-wheel, a cushioning-tire upon said rim formed with a circumferential seat about each side, retaining-bands extending around said seats, and band-guiding plates formed with end flanges, extending at intervals across the base of the tire with the flanges terminating adjacent to the edges of said seats and tending to maintain engagement of the bands with their seats.

7. In combination with the rim of a vehicle-wheel, a cushioning-tire upon said rim formed with a circumferential seat about each side, retaining-bands extending around said seats, and band-guiding plates molded at intervals into the base of the tire to extend across the same and formed with end flanges terminating adjacent to the edges of said seats and tending to maintain engagement of the bands with their seats.

8. In combination with the rim of a vehicle-wheel, a cushioning-tire upon said rim formed with a circumferential seat about each side, retaining-bands extending around said seats, and band-guiding plates molded at intervals into the base of the tire to extend across the same and formed with end flanges provided with inwardly-inclined extremities terminating adjacent to the edges of said seats and tending to maintain engagement of the bands with their seats.

9. In a vehicle-tire, the combination with a rim of an elastic tire, having a circumferentially-extending seat or shoulder at each side thereof, retaining-bands extending around said seats and band-guides comprising a base portion extending beneath the base of the tire, and side flanges terminating adjacent to the seats, and having their outer ends beveled inwardly toward the seats for causing said bands to cling to said seats.

813,677. **COMBINED BAYONET AND TELESCOPE.** FREDERICK W. STILLWELL, Scranton, Pa. Filed Mar. 17, 1905. Serial No. 250,745.

Claim.—1. A device of the class described comprising both a telescope and a bayonet, and means for adjustably securing the device alongside a gun-barrel.

2. A device of the class described comprising a tubular body portion, a removable bayonet-tip, and a magnifying-lens within the body portion.

3. A device of the class described comprising a tubular body portion, means for attaching the same to the barrel of a rifle or similar arm, magnifying-lens within the body portion, and a removable bayonet-tip for the body portion.

4. A device of the class described comprising the tubular body portion, a plurality of lenses held spaced apart within the body portion, means for securing said body portion to a rifle or similar arm,

and a removable bayonet-tip designed to be secured at the end of the tubular portion.

and for such tray extending beyond the cards on all four of their edges, grooves in each front and rear ends and a flexible cover shorter

through the hopper while the downward-moving part passes outside

said tachometer, connections between said shaft and cyclometer for

and a removable bayonet-tip designed to be secured at the end of the tubular portion.

5. A device of the class described comprising a tubular body portion, lenses arranged within the body portion, a bayonet-tip secured at one end of such body, means for detachably securing the body-tube to the barrel of a rifle or the like, and a guard having seats for both the barrel of the rifle and the tubular body.

6. A device of the class described comprising a tapering tubular body portion, a relatively large lens secured within the body portion near the large end thereof, a second lens secured within the body portion near the narrowed end thereof, a removable bayonet-tip threaded into the narrowed end of such tubular body portion, and means for detachably securing the device to a rifle.

7. The combination with a rifle or similar arm, of a combined bayonet and telescope comprising a tubular body portion, a bayonet-tip therefor, lenses arranged within the body portion, means for securing such body portion to the end of a rifle-barrel, and means for securing such body portion in a reversed position to the rifle when the tip is removed and the device is used as a telescope.

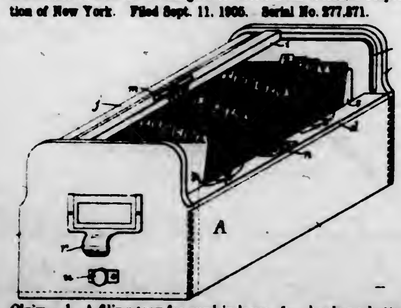
813,678. **VEHICLE-SPRING.** JOHN W. SUTTON, Collinsville, Ind. Ter. Filed Jan. 21, 1905. Serial No. 242,143.

Claim.—1. In a vehicle, a spring formed of a coil of resilient wire, means for coupling said spring between the running-gear and the body of the vehicle, a relief-spring connected at one end to the running-gear, and a flexible coupling element between the free end of said relief-spring and the vehicle-body and extending through said coiled spring.

2. In a vehicle, a plate having spaced apertures and with means for coupling to the running-gear of the vehicle, a spring formed from a coil of resilient wire and connected at one end to said plate and at the other end to the body of the vehicle, a relief-spring connected at one end to the running-gear and extending at the other end beneath said plate, and flexible coupling means between said vehicle-body and the free end of said relief-spring and extending through the apertures in said plate.

3. In a vehicle, a spring formed of a coil of resilient wire, means for coupling said spring between the running-gear and the body of the vehicle, a relief-spring formed of spaced coils connected at one end by a transverse bar and with the other ends extended, said transverse connecting-bar disposed between the bolster member and axle of the vehicle, and a flexible coupling element between the free ends of said relief-spring and the vehicle-body.

813,679. **FILING-TRAY FOR CARD-INDEXES, &c.** AUGUST G. VETTER, Rochester, N. Y., assignor to Vetter Desk Works, a Corporation of New York. Filed Sept. 11, 1905. Serial No. 277,871.



Claim.—1. A filing-tray for card-indexes, &c., having a bottom and suitable side and end pieces arranged to support the cards and expose them on one of their edges and a cover for such tray adapted in all of its positions relatively to such tray to be contained within the space between such end pieces and inclosed by lines connecting the same at any and all corresponding points on their edge peripheries.

2. A filing-tray for card-indexes, &c., having a front and a rear end for such tray extending beyond the cards on all four of their edges, grooves in such front and rear ends and a flexible cover shorter than the straightened-out length of such grooves and arranged to work therein and adapted when open to expose the cards on one edge thereof.

3. A filing-tray for card-indexes, &c., having a bottom and suitable side and end pieces arranged to support the cards and expose them on one of their edges and part way down on one of their adjacent sides and a cover for such tray adapted in all of its positions relatively to such tray to be contained within the space between such end pieces and inclosed by lines connecting the same at any and all corresponding points on their edge peripheries.

4. A filing-tray for card-indexes, &c., having a bottom and suitable side and end pieces arranged to support the cards and expose them on one of their edges and part way down on two adjacent sides and a cover for such tray adapted in all of its positions relatively to such tray to be contained within the space between such end pieces and inclosed by lines connecting the same at any and all corresponding points on their edge peripheries.

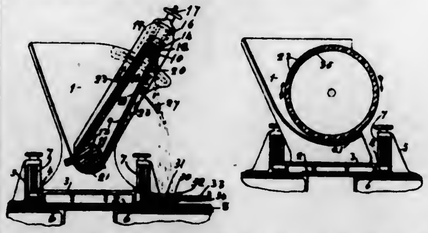
5. A filing-tray for card-indexes, &c., having a front and a rear end for such tray extending beyond the cards on all four of their edges, grooves in such front and rear ends and a flexible cover shorter than the straightened-out length of such grooves and arranged to work therein and adapted when open to expose the cards on one edge thereof and a part of an adjacent slide.

6. A filing-tray for card-indexes, &c., having a front and a rear end for such tray extending beyond the cards on all four of their edges, grooves in such front and rear ends and a flexible cover shorter than the straightened-out length of such grooves and arranged to work therein and adapted when open to expose the cards on one edge thereof and a part of two adjacent sides.

7. In a filing-tray for card-indexes, &c., adapted to support the cards and expose them on one edge and a part of an adjacent edge, a front and a rear end for such tray extending beyond the cards on all four of their edges, grooves in such front and rear ends and a flexible cover shorter than the straightened-out length of such groove and arranged to work therein, that portion of such grooves in the end pieces arranged to receive the cover when open concealed between the extreme outsides of the box and internal partitions for supporting and retaining the cards.

8. In a filing-tray for card-indexes, &c., adapted to receive and support the cards and expose them on one edge and a part of two adjacent edges, a front and rear end for such tray extending beyond the cards on all four of their edges, grooves in such front and rear ends and a flexible cover shorter than the straightened-out length of such groove and arranged to work therein, that portion of such grooves in the end pieces arranged to receive the cover when open concealed between the extreme outsides of the box and internal partitions for supporting and retaining the cards.

813,680. **SPRINKLING GRANULAR SUBSTANCES ON DOUGH IN BISCUIT-CUTTING MACHINES.** THOMAS VICARS and JOHN VICARS, the Younger, Burlestown, England. Filed Oct. 25, 1904. Serial No. 229,940.



Claim.—1. In combination with biscuit-machines a hopper for containing the substance to be distributed, a conveyor having an uneven surface adapted to support a granular substance, the upward-moving part of the conveyor passing through the hopper while the downward-moving part passes outside the hopper, and mechanism for moving the conveyor to drop the granular substance on dough underneath the conveyor, substantially as described.

2. In combination with biscuit-machines a hopper for containing the granular substance to be distributed, an endless traveling sheet having an uneven surface passing round rollers at the top and bottom of the hopper the upward-moving part of the sheet passing through the hopper while the downward-moving part passes outside the hopper, a perforated plate below the conveyer, a solid plate arranged to be slid under the perforated plate, and mechanism for moving the conveyer to drop the granular substance through the perforated plate onto dough underneath such plate, substantially as described.

through the hopper while the downward-moving part passes outside the hopper, and mechanism for moving the sheet to drop the granular substance on dough underneath the sheet, substantially as described.

3. In combination with biscuit-machines a hopper for containing the granular substance to be distributed, an endless traveling sheet having an uneven surface passing round rollers at the top and bottom of the hopper the upward-moving part of the sheet passing through the hopper while the downward-moving part passes outside the hopper, the upper roller being adjustably supported on movable side plates and the back plate of the hopper being also fixed to the side plates, and mechanism for moving the sheet to drop the granular substance on dough underneath the sheet, substantially as described.

4. In combination with biscuit-machines a hopper for containing the granular substance to be distributed, an endless traveling sheet having an uneven surface passing round rollers at the top and bottom of the hopper the upward-moving part of the sheet passing through the hopper while the downward-moving part passes outside the hopper, circumferential grooves in the rollers and guiding-strips on the inner side of the traveling sheet fitting in the grooves, and mechanism for moving the sheet to drop the granular substance on dough underneath the sheet, substantially as described.

5. In combination with biscuit-machines a hopper for containing the substance to be distributed, a conveyor having an uneven surface adapted to support a granular substance the upward-moving part of the conveyor passing through the hopper while the downward-moving part passes outside the hopper, devices for varying the supporting capacity of the uneven conveyer-surface, and mechanism for moving the conveyor to drop the granular substance on dough underneath the conveyor, substantially as described.

6. In combination with biscuit-machines a hopper for containing the substance to be distributed, a conveyor having an uneven surface adapted to support a granular substance the upward-moving part of the conveyor passing through the hopper while the downward-moving part passes outside the hopper, a perforated plate below the conveyer, a solid plate arranged to be slid under the perforated plate, and mechanism for moving the conveyer to drop the granular substance through the perforated plate onto dough underneath such plate, substantially as described.

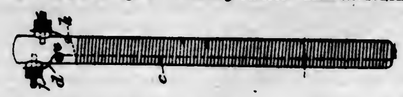
813,681. **COMBINED TACHOMETER AND CYCLOMETER.** CHARLES H. WARNER, Beloit, Wis. Filed Sept. 6, 1904. Serial No. 223,242.

Claim.—1. The combination with a shaft and means for rotating the same, of a tachometer having a hub, a sleeve connected to said hub, and a cyclometer, and means actuated by the rotations of said shaft for operating said tachometer and cyclometer, the cyclometer-actuating means being inclosed within said sleeve.

2. The combination with a casing and a sleeve or drum carried thereby, a magnetic tachometer arranged within said casing, a cyclometer supported respectively by said casing and sleeve or drum, a shaft extending through said drum or sleeve, and means operated by the rotations of said shaft for actuating both said tachometer and said cyclometer, the cyclometer-operating means being arranged within said sleeve or drum.

3. The combination with a magnetic tachometer having a rotating part, an inclosing casing therefor, a sleeve carried by said casing, a casting connected at one end to said casing and at the other end to said sleeve, a cyclometer supported by said casting, a shaft extending through said sleeve and connected to the rotating part of said tachometer, connections between said shaft and cyclometer for actuating the latter, said connections inclosed within said sleeve and means for rotating said shaft.

813,682. **THERMOPILE.** MEYER WILDERMAN and ROBERT L. MOSS, London, England. Filed Aug. 14, 1905. Serial No. 274,162.



Claim.—1. A method of manufacturing thermopiles, consisting in drawing out to the desired thinness a compound wire strip or the like composed of a core and cover of different materials, removing the cover at intervals and so arranging the alternate compound and single portions that one set of corresponding ends of the various compound portions may be exposed to one temperature and the other set of corresponding ends may be exposed to another temperature, substantially as described.

2. A method of manufacturing thermopiles, consisting in drawing out to the desired thinness a compound wire strip or the like composed of a core and cover of different materials, removing the outer metal at intervals by immersing portions of the wire strip in a suitable acid or reagent and so arranging the alternate compound and single portions that one set of corresponding ends of the various compound portions may be exposed to one temperature and the other set of corresponding ends may be exposed to another temperature, substantially as described.

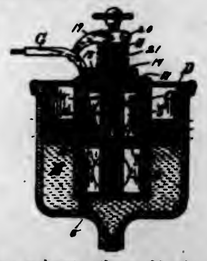
3. A method of manufacturing thermopiles, consisting in drawing out to the desired thinness a compound wire strip or the like composed of a core and cover of different materials, coating the compound wire strip at intervals with a substance impervious to acid or reagent and immersing the wire or strip in acid or reagent until the outer metal between such coated portions is removed and so arranging the alternate compound and single portions that one set of corresponding ends of the various compound portions may be exposed to one temperature and the other set of corresponding ends may be exposed to another temperature, substantially as described.

4. A thermopile consisting of a drawn metal or alloy wire strip or the like having at intervals in its length and in metallic contact therewith a cover of another drawn metal or alloy, the wire strip or the like being so arranged that one set of corresponding ends of the covered portions can be exposed to one temperature, and the other set to another temperature, substantially as described.

5. A thermopile consisting of a rod of insulating material upon which is wound a drawn wire around and drawn into metallic contact with which are pieces of a metal different from that of the wire, the covered portions of the wire being on one side of the rod and the uncovered portions on the other side so that one set of corresponding ends of the covering portions are on one side of the rod and the other set of corresponding ends are on the other side, substantially as and for the purpose described

---

813,683. **CARBURETER.** EARL B. ADAMS, Battle Creek, Mich. Filed Apr. 10, 1905. Serial No. 254,705.



Claims.—1. In a carburetor, the combination of an encircling gasolene-reservoir, a float-controlled valve to supply said reservoir, a central chamber suspended within said reservoir, a diaphragm having an opening separating said chamber into an upper and a lower compartment, an air-valve operative on and adapted to vary the opening in said diaphragm, a spray-nozzle opening upward in close proximity to said opening in the upper compartment, an exhaust-

port to said compartment, an air-inlet to the lower compartment, and means to control said valve and spray-nozzle, substantially as set forth.

2. The combination of an annular chamber, a float-controlled valve to supply said chamber, a diaphragm having an opening separating said chamber into an upper and a lower compartment, an air-valve operative on and adapted to vary the opening in said diaphragm, a spray-nozzle opening upward in close proximity to said opening in the upper compartment, an exhaust-port to said compartment, an air-inlet to the lower compartment, and means to control said valve and spray-nozzle, substantially as set forth.

2. In a motor road-vehicle, a steering mechanism, a locking member non-rotatively connected to the vehicle, a steering-handle

3. In an electric motor, the combination with recording mechanism comprising an electromagnetically-controlled regulator, a

ism for opposing its operation under the sole action of the auxiliary shunt-coil when the main coil is inactive.

port to said compartment, an air-inlet to the lower compartment, and means to control said valve and spray-nozzle, substantially as set forth.

2. The combination of an encircling gasolene-reservoir, a float-controlled tapering valve to supply said reservoir, a central chamber suspended within said reservoir, a stand-pipe leading from said gasolene-reservoir through the center of said chamber, a diaphragm having an opening separating said chamber into an upper and a lower compartment, an air-valve operative on and adapted to vary the opening in said diaphragm, a spray-nozzle leading from said stand-pipe in close proximity to said opening in the upper compartment, an exhaust-port in said compartment, an air-inlet to the lower compartment and means to control said valve and spray-nozzle, substantially as set forth.

3. In a carbureter, the combination with an encircling gasolene-reservoir, and a float-controlled valve to supply said reservoir, of a central chamber suspended within and forming a part of said reservoir, said chamber being separated into an upper and a lower compartment by means of an apertured diaphragm, an air-inlet communicative with the lower compartment and an exhaust-port leading from said upper compartment, a valve operative on and adapted to open and close said apertured diaphragm, means to actuate said valve, a spray-nozzle communicative with said upper chamber at a point above and in close proximity to the aperture in said diaphragm, a valve to control said spray, and a lever to control said valve, for the purpose set forth.

4. In a carbureter, the combination with an air-chamber, of a vaporizing-chamber, an air-passage connecting said chambers, a valve adapted to vary the opening to said air-passage between said chambers, a stand-pipe leading through said chambers, a spray-nozzle leading from said pipe and opening above said air-passage within said vaporizing-chamber, an arm on said valve, a needle-valve in the stand-pipe to control the gas-forming fluid, a clamp carried by said needle-valve having a fixed connection to the valve controlling the opening between the vaporizing and air chambers, means located between said arm and said valve to hold the latter to its seat, a gasolene-reservoir encompassing said vaporizing and air chambers, a float carrying a tapering valve to control the feed-supply to said reservoir, said stand-pipe communicating with said reservoirs, and an inlet-pipe communicating with said valve, substantially as and for the purpose set forth.

5. In a carbureter, a gasolene-reservoir comprising an open-top cylindrical body having an indrawn bottom provided with a drainage-trap, a concentrically-disposed open-top chamber suspended within said reservoir and forming a part therewith by means of a uniting-web, an apertured diaphragm separating said chamber into an upper and a lower compartment, an exhaust-port leading through said web from said upper compartment, a waste-tube leading from said lower compartment through said reservoir, a stand-pipe communicative with said reservoir and passing through said compartments, a spray-nozzle leading from said stand-pipe and opening within said upper compartment, a valve to control said spray-nozzle, a valve operative on and adapted to vary the opening in said diaphragm, means to actuate both of said valves simultaneously, a cap to said reservoir, a float-controlled valve to supply said reservoir, and an inlet-pipe communicating with said float-valve, substantially as, and for the purpose set forth.

818,684. **MOTOR-CAR FOR PREVENTING SIDE SLIP.** THOMAS G. ALLEN, London, England. Filed Jan. 6, 1905. Serial No. 239,859.

Claim.—1. In a motor road-vehicle, a means for preventing unintentional operation of the steering-wheels during side slip, or the like, by utilising the natural grasp of the operator to lock said steering-wheels relatively to the vehicle-body, comprising a steering mechanism, a steering-handle connected thereto, said parts being normally free to operate to turn said wheels, and a member arranged in a position sufficiently close to said handle to permit both to be grasped by the same hand, said member being so mounted that it is rigidly connected to the vehicle-body when said handle and member are forcibly clasped by the hand.

2. In a motor road-vehicle, a steering mechanism, a locking member non-rotatively connected to the vehicle, a steering-handle connected to said mechanism, means for mounting said handle so that it has a definite path of movement with relation to said member, said handle and member being mounted closely adjacent to each other, and being adapted to be grasped by the hand of the operator, so as to lock said handle against movement relatively to said member.

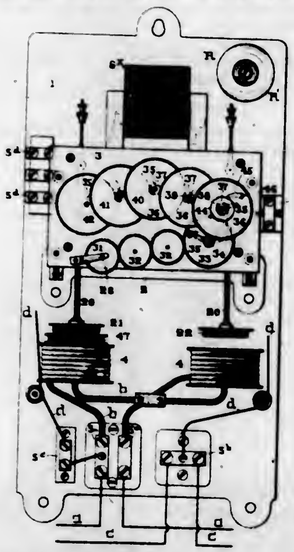
3. For preventing side slip in motor road-vehicles the combination with the steering-handle of means fixed to the other part of the vehicle in which the handle turns, and so disposed in regard to the steering-handle that the driver may grip both the said fixed means and the steering-handle in one hand at one time and so lock the same together as and when required while the vehicle is in motion.

4. In a motor road-vehicle, a steering mechanism, a steering-wheel connected thereto, and a disk non-rotatively connected to the vehicle in substantially concentric relation to the steering-wheel, said disk and wheel being closely adjacent to each other so both may be grasped by one hand of the operator.

5. For preventing side slip in motor road-vehicles the combination of a steering-wheel, a steering-shaft operated by said wheel, a fixed part in which said steering-shaft turns, a disk fixed to the said fixed part just beneath the steering-wheel, the said disk being such that the driver can grip the same and hold the steering-wheel fast thereto or turn the steering-wheel freely as and when required while the vehicle is in motion.

6. In a motor road-vehicle, a steering mechanism, a steering-wheel, a disk mounted closely adjacent to said steering-wheel in substantially concentric relation thereto, a tube, and a post within said tube, the one being non-rotatively mounted with relation to the vehicle, and carrying said disk, and the other being connected to the steering mechanism and carrying said wheel.

813,685. **ELECTRICITY-METER.** HERMANN ARON, Charlottenburg, Germany. Filed Jan. 13, 1904. Serial No. 188,849.



Claim.—1. In an electric meter, the combination with recording mechanism comprising a regulator electromagnetically controlled in its action by current passing through the main circuit, of means acting automatically when the flow of current through the main circuit is interrupted for inducing a retrograde movement of said recording mechanism, and means independent thereof for detaining the same against such retrograde movement.

2. In an electric meter, the combination with the recording mechanism comprising a regulator electromagnetically controlled in its action by current passing through the main circuit, of continuously-energized means for automatically assuming control of the recording mechanism when the flow of current through the main circuit is interrupted.

3. In an electric meter, the combination with recording mechanism comprising an electromagnetically-controlled regulator, a main magnet-coil connected with the main circuit from the source of current-supply and acting upon said regulator, and an auxiliary magnet-coil also acting upon said regulator and connected with a shunt-circuit from the source of current-supply.

4. In an electric meter, the combination with the recording mechanism, comprising an electromagnetically-controlled regulator, a main magnet-coil connected with the main circuit from the source of current-supply and acting upon said regulator to control the recording action of said mechanism, an auxiliary magnet-coil acting upon said regulator in opposition to said main magnet-coil, and means for locking said mechanism against retrograde motion under the action of the auxiliary magnet-coil when the flow of current is interrupted through the main magnet-coil.

5. In an electric meter, the combination with the recording mechanism, comprising a train of gearing and an electromagnetically-controlled regulator therefor, a main magnet-coil connected with the main circuit from the source of current-supply and acting upon said regulator to control the recording action of said mechanism, means applied to one of the members of the said train of recording mechanism for locking the same from retrograde movement, and means automatically brought into effective action by the interruption of the flow of current in the main circuit for bringing said locking means into operation.

6. In an electric meter, the combination with the recording mechanism, comprising a train of gearing and an electromagnetically-controlled regulator therefor, a main magnet-coil connected with the main circuit from the source of current-supply and acting upon said regulator to control the recording action of said mechanism, means for mechanically preventing the retrograde movement of said recording mechanism, and means for electrically preventing the forward movement of said recording mechanism when the flow of current in the main circuit is interrupted.

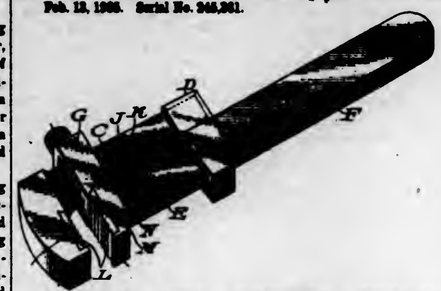
7. In an electric meter, the combination with the recording mechanism, comprising two differential trains of transmission-gearing and a common train of indicating-gearing connected therewith, regulators or escapements for each said train of differential gearing, a pair of main magnet-coils of like polarity each disposed adjacent to one of the said regulators and connected with the main circuit from the source of current-supply, magnet-coils of opposite polarity carried by said regulators, and each connected with a shunt-circuit from said source of current-supply, means applied to said train of indicating mechanism for mechanically locking the same from retrograde movement, and an auxiliary magnet-coil of opposite polarity disposed in juxtaposition to one of said main magnet-coils and also connected with the said shunt-circuit from the source of current-supply.

8. In an electric meter, the combination with a fixed main magnet-coil in the main circuit from the source of current-supply, a primary shunt magnet-coil in a shunt-circuit, a movable member carrying said shunt magnet-coil which is magnetically actuated under the influence of said main magnet-coil, and a train of clockwork recording mechanism connected with said movable member, of a fixed auxiliary shunt magnet-coil of less strength than said main coil and of opposite polarity in respect of the same, and a stop device applied to the recording mechanism for opposing its operation under the action of the auxiliary shunt magnet-coil when the flow of current in the main coil is interrupted.

9. In an electric meter, the combination with a fixed main magnet-coil in the main circuit from the source of current-supply, a primary shunt magnet-coil in a shunt-circuit, a movable member carrying said shunt magnet-coil which is magnetically actuated under the influence of said main magnet-coil, and a train of clockwork recording mechanism connected with said movable member, of a fixed auxiliary shunt-coil of less strength than said main coil and of opposite polarity, and a ratchet and pawl applied to a member of the train of recording mechanism and so disposed as to permit its operation under the influence of the main coil but to resist its reverse movement under the sole action of the auxiliary shunt magnet-coil.

10. In an electric meter, the combination with two main coils in the main circuit from the source of current-supply and two primary shunt magnet-coils, two pendula each carrying one of said shunt magnet-coils, which are each magnetically actuated under the influence of its respective main magnet-coil, and recording mechanism comprising two differentially-acting trains of mechanism each connected with and controlled by one of said pendula, of an auxiliary shunt magnet-coil adjacent one of said main magnet-coils and of opposite polarity, and a stop device applied to said recording mechanism for opposing its operation under the sole action of the auxiliary shunt-coil when the main coil is inactive.

813,686. **WRENCH.** EDWARD ATTEMS, Philadelphia, Pa. Filed Feb. 13, 1905. Serial No. 245,961.



Claim.—1. In a wrench, a stationary jaw, a movable jaw, shanks for said jaws, yokes connected with respective members, the opposing shanks having opposite relative rocking movements, a single tightening device on one yoke to engage the shank carrying the other yoke to bind the parts within said yokes, and a shank-interlocking device intermediate the bearings of said shanks.

2. In a wrench, a stationary jaw having a shank, a movable jaw with a shank, a yoke rigid with each shank, each shank having a rocking fulcrum in the yoke of the other, one of said yokes having inclined walls, means between the yokes for interlocking the shanks, and means on one yoke between the other yoke and the jaw carried by its shank for engaging said shank to rock the parts on the fulcrum in the other yoke to bind the parts at each yoke and at a point between them.

3. In a wrench, a stationary jaw having a shank, a movable jaw with a shank, a yoke rigid with each shank, each shank having a rocking fulcrum in the yoke of the other, one of said yokes having inclined wall, means between the yokes for interlocking the shanks, and means on one yoke between the other yoke and the jaw carried by its shank for engaging said shank to rock the parts on the fulcrum in the other yoke to bind the parts at each yoke and at a point between them, said shank-interlocking means being normally out of engagement.

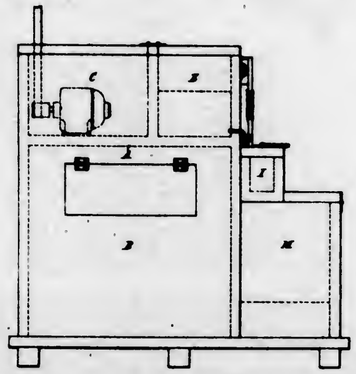
813,687. **WAGON-DUMPING APPARATUS.** DORA E. BARNES, WILLIAM O. BLACKBURN, and ALVA MILLER, Hays, Kans. Filed July 3, 1905. Serial No. 268,106.

Claim.—1. In an apparatus of the class described, the combination of inclined track-rails having vertical stops at the higher ends, a framework extending above the higher ends of said track-rails, a wagon for movement over said track-rails, tackle-blocks having means for detachably coupling to the forward axle of said wagon, tackle-blocks connected to the upper part of said upwardly-extended framework, and draw-cables extending through said tackle-blocks, whereby when power is applied to said draw-cables, the wagon will first be drawn upward upon the track-rails until the rear wheels engage the stop-blocks upon the same and then the forward end of the wagon elevated to cause the discharge of contents.

2. In an apparatus of the class described, a base-frame for movement over the ground, spaced riser members connected at one end to one end of said base-frame and inclined toward the opposite end of the same, spaced brace members connected between the said opposite end of said base-frame and the upper ends of said riser member, spaced track-rails having longitudinal flanges and connected to said base member at one end between said brace members and extending at an incline to the longitudinal plane of the base-frame and connected to said riser members intermediately thereof, stop-blocks at the higher ends of said track-rails, a wagon for movement over said track-rails, tackle-blocks having means for detachably connecting to the forward axle of said wagon, tackle-blocks connected to said riser members, and draw-cables extending through said tackle-blocks.

3. In an apparatus of the class described, the combination of spaced inclined track-rails having vertical steps at the higher ends and with trip members adjacent to said steps, riser members extending above the higher ends of said track-rails, a wagon for movement over said track-rails, tackle-blocks and draw-cables connected between the forward axle of said wagon and said riser members for moving said wagon upon said track-rails until its rear wheels engage said step-blocks and its forward end is elevated, a tail-board swinging outwardly from the body portion of said wagon and provided with laterally-extending arms and latches swinging from said wagon-body portion and detachably engaging said arms and adapted to be released by said trip members when the forward end of the wagon is elevated for discharging the contents.

813,688. APPARATUS FOR PREPARING BLEACHING LIQUOR. FREDERICK L. BARTLEY, Bristol, England. Filed Oct. 7, 1904. Serial No. 227,543.



Claim.—1. An apparatus for preparing bleaching liquor, consisting of a solution-tank, an electrolyzer, and a bleaching-liquor tank, arranged at different levels, in combination with a source of electricity in circuit with the electrolyzer, a bell-circuit and an electrolyzing-circuit, a measuring device in the solution-tank, a float in the solution-tank adapted to close the bell and electrolyzing-circuits and break the main circuit under certain conditions, and outlets of various diameters from the solution-tank to the electrolyzer, all substantially as described.

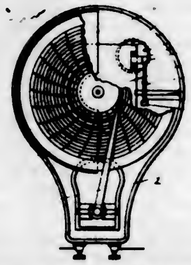
2. An apparatus for preparing bleaching liquor comprising a solution-tank, a float therein, an electrolyzer at a lower level than the tank, and a bleaching-liquor tank below the electrolyzer in combination with a source of electricity in circuit with the electrolyzer, a bell-circuit and an electrolyzing-circuit including a switch adapted to be closed by the float, all substantially as described.

3. Apparatus for preparing bleaching liquor comprising a platform, a solution-tank on said platform and a source of electricity mounted on said platform, a storage-chamber situated under said platform, an electrolyzer below the level of the solution-tank, and a bleaching-liquor tank below the electrolyzer, a main circuit between the source and the electrolyzer, a switch in this circuit, a float in the solution-tank, and an electrolyzing-circuit including a switch adapted to be closed by the float, all substantially as described.

813,689. INDICATING AND RECORDING DEVICE. WILLIAM H. BRISTOL, New York, N. Y. Filed May 6, 1905. Serial No. 259,155.

Claim.—1. In an indicating and recording device, a combined indicating and recording arm, a chart backed or supported over only a portion thereof, the active or unsupported portion being left perfectly free to vibrate whereby the impact between the recording elements is gradually taken up, and means to cause transverse vibrations of one of the recording elements at said active or unsupported portion.

2. In an indicating and recording device, a combined indicating and recording arm, a chart backed or supported over only a portion thereof, the active or unsupported portion being left perfectly free to vibrate whereby the impact between the recording elements is gradually taken up, and means to periodically cause transverse vibrations of one of the recording elements at said active or unsupported portion.



3. In an indicating and recording device, an indicating-arm, a chart backed or supported over only a portion thereof, the active or unsupported portion being left perfectly free to vibrate whereby the impact between the recording elements is gradually taken up and means to independently vibrate said chart at said active or unsupported portion.

4. In an indicating and recording device, an indicating-arm, a chart backed or supported over only a portion thereof, the active or unsupported portion being left perfectly free to vibrate whereby the impact between the recording elements is gradually taken up and means to periodically vibrate said chart at said active or unsupported portion.

5. In an indicating and recording device, an indicating-arm, a smoked chart backed or supported over only a portion thereof, the active or unsupported portion being left perfectly free to vibrate whereby the impact between the recording elements is gradually taken up and means to independently vibrate said chart at said active or unsupported portion.

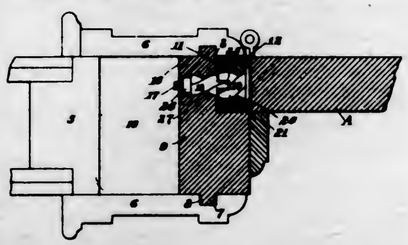
6. In an indicating and recording device, a flattened indicating-arm, a revoluble chart backed or supported over only a portion thereof, the active or unsupported portion being left perfectly free to vibrate whereby the impact between the indicating elements is gradually taken up and means to independently vibrate said chart at said active or unsupported portion.

7. In an indicating and recording device, a flattened indicating-arm provided with a marking-point, a smoked revoluble chart unsupported over its active portion, clock mechanism, a bell-crank, and means in connection with said clock mechanism to vibrate said bell-crank, and means connected to the bell-crank to vibrate said active portions.

8. In an indicating and recording device, an indicating-arm, a chart backed and supported over substantially one-half its surface by a plate, the active portion being unsupported and free to vibrate, clock mechanism to revolve said chart, a bell-crank held in position by a spring, pins or blocks mounted upon a wheel of said clock mechanism and adapted to wipe one arm of said bell-crank causing it to thereby vibrate said chart.

9. In an indicating and recording device, a chart unsupported over its active portion, means to vibrate the active portion of said chart and means to limit the vibration of said active portion of the chart.

813,690. ADJUSTABLE DOOR-JAMB. JOHN R. CORBIN, New York, N. Y. Filed Mar. 17, 1905. Serial No. 250,541.



Claim.—1. The combination with a door-jamb or the like, of a movable strip therefor, and means for adjusting said strip relative to the jamb, such means comprising two members, one secured against rotation in the jamb and the other secured against rotation in the strip, said members being in alinement and having abutting end portions, and a rotating element connecting the two members.

2. The combination with a door-jamb, or the like, of a movable strip mounted in a groove cut in said jamb, said strip having a bore extending therethrough in alinement with a similar bore cut in the jamb, a sleeve member fixedly retained in each bore, and a rotatable element extending through both sleeve members whereby through the rotation of said element said strip may be tightened or loosened in the grooves of the jamb.

3. The combination with a jamb, of a strip designed to be secured thereto, and a device for permitting the adjustment of said strip relative to the jamb, comprising two sleeve portions arranged end to end, a screw-rod extending through said sleeve portions but held against longitudinal movement relative thereto, and means for locking one of said sleeve portions to the other.

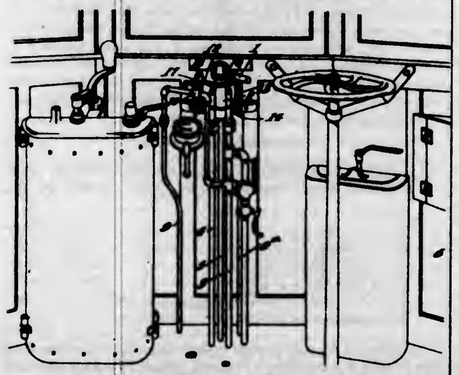
4. An adjusting device for jambs and the like, comprising a strip portion, a tubular sleeve portion embedded in said strip and having a lateral slot cut transversely across the base thereof, a second sleeve portion provided with a reduced shoulder at the end thereof designed to engage said slot, and a screw-rod extending through the sleeve portions and designed to project into the jamb.

5. An adjusting device for jambs and the like, comprising a tubular sleeve portion, a second sleeve portion abutting end to end and adapted to interlock with the first sleeve portion, a screw-rod having its head countersunk in the head of the first-mentioned sleeve portion, and an inwardly-extending flange projecting over the head of the screw-rod to hold such screw-rod against longitudinal movement.

6. The combination with a jamb, of a sleeve portion arranged in a bore formed in said jamb, a second sleeve portion embedded in an adjustable strip arranged adjacent to the jamb, and held against rotation, and adapted to abut end to end with the first-mentioned sleeve portion, and a screw-rod extending through and connecting said sleeve portion substantially as set forth.

7. An adjusting device for jambs, and the like, comprising a strip, an exteriorly-threaded tubular sleeve extending through said strip, an exteriorly-threaded sleeve extending through the jamb, and a rotatable element passing through both of said sleeves.

813,691. BRAKE AND TRACK-SANDING MECHANISM. MURRY A. DE FRANCE, Newark, Ohio, assignor of one-fourth to Albert H. Simon, one-fourth to Charles H. Krebs, and one-fourth to W. Bernard Wingerter, Newark, Ohio. Filed Sept. 7, 1905. Serial No. 277,272.



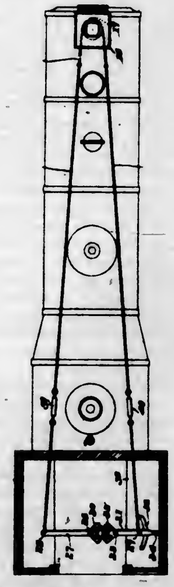
Claim.—1. The combination with track-sanding apparatus and air-brake apparatus, the latter including a brake-valve-actuating handle and the former including a fluid-pressure valve, of a lever mounted independently of said handle and extending contiguous thereto, in the "service," "running," and "on-lap" positions of said handle, in a plane parallel with the movement of said handle and so formed that the hand of the brakeman holds a constant relation to it in the arc of its movement, said lever being designed to actuate the fluid-pressure valve and being provided with a swell in the path of movement of the handle at the "emergency" position.

2. The combination with track-sanding mechanism provided with a fluid-pressure valve, and air-brake mechanism including a brake-lever and handle for actuating the same, of a lever mounted independently of said handle and extending contiguous thereto in a plane parallel with the plane of movement of said handle and through the traverse of the same, said lever being designed to actuate said valve and being provided at each end with a swell extending in the path of movement of said handle and designed to contact therewith in the emergency and release positions of the same.

3. The combination with a track-sanding apparatus including a fluid-pressure valve and an air-brake mechanism including a brake-valve and handle for actuating the same, of a bracket designed to be supported adjacent said handle and independently thereof, and a lever fulcrumed in said bracket at its end and consisting of a curved bar extending from end to end throughout the traverse of said handle and contiguous thereto and in a plane parallel to the plane of movement of said handle, said lever being provided with a projection or lug extending over said fluid-pressure valve, as and for the purpose set forth.

4. The combination with track-sanding mechanism including a fluid-pressure valve and air-brake mechanism including a brake-valve and handle for actuating the same, of a bracket mounted adjacent said handle, and a lever consisting of a curved bar detachably mounted at its ends in said bracket and extending independently of the handle contiguous thereto and in a plane parallel to the plane of movement thereof, said lever being provided at one end with a lug extending over said fluid-pressure valve and designed to actuate the same and being provided near its other end with a swell extending in the path of movement of said handle in the emergency position thereof, as and for the purpose set forth.

813,692. OPERATING HEADLIGHTS OF LOCOMOTIVES. WILLIAM H. DONALDSON, Joliet, Ill. Filed June 20, 1905. Serial No. 266,128.

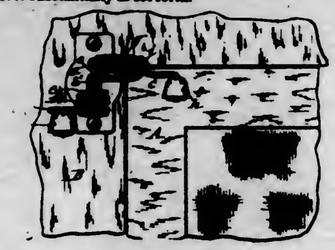


Claim.—In a device of the class described, a pivoted headlight, a primary lever pivoted intermediate its ends, rods connecting said headlight at opposite sides to the ends of the said primary lever, a gear-segment connected to said primary lever and concentric to its pivot, a secondary lever pivoted intermediate its ends, a gear-segment connected to said secondary lever and intermeshing with the gear-segment on said primary lever, a keeper extending beneath said secondary lever and supporting the same and provided with spaced teeth disposed concentric to the pivot of said secondary lever, and a pawl movably connected to said secondary lever and engaging said spaced teeth.

813,693. DOOR CHECK AND CLOSER. EDWARD L. ELLERBE, Catawba, N. Y. Filed Oct. 24, 1904. Serial No. 229,716.

Claim.—The improved door check and closer consisting of an arm rigidly sustained on the door-casing, a door-checking lever and

a door-closing lever rigidly united and fulcrumed on the aforesaid arm, said levers having their free ends adapted to engage respectively opposite sides of the door, and a spring actuating said levers and throwing the free ends thereof alternately into positions to press on the door substantially as set forth.



813,694. AUTOMATIC RIFLE. THEIS A. FERKLAND, Postvedt, Iveland, Norway. Filed Feb. 24, 1904. Serial No. 195,168.

Claim.—1. In an automatic rifle, the combination with the barrel and the breech-block, a pipe in communication with the barrel, a spring-pressed piston-rod therein upon which the powder-gases act, a cam on said rod, a substantially helical groove on the outer side of the breech-bock which groove said cam engages, locking-stops on the breech-block, a longitudinal guiding-passage in the frame, into which passage said stops travel during the reciprocating movement of the breech-block thereby preventing the block to be turned during such movement, an end face 45 of the helical groove against which face the cam bears during the rearward movement of the breech-block, a flat face 46 in the rear part of the helical groove against which face 46 the front end of the cam bears during the forward movement of the breech-block without causing any turning action on the same, and an inclined plane 24 provided on the frame of the rifle and located in the path of the foremost locking-stop and acting on the same at the last part of the forward movement of the breech-block, which is thereby turned sufficiently to remove the flat face 46 from the cam and enable the latter to reënter the helical groove in order to lock the breech-block.

2. In an automatic firearm, the breech-block having a substantially helical groove therein and locking-stops thereon, the pipe in communication with the barrel, a piston-rod in the pipe having a cam thereon, a passage 12 in the rear of the rifle-casing forming an extension of the pipe, said passage opening into the casing containing the breech-block, a spring in said passage acting upon the piston-rod, the said cam engaging with the slot in the breech-block when the piston-rod operates, an end face 45 of the helical groove against which face the cam bears during the rearward movement of the breech-block, a flat face 46 in the rear part of the helical groove against which face 46 the front end of the cam bears during the forward movement of the breech-block without causing any turning action on the same, and an inclined plane 24 provided on the frame of the rifle and located in the path of the foremost locking-stop and acting on the same at the last part of the forward movement of the breech-block, which is thereby turned sufficiently to remove the flat face 46 from the cam and enable the latter to reënter the helical groove in order to lock the breech-block.

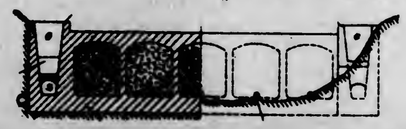
3. In an automatic firearm, the breech-block having a substantially helical groove therein and locking-stops thereon, the pipe in communication with the barrel, a piston-rod in the pipe having a cam thereon, a passage 12 in the rear of the rifle-casing forming an extension of the pipe, said passage opening into the casing containing the breech-block, a spring in said passage acting upon the piston-rod, the said cam engaging with the slot in the breech-block when the piston-rod operates, an end face 45 of the helical groove against which face the cam bears during the rearward movement of the breech-block, a flat face 46 in the rear part of the helical groove against which face 46 the front end of the cam bears during the forward movement of the breech-block without causing any turning action on the same, and an inclined plane 24 provided on the frame of the rifle and located in the path of the foremost locking-stop and acting on the same at the last part of the forward movement of the breech-block, which is thereby turned sufficiently to remove the flat face 46 from the cam and enable the latter to reënter the helical groove in order to lock the breech-block, a longitudinal guiding-passage in the frame, into which passage said stops travel during the reciprocating movement of the breech-block thereby preventing the block to be turned during such movement, an end face 45 of the helical groove against which face the cam bears during the rearward movement of the breech-block, a flat face 46 in the rear part of the helical groove against which face 46 the front end of the cam bears during the forward movement of the breech-block without causing any turning action on the same, and an inclined plane 24 provided on the frame of the rifle and located in the path of the foremost locking-stop and acting on the same at the last part of the forward movement of the breech-block, which is thereby turned sufficiently to remove the flat face 46 from the cam and enable the latter to reënter the helical groove in order to lock the breech-block.

4. In an automatic firearm the breech-block having a groove therein and working in a passage forming an extension of the barrel, a pipe in communication with the barrel, a piston-rod in the pipe having a cam thereon projecting into said groove, a passage 12 in the rear of the rifle-casing forming an extension of the pipe, and a rear piece 16 screwed into the rear of the rifle-frame in order to close the end of said breech-block passage and having a nose 15 forming an extension of said rear piece and closing the rear end of said piston-rod passage 12.

5. In an automatic firearm the breech-block having a substantially helical groove therein and locking-stops thereon and working in a passage forming an extension of the barrel, the pipe in communication with the barrel, a piston-rod in the pipe having a cam thereon, a passage 12 in the rear of the rifle-casing forming an extension of the pipe, said passage 12 opening into the passage containing the breech-block, a rear piece 16 screwed into the rear of the rifle-frame in order to close the end of said breech-block passage and having a nose 15 forming an extension of said rear piece and closing the rear end of said passage 12, two removable pins, securing said rear piece 16 in position, a spring in the passage 12 acting upon the piston-rod, the said cam engaging with the slot in the breech-block when the piston-rod operates, an end face 45 of the helical groove against which face the cam bears during the rearward movement of the breech-block, a flat face 46 in the rear part of the helical groove against which face 46 the front end of the cam bears during the forward movement of the breech-block without causing any turning action on the same, and an inclined plane 24 provided on the frame of the rifle and located in the path of the foremost locking-stop and acting on the same at the last part of the forward movement of the breech-block, which is thereby turned sufficiently to remove the flat face 46 from the cam and enable the latter to reënter the helical groove in order to lock the breech-block.

6. In an automatic firearm, the barrel, the breech-block having the groove therein, the pipe in communication with the barrel, the spring-pressed piston-rod in the pipe having the cam thereon engaging with the groove, said rod also having the stud on one side thereof, a casing forming a continuation of the pipe, a slide moving longitudinally in said casing, a nose on said slide, said nose engaging with the stud on the piston-rod so that the rod will move with the slide and means for releasing said nose from the stud.

813,695. DAM, RETAINING-WALL, OR BREAKWATER. JOHN S. FERLAND, Toronto, Canada. Filed Jan. 16, 1905. Serial No. 241,245.



Claim.—1. An improvement in dams, retaining-walls and other like structures, comprising a base and vertical face-walls united to the base constructed of non-erosive material, a filling of inexpensive material contained between the face-walls, and abutments at the ends of the face-walls constructed of like material having therein chambers filled with an inexpensive material.

2. An improvement in dams, retaining-walls and other like structures, comprising a base and vertical face-walls united to the base constructed of non-erosive material, a filling of inexpensive material contained between the face-walls, and abutments at the ends of the face-walls having vertical chambers adjoining the reservoir fitted with sluice-gates, and water-ducts to carry away the water from the chambers to the downstream.

3. An improvement in dams, retaining-walls and other like structures, comprising a base and vertical face-walls united to the base constructed of non-erosive material, a filling of inexpensive material contained between the face-walls, abutments at the ends of the face-walls having vertical chambers adjoining the reservoir fitted with sluice-gates, water-ducts to carry away the water from the chambers to the downstream, and drains along the outer faces of the abutment-walls.

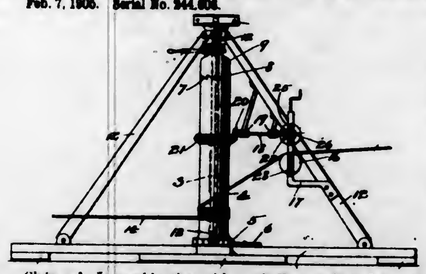
4. An improvement in dams, retaining-walls and other like structures, comprising a base and vertical face-walls united to the base constructed of non-erosive material, a filling of inexpensive material contained between the face-walls, abutments at the ends of the face-walls having vertical chambers adjoining the reservoir fitted with sluice-gates, water-ducts to carry away the water from the chambers to the downstream, and other chambers in the abutments filled with inexpensive material.

5. An improvement in dams, retaining-walls and other like structures comprising a base and vertical face-walls united to the base constructed of non-erosive material, a filling of inexpensive material contained between the face-walls, abutments at the ends of the face-walls having vertical chambers adjoining the reservoir fitted with sluice-gates, water-ducts to carry away the water from the chambers to the downstream, other chambers in the abutments filled with inexpensive material and drains along the outer faces of the abutment-walls.

6. An improvement in dams, retaining-walls and other like structures comprising a base and vertical face-walls united to the base constructed of non-erosive material, the upstream face-wall having inlet-openings through which the water from the reservoir may enter the space between the face-walls.

7. An improvement in dams, retaining-walls and other like structures, comprising a base, vertical face-walls united to the base and cross-walls bracing the face-walls intermediate their ends constructed of non-erosive material, the upstream face-wall having inlet-openings through which the water from the reservoir may enter the space between the face-walls.

813,696. STUMP-PULLER. JOHN K. FLYNN, Duluth, Minn. Filed Feb. 7, 1905. Serial No. 244,606.



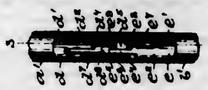
Claim.—1. In combination with a windlass, rods to brace the top of the windlass, a sheave journaled on one of said rods, said windlass and sheave geared for simultaneous operation, and another sheave adjustably mounted relative to said journaled sheave, substantially as shown and described.

2. In combination with a windlass, rods to brace the top of the windlass, an angular brace secured to one of said rods, a sheave journaled in said rod and angular brace, said sheave and windlass geared together for simultaneous operation, a U-shaped brace adjustably mounted on said angular brace, and a sheave journaled in said U-shaped brace, substantially as shown and described.

3. In combination with a windlass, rods to brace the top of the windlass, an angular brace secured to one of said rods having a slot therein, a sheave journaled on said rod and angular brace, beveled gear-faces on said windlass and sheave, a shaft having beveled gear-pinions on its ends to mesh with the respective gear-faces, a U-shaped brace having slots therein in which are mounted the ends of the axis of the sheave aforesaid, a sheave journaled in said U-shaped brace having its axis extending through the slot in the angular brace, and a set-screw secured in said U-shaped brace and bearing against the angular brace to adjust the sheave journaled in the U-shaped brace relative to the other sheave, substantially as shown and described.

813,697. BRACELET. THEODORE W. PEGRAM, Providence, R. I. Filed Dec. 6, 1905. Serial No. 290,889.

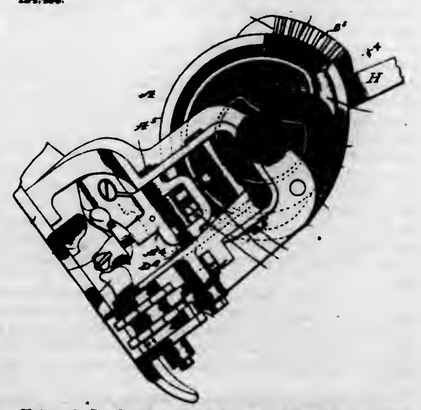
Claim.—1. In a hinged bracelet, a concealed hinge comprising a member having a solid end from which extends a rigid arm having a hook-shaped end, and a spring side arm extending from the solid end parallel with the rigid arm, and a member having a solid end from which extends a rigid arm, a pin secured transversely in the rigid arm adjacent its end and a spring side arm extending from the solid end parallel with the rigid arm, said members being provided with means for limiting the opening movement of the hinge and means for securing the members of the hinge in the bracelet.



2. A concealed bracelet-hinge comprising a member *d* having a solid end *d'* from which extends a rigid portion d^3 reduced in thickness to form an arm d^4 having the hook-shaped end d^5 thickened on its inner face to form a stop-shoulder d^6, and a spring side arm d^7 extending from the solid end *d'* parallel with the rigid arm d^4 and forming a central opening d^8, and a member *e* having a solid end *e'* from which extends a rigid portion e^3 reduced in thickness to form an arm e^4 having the end e^5 thickened on its inner face to form a stop-shoulder e^6, a spring side arm e^7 extending from the solid end *e'* parallel with the rigid arm e^4 and forming a central opening e^8 and a transverse pin e^9 secured in the arm e^4 adjacent the end e^5 and across the opening e^8, and means for securing the members *d* and *e* of the hinge in a bracelet.

3. The combination with a tubular half *a* having the end *a'* and a tubular half *b* having the end *b'* of a bracelet, of a concealed hinge *c* composed of a member *d* having a solid end *d'* from which extends a rigid portion d^3 reduced in thickness to form an arm d^4 having a hook-shaped end d^5 thickened on its inner face to form a stop-shoulder d^6 and a spring side arm d^7 extending from the end *d'* parallel with the arm d^4 and forming a central opening d^8 and a member *e* having a solid end *e'* from which extends a rigid portion e^3 reduced in thickness to form an arm e^4 having the end e^5 thickened on its inner face to form a stop-shoulder e^6, a spring side arm e^7 extending from the solid end *e'* parallel with the arm e^4 and forming a central opening e^8, and a transverse pin e^9 secured in the arm e^4 adjacent the end e^5 and across the opening e^8, and means for securing the members *d* and *e* of the hinge in the ends *a'* and *b'* of the bracelet.

813,698. KNOTTER MECHANISM FOR GRAIN-BINDERS. PAUL HANSON, St. Paul, Minn. Filed Sept. 22, 1902. Serial No. 124,426.



Claim.—1. In a knotter mechanism for grain-binders, a knotter-operating wheel, a knotter-bill, a frame in which said knotter-bill is mounted, a pinion for operating said knotter-bill, said frame being hinged or pivoted upon an axis, between which and said operating-wheel the pinion is located, and means for swinging said frame, as and for the purpose set forth.

2. In a knotter mechanism for grain-binders, a knotter-bill, a shaft carrying the same, a frame in which said shaft is journaled, said frame being hinged or pivoted, a pinion mounted upon said shaft, a knotter-operating wheel having gear-teeth with which said pinion cooperates to actuate said knotter-bill, said pinion being arranged between said cam-wheel and the pivotal axis of said frame; all combined and arranged as and for the purpose set forth.

3. In a knotter mechanism for grain-binders, a knotter-bill and

its supporting-shaft, a frame in which said shaft is journaled, a pinion mounted upon said shaft, a cam-wheel having gear-teeth with which said pinion coöperates, said frame being hinged or pivoted upon an axis arranged over the point of operation of said knotter-bill, said pinion being arranged between the cam-wheel and the axis upon which said frame is hinged or pivoted, said cam-wheel provided with an enlargement arranged to engage said frame to rock the same, all combined and arranged as and for the purpose set forth.

4. In a knotter mechanism for grain-binders, a knotter-bill, a shaft carrying the same, a frame in which said shaft is journaled, a pinion mounted on said shaft, a cam-wheel, and a flange formed on said frame and arranged to engage said cam-wheel, said frame being pivotally mounted upon an axis arranged to one side of said pinion, said pinion being arranged between the cam-wheel and the axis upon which said frame is pivoted, said flange being arranged above said axis; all combined and arranged as and for the purpose set forth.

5. In a knotter mechanism for grain-binders, a knotter-bill, a pivotally-mounted frame in which said knotter-bill is mounted, a pinion for operating said knotter-bill, an operating cam-wheel having a track in the face thereof, a flange carried by said frame and arranged to operate in said track, and a guiding-lug carried by said pinion and engaging the outer rim of said wheel when said frame is rocked to one limit of its swinging movement; all combined and arranged as and for the purpose set forth.

6. In a knotter mechanism for grain-binders, a knotter-bill, a shaft therefor, a pinion mounted on said shaft, a frame in which said shaft is mounted, said frame being hinged or pivoted, a cam-wheel having gear-teeth, said pinion being located between said cam-wheel and the axis upon which said frame is pivoted, a lug formed on said pinion and arranged to engage the rim of said wheel to form a guide for said pinion when said frame is rocked to one limit of its movement, a shoulder formed on said cam-wheel adjacent to the gear-teeth thereon and arranged to be engaged by the lug on said pinion to throw said pinion into mesh with the gear-teeth on said cam-wheel, said cam-wheel also operating to engage said frame to rock the same; as and for the purpose set forth.

7. In a knotter mechanism for grain-binders, a knotter-bill, a shaft, a frame in which said shaft is mounted, said frame being pivotally supported, a pinion mounted upon said shaft, an operating-wheel having gear-teeth, a flange formed on said frame, a ridge formed on said wheel adjacent to said gear-teeth, and with which said flange engages to lock said pinion and gear-teeth in mesh with each other during the rotation of said pinion, as and for the purpose set forth.

8. In a grain-binder, and in combination with a needle and packers and means for operating the same, of a knotter mechanism including a knotter-operating wheel, said wheel provided with gear-teeth for a portion of the face thereof and having a delay-surface and a trackway formed in the face thereof, said delay-surface being formed into an enlargement, a knotter-bill, a swinging frame in which said bill is mounted, a pinion for actuating said knotter-bill, and with which said rack-teeth coöperate, said pinion having a planed surface to coöperate with the delay-surface on said cam-wheel, said swinging frame having a flange arranged to operate in the trackway in the face of said cam-wheel and the planed surface on the pinion adapted to be engaged by the enlargement on the delay-surface in said cam-wheel to rock said frame, as and for the purpose set forth.

9. In a knotter mechanism for grain-binders, a knotter-bill, means for actuating the same, a swinging frame in which said knotter-bill is mounted, a cord-clamp, a swinging arm for actuating the same, a severing-cutter carried by said arm, and means for swinging said arm and frame in opposite directions, as and for the purpose set forth.

10. In a knotter mechanism for grain-binders, a knotter-bill and means for operating the same, a swinging frame in which said bill is mounted, a cord-clamping block, a severing-cutter operating past the face of said block to sever the cord or twine, and means for moving said severing-cutter in a direction opposite to that in which said knotter-bill frame swings, as and for the purpose set forth.

11. In a knotter mechanism for grain-binders, a knotter-bill and means for actuating the same, a swinging frame in which said knotter-bill is mounted, a stripper operating to strip the knot from said knotter-bill, and means for moving said stripper and swinging said frame in opposite directions, as and for the purpose set forth.

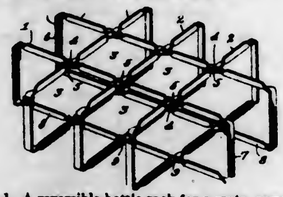
12. In a knotter mechanism for grain-binders, a knotter-bill and means for operating the same, a swinging frame in which said knotter-bill is mounted, a stripper, a swinging arm carrying said stripper, and means for swinging or operating said arm and frame coincidently and in opposite directions, as and for the purpose set forth.

13. In a knotter mechanism for grain-binders, a knotter-bill and means for operating the same, a swinging frame in which said knotter-bill is mounted, a stripper, a swinging arm carrying said stripper, means for swinging said frame into position to point the knotter-bill downwardly, and means for coincidently swinging said stripper-arm in the opposite direction to strip the knot from the bill, as and for the purpose set forth.

14. In a knotter mechanism for grain-binders, a knotter-bill and means for actuating the same, a swinging frame in which said knotter-bill is mounted, a cord-clamp block, a pivotally-mounted knife-arm, a severing-blade carried thereby and coöperating with said clamp-block to sever the cord, a stripper also mounted upon said arm, and means for moving said stripper and knife-blade and said swinging frame in opposite directions, as and for the purpose set forth.

15. In a knotter mechanism for grain-binders, the combination with a needle and its operating mechanism, a breastplate having an opening through which said needle operates, a knot-forming mechanism including a knotter-bill, a supporting-frame therefor, means for rocking said frame transversely across the slot in said breastplate, and a shoulder or projection formed on said breastplate and arranged to project toward the path of movement of said knotter-bill when said supporting-frame is rocked, said shoulder or projection operating to clear the knotter-bill of entangled twine in case of failure of the knot-forming mechanism to tie a knot, as and for the purpose set forth.

813,699. BOTTLE-CRATE. ROBERT M. HARROVER, Washington, D. C. Filed Apr. 7, 1905. Serial No. 254,342.



Claim.—1. A reversible bottle-rack for a crate, comprising upper and lower sets of transverse and longitudinal bars, the bars in each set crossing each other in spaced relation to provide pockets for the bottles, the bars in one set being in vertical alinement and parallel to the corresponding bars in the other set, and the ends of the bars of the upper and lower sets being connected by legs or supports whereby the said sets are maintained in spaced relation.

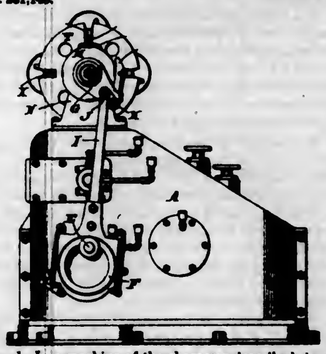
2. A reversible bottle-rack for a crate comprising upper and lower sets of transverse and longitudinal cross-bars, the bars in each set crossing each other in spaced parallel relation to provide pockets for the bottles, the bars in one set being in vertical alinement with and parallel to the corresponding bars in the other set, the corresponding alining bars in the upper and lower set being formed of a single band of metal bent to form said bars and vertical supports or legs connecting the ends of said bars.

3. A reversible bottle-rack of skeleton form, consisting of a plurality of endless loops each formed from a single strand of metal, said loops being arranged in spaced parallel relation and some of which are located at right angles to and overlap others, whereby to provide a plurality of cells, and the strands of said loops being rigidly connected at their points of intersection.

813,700. SIGNAL-LAMP. JOSEPH KIENNER, Topeka, Kans. Filed May 1, 1903. Serial No. 255,262.

Claim.—In a lamp of the class described, the combination of a tubular lamp-body, a separate metallic thickened strengthening-ring secured to the lower portion of the lamp-body said ring provided with an integral solid flaring annular flange on its lower edge extending below the lower edge of the lamp-body and with integral upwardly-extending perforated lugs on its upper edge, and means for securing the lugs to the lamp-body.

813,701. MACHINE FOR MAKING TUBES FROM PULP, PAPER, OR SIMILAR MATERIAL. WALTER B. HOYT, Whitington, Del., assignor to The E. I. Du Pont de Nemours Powder Company, Wilmington, Del., a Corporation of New Jersey. Filed May 19, 1905. Serial No. 261,148.



Claim.—1. In a machine of the character described, in combination, a couch-roll, a winding-roll adapted to receive the pulp or paper from the couch-roll, mechanism to move said roll away from operative relation with the couch-roll, said mechanism being normally inactive, and means whereby by reason of the winding-roll receiving a predetermined amount of pulp or paper, said mechanism becomes active.

2. In a machine of the character described, in combination, a couch-roll, a winding-roll adapted to receive the pulp or paper from the couch-roll, mechanism to move said roll away from operative relation with the couch-roll, said mechanism being normally inactive, means whereby, by reason of the winding-roll receiving a predetermined amount of pulp or paper, said mechanism becomes active, and means operated by the winding-rolls to again render said mechanism inactive.

3. In a machine of the character described, in combination, a couch-roll, a plurality of winding-rolls adapted to be moved successively in operative position with reference to the couch-roll, mechanism, normally inactive, to move said winding-rolls, means adapted to render said mechanism active by reason of the active winding-roll receiving a predetermined amount of pulp or paper.

4. In a machine of the character described, in combination, a couch-roll, a plurality of winding-rolls adapted to be moved successively in operative position with reference to the couch-roll, mechanism, normally inactive, to move said winding-rolls, means adapted to render said mechanism active by reason of the active winding-roll receiving a predetermined amount of pulp or paper, and means operated by the winding-rolls to again render said mechanism inactive.

5. In a machine of the character described, in combination, a couch-roll, a plurality of winding-rolls, means to move said winding-rolls one by one into operative position with respect to the couch-roll, and locking mechanism adapted to directly hold the operative winding-roll from movement beyond operative position with respect to the couch-roll.

6. In a machine of the character described, in combination, a couch-roll, a plurality of winding-rolls, means to move said winding-rolls one by one into operative position with respect to the couch-roll, and locking mechanism adapted to directly hold the operative winding-roll from movement in either direction from operative position with respect to the couch-roll.

7. In a machine of the character described, in combination, a couch-roll, a plurality of winding-rolls, means to move said winding-rolls one by one into operative position with respect to the couch-roll, and locking mechanism adapted to hold the operative winding-roll from movement beyond operative position with respect to the couch-roll, said winding-roll being released from said locking means by reason of a predetermined amount of pulp or paper being laid upon said roll.

8. In a machine of the character described, in combination, a couch-roll, a plurality of winding-rolls, means to move said rolls one by one into operative position with respect to said couch-roll, a locking device adjacent to said couch-roll in line of movement of the winding-rolls and adapted to yield in the movement of the winding-roll toward the operative position with respect to the couch-roll and allow said roll to pass beyond said locking device.

9. In a machine of the character described, in combination, a couch-roll, a plurality of winding-rolls, means to move said rolls one by one into operative position with respect to the couch-roll, each winding-roll being supported so as to be independently vertically movable, and a stop in line of movement of said winding-rolls in one vertical position of said rolls, and out of line at another vertical position of said rolls.

10. In a machine of the character described, in combination, a couch-roll, winding-rolls, a support or supports in which said rolls are independently secured, a shaft for operating said supports, a rack and pawl for operating said shaft, a cam adapted in one position to render said pawl inoperative, and means during the movement of said winding-rolls to move and hold said cam in said position, and means to release said cam when the operative winding-roll receives a predetermined amount of pulp or paper.

11. In a machine of the character described, in combination, a couch-roll, winding-rolls, a support or supports in which said rolls are independently secured, a shaft for operating said supports, means to operate said shaft, a device adapted to render said means inactive, means, during the movement of the winding-roll, to throw said device into action, and means to throw said device out of action when the operative winding-roll receives a predetermined amount of pulp or paper.

12. In a machine of the character described, in combination, a couch-roll, winding-rolls, a support or supports in which said rolls are independently secured, a shaft for operating said supports, a rack and pawl for operating said shaft, a cam adapted in one position to render said pawl inoperative, a spring tending to hold said cam in the other position, a lever, connected with said cam, in line of movement of the winding-rolls and adapted, when struck, to move said cam to the first-mentioned position.

13. In a machine of the character described, in combination, a couch-roll, winding-rolls, a support or supports in which said rolls are independently secured, a shaft for operating said supports, a rack and pawl for operating said shaft, a cam adapted in one position to render said pawl inoperative, a spring tending to hold said cam in the other position, a lever, connected with said cam, in line of movement of the winding-rolls and adapted, when struck, to move said cam to the first-mentioned position, and a stop, adapted to hold it in said position, controlled by the winding-roll in operative relation with the couch-roll.

14. In a machine of the character described, in combination, a couch-roll, winding-rolls, a support or supports in which said rolls are independently secured, a shaft for operating said supports, a rack and pawl for operating said shaft, a cam adapted in one position to render said pawl inoperative, a spring tending to hold said cam in the other position, a lever, connected with said cam, in line of movement of the winding-rolls and adapted, when struck, to move said cam to the first-mentioned position, a stop, adapted to hold it in said position, controlled by the winding-roll in operative relation with the couch-roll, and means to release said stop when said winding-roll receives a predetermined amount of pulp or paper.

15. In a machine of the character described, in combination, a couch-roll, winding-rolls, a support or supports in which said rolls are independently secured, a shaft for operating said supports, a rack and pawl for operating said shaft, a cam adapted in one position to render said pawl inoperative, a spring tending to hold said cam in the other position, a lever, connected with said cam, in line of movement of the winding-rolls and adapted, when struck, to move said cam to the first-mentioned position, a stop adapted to hold it in said position, said winding-rolls being supported so as to be vertically movable, said stop being controlled by the winding-roll in operative relation with the couch-roll in one vertical position and released in another vertical position.

16. In a machine of the character described, in combination, a winding-roll, supports for the opposite ends of said roll, said roll being pivotally secured in one support and adapted to move free from the other support.

17. In a machine of the character described, in combination, a winding-roll, supports for the opposite ends of said roll, said roll being pivotally secured in one support and adapted to move free from the other support, and means to normally restrain the movement of the roll at said last-mentioned end.

18. In a machine of the character described, in combination, a winding-roll, a shaft therefor projecting beyond the roll ends, a support for each end of said shaft, said shaft being pivoted in one support and adapted to move free from the other support.

19. In a machine of the character described, in combination, a winding-roll a shaft therefor projecting beyond the roll ends, a sup-

port for each end of said shaft, said shaft being pivoted in one support and adapted to move free from the other support, and means to

5. In a machine of the character described, in combination, the

suitably-supported hook-engaging pins one of said pins being adapt-

813,705. BRAKE-BEAM. CHARLES P. HUNTOON, Chicago, Ill., as-

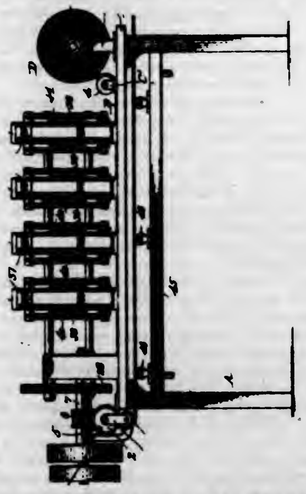
port for each end of said shaft, said shaft being pivoted in one support and adapted to move free from the other support, and means to normally restrain the free movement of said shaft.

20. In a machine of the character described, in combination, a winding-roll, a shaft therefor, projecting beyond the ends of said roll, a frame having a slotted and cut-away portion, a block in said slotted portion, said shaft being pivotally connected to said block, a support for the opposite end of the shaft on which the shaft is free to move.

21. In a machine of the character described, in combination, a winding-roll, a shaft therefor, projecting beyond the ends of said roll, a frame having a slotted and cut-away portion, a block in said slotted portion, said shaft being pivotally connected to said block, a stop limiting the movement of said shaft on its pivot in one direction, a support for the opposite end of the shaft in which the shaft is free to move.

22. In a machine of the character described, in combination, a winding-roll, a shaft therefor, projecting beyond the ends of said roll, a frame having a slotted and cut-away portion, a block in said slotted portion, said shaft being pivotally connected to said block, a support for the opposite end of the shaft on which the shaft is free to move, and a latch for limiting the free movement of said shaft.

813,702. **PRINTING-MACHINE.** BENJAMIN B. HOUGH, Philadelphia, Pa., assignor of one-half to Andrew Forbes, Philadelphia, Pa. Filed Dec. 9, 1904. Serial No. 236,121.



Claim.—1. In a machine of the character described, the combination with the supporting-table having paper-roll supports at one end and draw-rolls at the other end, a plurality of reciprocating plungers carrying type-forms arranged in alinement between the roll-supports and draw-rolls, inking mechanism for each plunger, a main shaft having a worm and gear wheel, parallel shafts geared directly to the main shaft and directly actuating respectively the plungers and inking devices; the actuating-roll of the draw-rolls having a worm-wheel meshing with the worm of the main shaft.

2. In a machine of the character described, in combination, a supporting-table having roll-supporting devices at one end and draw-rolls at the other end, printing mechanism located intermediate the roll-support and draw-rolls, and means beneath the table for drying the freshly-printed article after it leaves the draw-rolls.

3. In a machine of the character described, in combination, the columns arranged in pairs, crank-shafts journaled therein, plungers actuated by said shafts and provided at their lower ends with guide-grooves, an ink-well and distributing-rolls carried by the several columns, a traveling ink-roll the frame of which is provided with studs adapted to traverse the grooves of the plunger, and means for actuating said traveling ink-roll.

4. In a machine of the character described, in combination, the columns arranged in pairs, crank-shafts journaled therein, plungers actuated by said shafts, an ink-well and distributing-rolls, a traveling ink-roll, and means for actuating said traveling ink-roll from the plunger.

5. In a machine of the character described, in combination, the columns arranged in pairs, crank-shafts journaled therein, plungers actuated by said shafts, an ink-well and supply-roll, a traveling ink-roll, and means for actuating said traveling ink-roll and supply-roll from the plunger.

6. In a machine of the character described, in combination, the columns arranged in pairs, crank-shafts journaled therein, plungers actuated by said shafts and provided at their lower ends with guide-grooves, an ink-well and distributing-rolls carried by the several columns, a traveling ink-roll the frame of which is provided with studs adapted to traverse the grooves of the plunger, and means for actuating said traveling ink-roll from the plunger.

7. In a machine of the character described, in combination, the columns arranged in pairs, crank-shafts journaled therein, plungers actuated by said shafts and provided at their lower ends with guide-grooves, an ink-well and distributing-rolls carried by the several columns, a traveling ink-roll the frame of which is provided with studs adapted to traverse the grooves of the plunger, a rock-shaft journaled on the column and carrying geared segments and arms, a shaft journaled beneath the rock-shaft carrying gear-wheels and pinions, rack-bars sliding in ways on the cloumn and means carried by the plunger to actuate the rack-bar.

8. In a machine of the character described, in combination, the columns arranged in pairs, crank-shafts journaled therein, plungers actuated by said shafts and provided at their lower ends with guide-grooves, an ink-well and distributing-rolls carried by each of the several columns, a traveling ink-roll the frame of which is provided with studs adapted to traverse the grooves of the plunger, a rock-shaft journaled on the column and carrying geared segments and arms, a shaft journaled beneath the rock-shaft carrying gear-wheels and pinions, rack-bars sliding in ways on the columns, a spring-pressed bolt carried by the plunger to engage the rack-bars, a latch pivoted to the plunger and to the bolt, and a fixed stud supported by the column to engage the latch.

9. In a machine of the character described, in combination, the columns arranged in pairs, crank-shafts journaled therein, plungers actuated by said shafts and provided with guide-grooves, a traveling ink-roll the frame of which is provided with studs adapted to traverse the grooves of the plunger, an ink-well and supply-roll carried by each of the several columns and means for actuating said roll from the plungers.

10. In a machine of the character described, in combination, the columns arranged in pairs, crank-shafts journaled therein, plungers actuated by said shafts and provided with guide-grooves, a traveling ink-roll the frame of which is provided with studs adapted to traverse the grooves of the plunger, an ink-well and supply-roll carried by each of the several columns, means for actuating said roll from the plungers, a pivoted frame carrying distributing-rolls, and means for actuating the frame on its pivot.

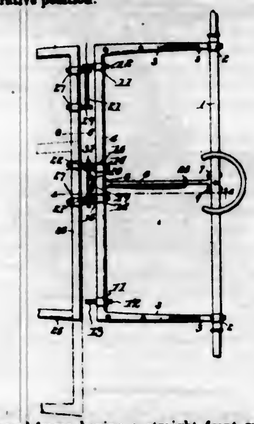
11. In a machine of the character described, in combination, the columns arranged in pairs, crank-shafts journaled therein, plungers actuated by said shafts and provided with guide-grooves, a traveling ink-roll the frame of which is provided with studs adapted to traverse the grooves of the plunger, an ink-well and supply-roll carried by each of the several columns, means for actuating said roll from the plungers, a friction-wheel actuated from the main shaft, a pivoted frame carrying distributing-rolls one of which has an extended shaft provided with a friction-wheel, and a spring to actuate the frame on its pivot.

813,708. **SHAFT AND POLE COUPLING FOR VEHICLES.** WILLIAM HULLEMEAN, Independence, Iowa. Filed Aug. 18, 1905. Serial No. 274,787.

Claim.—1. A hound-frame including a straight front member and end members connecting said front member with and supporting it above the horizontal plane of a vehicle-axle, an auxiliary intermediate brace connecting said front member with the axle, clip-plates connected with the front member and having terminal hooks at their front ends, and a resilient lever having a terminal front hook and supporting-plate and a terminal rear hook adapted to engage the auxiliary brace.

2. A hound-frame having clip-plates provided with terminal hooks, a draft element having clip members provided with hook-engaging pins, a securing member consisting of a suitably-supported resilient lever having a pin-engaging hook, and means for securing the free end of the lever in locked position.

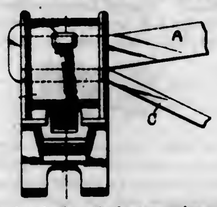
3. A hound-frame having clip-plates provided with terminal hooks, a locking-lever associated with said clip-plates and having a terminal front hook and a supporting-plate, a draft element having suitably-supported hook-engaging pins one of said pins being adapted for engagement with the locking-lever between the hook and the supporting-plate of the latter, and means for securing the locking-lever in operative position.



4. A hound-frame having a straight front member provided with a plurality of clip members including plates having front terminal hooks and eyes, a draft element having a plurality of supporting members, pins supported by said members and adapted for interchangeable engagement with the hooks and eyes supported by the front hound member, and means for effecting a locking engagement between said pins and hooks.

5. A hound-frame including a front member supported above and in front of a vehicle-axle, clip-plates connected with said front member and having front terminal hooks, a draft element having a supported pin for engagement with said front terminal hooks, a lever having a pin-engaging end including a hook and a supporting-plate, the latter constituting an ejector, and means for securing said lever in engaging position.

813,704. **BRAKE-BEAM.** CHARLES F. HUNTOON, Chicago, Ill., assignor to Chicago Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed July 13, 1905. Serial No. 270,171.



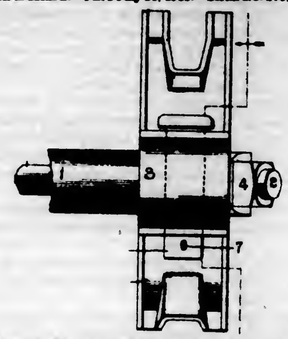
Claim.—1. The herein-described compression member for brake-beams, the same being transversely grooved at its ends to receive a locking-key for holding the brake-head in position; substantially as described.

2. The combination with a compression member having a groove in its end, of a tension member bent around the end of said compression member and forming one wall of said groove, a brake-head having openings designed to register with said groove, and a member passing through the openings in the brake-head and their alining groove; substantially as described.

3. In a trussed brake-beam, the combination of a compression member and a tension member, one of said parts having a groove, and a sleeved brake-head fitting over the ends of said compression and tension members and having openings designed to register with said groove, and a member passing through the openings in the brake-head and said alining groove; substantially as described.

4. In a trussed brake-beam, the combination of a compression member and a tension member bent around the ends of said compression member, one of said parts being formed with a groove, a brake-head having openings designed to register with said groove, and a member passing through the openings in the brake-head and said alining groove; substantially as described.

813,705. **BRAKE-BEAM.** CHARLES F. HUNTOON, Chicago, Ill., assignor to Chicago Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed July 13, 1905. Serial No. 270,173.



Claim.—1. In a trussed brake-beam, the combination with a thrust-block having a tapered opening, of a removable brake-head provided with registering openings, and a tapered wedge-key passing through said openings for securing said removable brake-head in position; substantially as described.

2. In a trussed brake-beam, the combination with a thrust-block having inclined faces, of a removable brake-head fitting upon said thrust-block, and a securing device which tends to more firmly seat the brake-head in position; substantially as described.

3. The herein-described thrust-block for brake-beams, the same having a tapered opening for the reception of a brake-head-securing key; substantially as described.

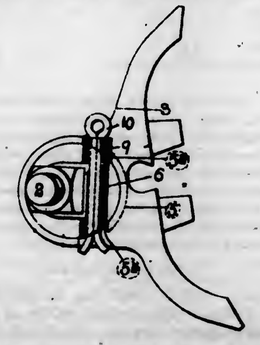
4. The herein-described thrust-block, the same having tapered faces adapted to be embraced by correspondingly-shaped parts on a brake-head; substantially as described.

5. The herein-described brake-head, the same being provided with rearwardly-extending flanges having tapered faces for embracing a correspondingly-shaped part on which it is seated; substantially as described.

6. The herein-described thrust-block for brake-beams, the same having a recess for a brake-hanger and an opening for the passage of securing means for the brake-head; substantially as described.

7. In a trussed brake-beam, the combination of a thrust-block and a removable brake-head, one of said parts having an opening and the other of said parts being provided with a registering opening, and a tapered wedge-key passing through said openings; substantially as described.

813,706. **BRAKE-BEAM.** CHARLES F. HUNTOON, Chicago, Ill., assignor to Chicago Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed July 20, 1905. Serial No. 271,862.



Claim.—1. In a trussed brake-beam, the combination with a thrust-block having a notched flange at its inner end and a perforated beam at its outer end, a brake-head having a projection on its inner end extending into the notch of said flange and having a perforated boss on its outer end registering with the perforated beam of

the thrust-block, and a fastening device passing through said perforated bosses; substantially as described.

3. In a trussed brake-beam, the combination with a thrust-block having a notched flange on its inner end, a brake-head having similar perforated bosses on its inner and outer ends, the boss on the inner end entering the notch in said flange, and means cooperating with the boss on the outer end of said brake-head for holding said brake-head in position; substantially as described.

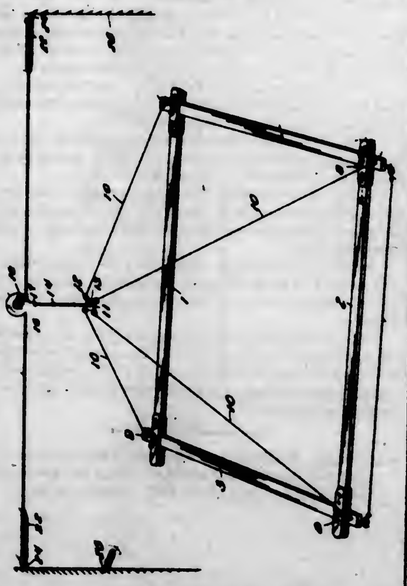
3. In a trussed brake-beam, the combination with a thrust-block having a perforated boss, of a brake-head fitting on said thrust-block and provided with a registering perforated boss, the perforations in said bosses being of substantially the same size, and a fastening device passing through said perforated bosses so as to hold the parts immovably together; substantially as described.

4. The herein-described thrust-block, the same having a circumferentially-notched flange at its inner end and a perforated boss at its outer end; substantially as described.

5. The herein-described thrust-block, the same having a flange at its inner end, said flange having notches or recesses 5^a and 5^b; substantially as described.

6. The herein-described brake-head, the same having a perforated boss on both ends; substantially as described.

813,707. QUILTING-FRAME. HUGH H. JACKSON, Lebanon, Tenn. Filed May 17, 1905. Serial No. 260,817.

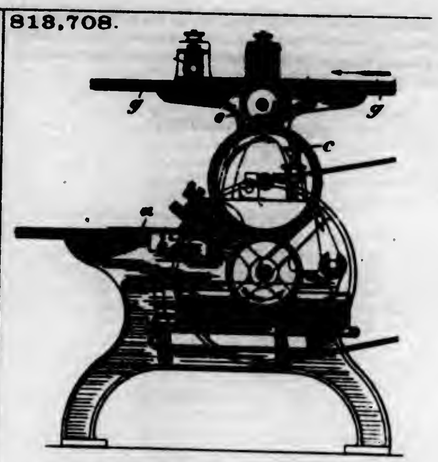


Claim.—In a quilting-frame, side bars, each having pairs of upper and lower clamping-plates secured thereto and extending over opposite ends thereof, end bars removably clamped between the said clamping-plates, a trolley-wire disposed above the frame, a traveling hanger disposed upon the said wire, a plate slidably mounted upon the hanger, a connection between the opposite ends of each end bar and the said plate, means for adjusting the plate vertically upon the hanger, and a flexible connection between the end bars and extending parallel with the corresponding side bar.

813,708. CONTRIVANCE FOR COVERING CARDBOARD, SHEET METAL, WOOD, &c., WITH PAPER, &c. FERDINAND H. JOHNSSON, Pforzheim, Germany. Filed June 20, 1905. Serial No. 265,492.

Claim.—In a cardboard-covering machine, a glue-roller, combined with a feed-roller and a guide-roller placed in proximity to the glue-roller at a distance from the feed-roller, a pressure-roller above the guide-roller, and a divided feed-table at opposite sides of the guide-roller, substantially as specified.

813,708.



813,709. COMPOSITION FOR CLEANING LITHOGRAPHIC STONES. JOSEPH JAMES, Baltimore, Md. Filed Dec. 4, 1905. Serial No. 290,692.

Claim.—1. The herein-described composition of matter, consisting of an acid reacting compound, a solution of strontian nitrate, nitric acid and water substantially as described and for the purpose specified.

2. The herein-described composition of matter for preparing lithographic stones after having been previously used, consisting of a solution of acetic acid, thirteen ounces, a solution of strontian nitrate, seven and a half ounces, nitric acid, about five ounces, and water substantially pure, fifteen ounces, substantially as described.

3. The herein-described composition of matter for preparing lithographic stones after having been previously used, consisting of a solution of an acid reacting compound, thirteen ounces; a solution of strontian nitrate, seven and a half ounces, nitric acid, about five ounces, and water substantially pure fifteen ounces, substantially as described.

813,710. RELAY. HERMINE JOHANSSON, Stockholm, Sweden, assignor to Aktiebolaget L. M. Ericsson & Co., Stockholm, Sweden, a Corporation. Filed July 21, 1904. Serial No. 217,081.

Claim.—1. In a relay, the combination of electromagnetic coils, an insulating-block associated therewith, a contact secured at each end of said block, and an armature adapted to alternately engage the poles of the electromagnetic coils and to press the contacts together, substantially as described.

2. In a relay, the combination of electromagnetic coils, a pivoted armature, a set of contacts, and means near the center of the armature for pressing the contacts together when the armature is attracted, substantially as described.

3. In a relay, the combination of electromagnetic coils, an insulating-block arranged over the coils, a spring-contact secured to each end of said block, the free ends of said contacts overlapping, and an oscillating armature adapted to press said contacts together, substantially as described.

4. In a relay the combination of electromagnetic coils, a pivoted armature having a hook-shaped part at each end thereof and a set of contacts arranged to be pressed together when the armature is attracted, said hook-shaped parts being adapted to alternately engage the pole-pieces of the coils, substantially as described.

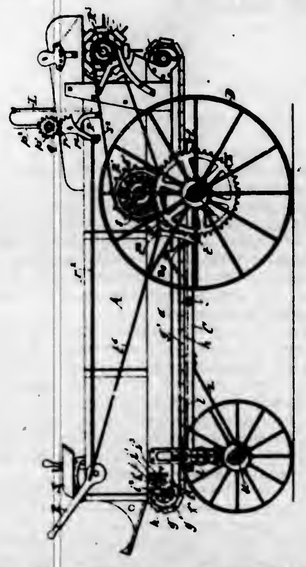
5. In a relay, the combination of electromagnetic coils, a double-armed armature pivoted at its center, a set of contacts, and means near the center of the armature for pressing the contacts together, substantially as described.

6. In a relay, the combination of electromagnetic coils, an armature with hook-shaped ends adapted to alternately partially encircle the pole-pieces of said coils, a set of contacts associated with the armature, means for returning the armature to its normal position and means for preventing the armature from adhering to said pole-pieces upon cessation of the flow of current, substantially as described.

7. In a relay, the combination of electromagnetic coils, an armature pivoted intermediately of the coils, a set of contacts adapted to be pressed together by the armature when the latter is attracted, and means for regulating the tension of the armature, said means comprising a slotted screw mounted in a standard, and a spring extending from said screw to a post on the armature substantially as described.

8. In a relay, the combination of electromagnetic coils, pole-pieces passing therethrough, said pole-pieces being surrounded by copper sockets, a plate mounted on said pole-pieces carrying an insulating-block, contacts on said block, an armature pivoted near its center having an insulated pin for pressing together said contacts, an adjustable screw mounted on said plate, a second plate, a second pin on the armature and a spring extending from said screw to said second pin for returning the armature to its normal position, substantially as described.

813,711. FERTILIZER-DISTRIBUTER. CHARLES JOHNSON, Cortland, N. Y., assignor to Cortland Implement Company, Cortland, N. Y., a Corporation of New York. Filed May 13, 1905. Serial No. 260,956.



Claim.—1. The combination with the vehicle-body provided with a longitudinally-movable apron, a ratchet-wheel transmitting motion to said apron, and pawls engaging the ratchet-wheel at diametrically opposite points, of a rotary cam-plate having its cams projecting equidistant from the axis of the plate and disposed uniform distances apart, a link suspended from the body and swung by contact with the cams, a rock-arm pivoted at one end to the body, a bar pivotally connecting the opposite end of the rock-arm to the link, a collar mounted on the rock-arm movably lengthwise thereof, rods connected to said collar and transmitting motion to the pawls, and means for shifting the collar on the rock-arm as set forth.

2. The combination with the vehicle-body provided with a longitudinally-movable apron, a ratchet-wheel transmitting motion to said apron, and pawls engaging the ratchet-wheel at diametrically opposite points, of a rotary cam-plate having its cams projecting equidistant from the axis of the plate and disposed uniform distances apart, a link suspended from the body and swung by contact with the cams, a rock-arm actuated by said link, a collar mounted on the rock-arm movably lengthwise thereof, rods connected to said collar and transmitting motion to the pawls, a two-armed lever pivoted at one end to the body and at the opposite end to the movable collar, a rod connected to the central portion of the two-armed lever and extended to the front end of the body, and a hand-lever connected to the front end of said rod as set forth.

3. The combination with the vehicle-body provided with a longitudinally-movable apron, a ratchet-wheel transmitting motion to said apron and pawls engaging the ratchet-wheel at diametrically opposite points, of a rotary cam-plate having its cams projecting equidistant from the axis of the plate and disposed uniform distances apart, a link suspended from the vehicle-body and swung by contact with the cams, a rock-arm pivoted at one end to the body, a bar connecting the opposite end of the rock-arm to the link adjustably to different distances from the pivot of the link, a collar mounted on the rock-arm adjustably lengthwise thereof, rods connecting said collar to the aforesaid pawls, and means for shifting the collar on the rock-arm as and for the purpose set forth.

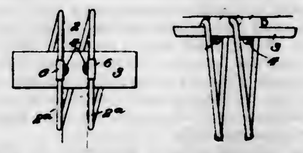
4. The combination with the running-gears, the reach and the traveling apron, of rollers pivoted to the reach and supporting the lower run of the apron as set forth and shown.

5. In a fertilizer-distributing machine, the vehicle formed with a bottom frame consisting of side bars mounted on the front and rear running-gears, cross-bars tying together the said side bars at the ends and center of the frame, intermediate longitudinal bars fastened to the cross-bars, longitudinal tie-rods fastened at their ends to the end cross-bars in proximity to the intermediate longitudinal bars and passing through the end portions of the central cross-bar, and transverse truss-rods tied at their ends to the side bars and passing across the bottoms of the intermediate longitudinal bars, in combination with transverse shafts supported on the ends of the aforesaid side bars and provided with sprocket-wheel engaging chains attached to the endless apron traveling over the said frame and supported thereon as set forth.

6. The combination with the running-gear, the body, and the endless apron traveling through said body, of the reach disposed beneath the lower run of said apron, and rollers pivoted to said reach and supporting said portion of the apron as set forth.

7. The combination with the vehicle-body, the traveling apron and the beater, of a gear-wheel driven by the traction-wheel, a pinion supported movably to and from engagement with the said gear-wheel, means for shifting said pinion, means for transmitting motion from the pinion to the beater, a transverse shaft mounted on the vehicle-body, standards fixed to said shaft and having their upper ends extended rearward, the tail-board suspended from said rearward extension, a pinion fastened to the transverse shaft, a segmental gear engaging the said pinion, a lever affixed to said segmental gear, a hand-lever, and two rods connecting said hand-lever respectively with the aforesaid pinion-shifting means and the lever of the segmental gear as set forth and shown.

813,712. BROOM-HOLDER. WILLIAM M. KELLOGG, Pittsfield, Mass., assignor to The Yankee Novelty Company, a Corporation of Maine. Filed June 12, 1905. Serial No. 264,821.



Claim.—1. In a broom-holder, the combination of a holding member composed of a length of wire bent to form spaced spring-loops, and an attaching-block engaging the central portion of the wire to secure the holding member in operative position, the extremities of the wire from which the loops are made, being freely movable toward and from each other, for the purpose specified.

2. In a broom-holder, the combination of a holding member composed of spaced expansive coils or loops formed from a single length of material, and means for attaching said holding member to a support, admitting of expansive movement of the ends of the material from which the loops are made.

3. In a broom-holder, the combination of a holding member composed of spaced spring-loops made from a single length of spring-wire, and an attaching-block for the holding member provided with spaced lugs receiving a portion of the holding member therebetween, the extremities of the spring-wire from which the holding member is made, being arranged at the outer sides of the spaced lugs and movable toward and from said lugs.

2584 OFFICIAL GAZETTE. FEBRUARY 27, 1906.
FEBRUARY 27, 1906. U. S. PATENT OFFICE. 2585

the thrust-block, and a fastening device passing through said perforated bosses; substantially as described.

2. In a trussed brake-beam, the combination with a thrust-block having a notched flange on its inner end, a brake-head having similar perforated bosses on its inner and outer ends, the boss on the inner end entering the notch in said flange, and means cooperating with the boss on the outer end of said brake-head for holding said brake-head in position; substantially as described.

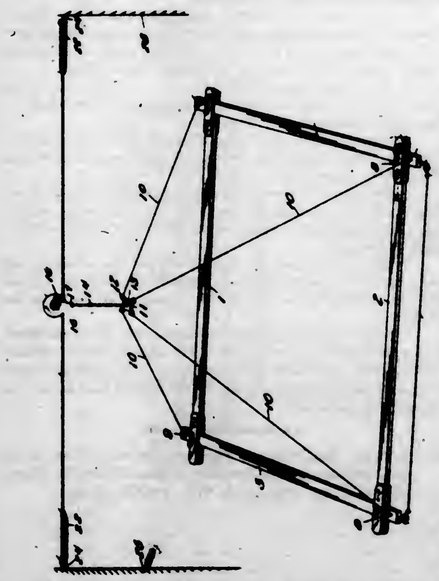
3. In a trussed brake-beam, the combination with a thrust-block having a perforated boss, of a brake-head fitting on said thrust-block and provided with a registering perforated boss, the perforations in said bosses being of substantially the same size, and a fastening device passing through said perforated bosses so as to hold the parts immovably together; substantially as described.

4. The herein-described thrust-block, the same having a circumferentially-notched flange at its inner end and a perforated boss at its outer end; substantially as described.

5. The herein-described thrust-block, the same having a flange at its inner end, said flange having notches or recesses 5^a and 5^b; substantially as described.

6. The herein-described brake-head, the same having a perforated boss on both ends; substantially as described.

818,707. QUILTING-FRAME. HUGH H. JACKSON, Lebanon, Tenn. Filed May 17, 1905. Serial No. 260,817.

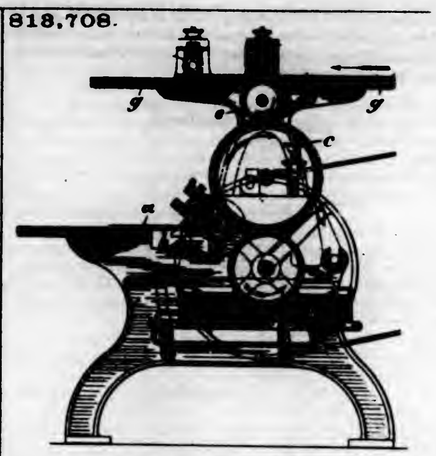


Claim.—In a quilting-frame, side bars, each having pairs of upper and lower clamping-plates secured thereto and extending over opposite ends thereof, end bars removably clamped between the said clamping-plates, a trolley-wire disposed above the frame, a traveling hanger disposed upon the said wire, a plate slidably mounted upon the hanger, a connection between the opposite ends of each end bar and the said plate, means for adjusting the plate vertically upon the hanger, and a flexible connection between the end bars and extending parallel with the corresponding side bar.

818,708. CONTRIVANCE FOR COVERING CARDBOARD, SHEET METAL, WOOD, &c., WITH PAPER, &c. FERDINAND B. JANSSENS, Düsseldorf, Germany. Filed June 20, 1905. Serial No. 265,626.

Claim.—In a cardboard-covering machine, a glue-roller, combined with a feed-roller and a guide-roller placed in proximity to the glue-roller at a distance from the feed-roller, a pressure-roller above the guide-roller, and a divided feed-table at opposite sides of the guide-roller, substantially as specified.

818,708.



818,709. COMPOSITION FOR CLEANING LITHOGRAPHIC STONES. JOSEPH JAMES, Baltimore, Md. Filed Dec. 4, 1905. Serial No. 290,662.

Claim.—1. The herein-described composition of matter, consisting of an acid reacting compound, a solution of strontian nitrate, nitric acid and water substantially as described and for the purpose specified.

2. The herein-described composition of matter for preparing lithographic stones after having been previously used, consisting of a solution of acetic acid, thirteen ounces, a solution of strontian nitrate, seven and a half ounces, nitric acid, about five ounces, and water substantially pure, fifteen ounces, substantially as described.

3. The herein-described composition of matter for preparing lithographic stones after having been previously used, consisting of a solution of an acid reacting compound, thirteen ounces; a solution of strontian nitrate, seven and a half ounces, nitric acid, about five ounces, and water substantially pure fifteen ounces, substantially as described.

818,710. RELAY. HERMANN JOHANNSEN, Stockholm, Sweden, assignor to Aktiebolaget L. M. Ericsson & Co., Stockholm, Sweden, a Corporation. Filed July 21, 1904. Serial No. 217,261.

Claim.—1. In a relay, the combination of electromagnetic coils, an insulating-block associated therewith, a contact secured at each end of said block, and an armature adapted to alternately engage the poles of the electromagnetic coils and to press the contacts together, substantially as described.

2. In a relay, the combination of electromagnetic coils, a pivoted armature, a set of contacts, and means near the center of the armature for pressing the contacts together when the armature is attracted, substantially as described.

3. In a relay, the combination of electromagnetic coils, an insulating-block arranged over the coils, a spring-contact secured to each end of said block, the free ends of said contacts overlapping, and an oscillating armature adapted to press said contacts together, substantially as described.

4. In a relay the combination of electromagnetic coils, a pivoted armature having a hook-shaped part at each end thereof and a set of contacts arranged to be pressed together when the armature is attracted, said hook-shaped parts bing adapted to alternately engage the pole-pieces of the coils, substantially as described.

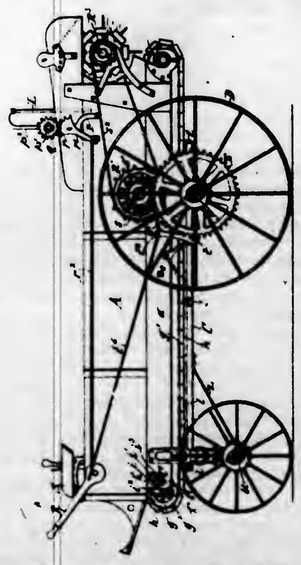
5. In a relay, the combination of electromagnetic coils, a double-armed armature pivoted at its center, a set of contacts, and means near the center of the armature for pressing the contacts together, substantially as described.

6. In a relay, the combination of electromagnetic coils, an armature with hook-shaped ends adapted to alternately partially encircle the pole-pieces of said coils, a set of contacts associated with the armature, means for returning the armature to its normal position and means for preventing the armature from adhering to said pole-pieces upon cessation of the flow of current, substantially as described.

7. In a relay, the combination of electromagnetic coils, an armature pivoted intermediately of the coils, a set of contacts adapted to be pressed together by the armature when the latter is attracted, and means for regulating the tension of the armature, said means comprising a slotted screw mounted in a standard, and a spring extending from said screw to a post on the armature substantially as described.

8. In a relay, the combination of electromagnetic coils, pole-pieces passing therethrough, said pole-pieces being surrounded by copper sockets, a plate mounted on said pole-pieces carrying an insulating-block, contacts on said block, an armature pivoted near its center having an insulated pin for pressing together said contacts, an adjustable screw mounted on said plate, a second plate, a second pin on the armature and a spring extending from said screw to said second pin for returning the armature to its normal position, substantially as described.

818,711. FERTILIZER-DISTRIBUTER. CHARLES JOHNSON, Cortland, N. Y., assignor to Cortland Implement Company, Cortland, N. Y., a Corporation of New York. Filed May 13, 1905. Serial No. 260,956.



Claim.—1. The combination with the vehicle-body provided with a longitudinally-movable apron, a ratchet-wheel transmitting motion to said apron, and pawls engaging the ratchet-wheel at diametrically opposite points, of a rotary cam-plate having its cams projecting equidistant from the axis of the plate and disposed uniform distances apart, a link suspended from the body and swung by contact with the cams, a rock-arm pivoted at one end to the body, a bar pivotally connecting the opposite end of the rock-arm to the link, a collar mounted on the rock-arm movably lengthwise thereof, rods connected to said collar and transmitting motion to the pawls, and means for shifting the collar on the rock-arm as set forth.

2. The combination with the vehicle-body provided with a longitudinally-movable apron, a ratchet-wheel transmitting motion to said apron, and pawls engaging the ratchet-wheel at diametrically opposite points, of a rotary cam-plate having its cams projecting equidistant from the axis of the plate and disposed uniform distances apart, a link suspended from the body and swung by contact with the cams, a rock-arm actuated by said link, a collar mounted on the rock-arm movably lengthwise thereof, rods connected to said collar and transmitting motion to the pawls, a two-armed lever pivoted at one end to the body and at the opposite end to the movable collar, a rod connected to the central portion of the two-armed lever and extended to the front end of the body, and a hand-lever connected to the front end of said rod as set forth.

3. The combination with the vehicle-body provided with a longitudinally-movable apron, a ratchet-wheel transmitting motion to said apron and pawls engaging the ratchet-wheel at diametrically opposite points, of a rotary cam-plate having its cams projecting equidistant from the axis of the plate and disposed uniform distances apart, a link suspended from the vehicle-body and swung by contact with the cams, a rock-arm pivoted at one end to the body, a bar connecting the opposite end of the rock-arm to the link adjustably to different distances from the pivot of the link, a collar mounted on the rock-arm adjustably lengthwise thereof, rods connecting said collar to the aforesaid pawls, and means for shifting the collar on the rock-arm as and for the purpose set forth.

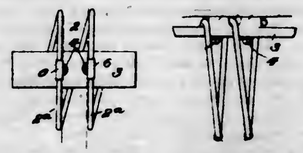
4. The combination with the running-gears, the reach and the traveling apron, of rollers pivoted to the reach and supporting the lower run of the apron as set forth and shown.

5. In a fertilizer-distributing machine, the vehicle formed with a bottom frame consisting of side bars mounted on the front and rear running-gears, cross-bars tying together the said side bars at the ends and center of the frame, intermediate longitudinal bars fastened to the cross-bars, longitudinal tie-rods fastened at their ends to the end cross-bars in proximity to the intermediate longitudinal bars and passing through the end portions of the central cross-bar, and transverse truss-rods tied at their ends to the side bars and passing across the bottoms of the intermediate longitudinal bars, in combination with transverse shafts supported on the ends of the aforesaid side bars and provided with sprocket-wheel engaging chains attached to the endless apron traveling over the said frame and supported thereon as set forth.

6. The combination with the running-gear, the body, and the endless apron traveling through said body, of the reach disposed beneath the lower run of said apron, and rollers pivoted to said reach and supporting said portion of the apron as set forth.

7. The combination with the vehicle-body, the traveling apron and the beater, of a gear-wheel driven by the traction-wheel, a pinion supported movably to and from engagement with the said gear-wheel, means for shifting said pinion, means for transmitting motion from the pinion to the beater, a transverse shaft mounted on the vehicle-body, standards fixed to said shaft and having their upper ends extended rearward, the tail-board suspended from said rearward extension, a pinion fastened to the transverse shaft, a segmental gear engaging the said pinion, a lever affixed to said segmental gear, a hand-lever, and two rods connecting said hand-lever respectively with the aforesaid pinion-shifting means and the lever of the segmental gear as set forth and shown.

818,712. BROOM-HOLDER. WILLIAM M. KELLOGG, Pittsfield, Mass., assignor to The Yankee Novelty Company, a Corporation of Maine. Filed June 12, 1905. Serial No. 264,921.

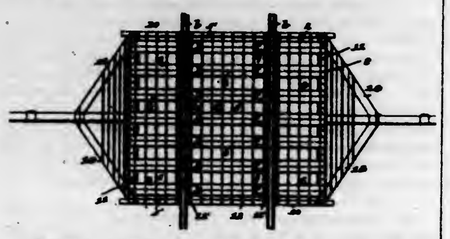


Claim.—1. In a broom-holder, the combination of a holding member composed of a length of wire bent to form spaced spring-loops, and an attaching-block engaging the central portion of the wire to secure the holding member in operative position, the extremities of the wire from which the loops are made, being freely movable toward and from each other, for the purpose specified.

2. In a broom-holder, the combination of a holding member composed of spaced expansive coils or loops formed from a single length of material, and means for attaching said holding member to a support, admitting of expansive movement of the ends of the material from which the loops are made.

3. In a broom-holder, the combination of a holding member composed of spaced spring-loops made from a single length of spring-wire, and an attaching-block for the holding member provided with spaced lugs receiving a portion of the holding member therebetween, the extremities of the spring-wire from which the holding member is made, being arranged at the outer sides of the spaced lugs and movable toward and from said lugs.

813,713. CATTLE OR STOCK GUARD. WILLIAM H. KNIGHT, Portland, Oreg. Filed June 7, 1905. Serial No. 264,867.



Claim.—1. A cattle or stock guard comprising a base, and a series of cross-ties extending up from said base for supporting the rails and for forming a series of pits within said guard, said pits being deeper than those formed by the ordinary cross-ties and substantially wide enough to allow the largest hoof to be inserted therein.

2. A cattle or stock guard comprising a base, and a series of cross-ties extending up from said base for supporting the rails and for forming a series of pits within said guard, said pits being deeper than those formed by the ordinary cross-ties and substantially wide enough to allow the largest hoof to be inserted therein, and means within said pits for spacing and holding said ties in position.

3. A cattle or stock guard comprising a base, a series of cross-ties extending up from said base for supporting the rails and for forming a series of pits within said guard, said pits being deeper than those formed by the ordinary cross-ties and substantially wide enough to allow the largest hoof to be inserted therein, means within said pits for spacing and holding said ties in position, and a series of barbed wires extending across the spaces between the said ties.

4. A cattle or stock guard comprising a base, a series of cross-ties extending up from said base for supporting the rails and for forming a series of pits within said guard, said pits being deeper than those formed by the ordinary cross-ties and substantially wide enough to allow the largest hoof to be inserted therein, said ties being provided with triangular upper faces thereon, means within said pits for spacing and holding said ties in position, and a series of barbed wires extending across the spaces between the ties and under the said triangular faces thereon.

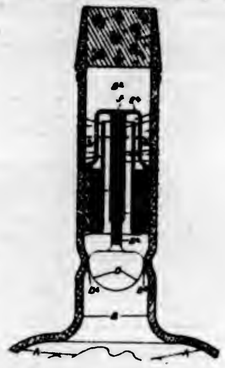
813,714. BOLT-LOCKING WASHER. HENRY W. KITCHAM, Patchogue, N. Y. Filed Oct. 30, 1905. Serial No. 285,019.

Claim.—1. A bolt-lock comprising a screw-bolt, its nut, a fixed bar to be bolted, and a resilient washer of square form, arranged between the bolt-head and the fixed plate and having on each side a pair of sharp or biting ridges, these on one side at right angles to those on the other side, each radial from a corner, each of V shape in cross-section and each having a greater projection at their outer ends than at their inner ends from the surface, the ridges on one side biting into the bolt-head and the ridges on the other side biting into said fixed bar for locking thereby the bolt and its nut.

2. As an improved article of manufacture the bolt-locking washer herein described consisting of a square resilient plate having smooth parallel sides, one side having sharp ridges radial at two corners, the other side having sharp ridges radial at the other two corners, each ridge of V shape in cross-section and having greater projection from the surface at their outer than at their inner ends.

813,715. NON-REFILLABLE BOTTLE. JOHN M. KILDUFF, Boston, Mass. Filed Aug. 8, 1905. Serial No. 273,494.

Claim.—A bottle, or such like, having a valve-seat in its neck, a valve to seat on said seat and having an upward-projecting guiding-stem, a cage secured within and to the neck above said valve and its seat and having upper and lower closed ends and an open space around, and also having lateral or side ports in its upper end portion, and a vertical tube within the cage, open at its upper and lower ends and held by the lower end portion and its upper end portion opposite to said ports of the cage, and having an open space about and between it and the inner side of said upper end portion of the cage, in combination with a spiral or coiled spring adapted and arranged to act on said valve, and a tube surrounding and confining said spring, substantially as described, and for the several purposes specified.



813,716. WINDOW. WILLIAM J. KLEHM, Chicago, Ill. Filed Oct. 10, 1904. Serial No. 227,827.

Claim.—1. The combination with a window-casing and inclosed sash, of rigid supporting-bars sliding vertically of the casing and between and to which the sash is pivotally hung, the pivots being rigidly attached to the supporting-bar, weather-bars interposed between said supporting-bars and the sash, counterbalancing-cords for sustaining the weight of the sash, and connections between said counterbalancing-cords and supporting-bars acting by the normal pull on the cords upon the weather-bars to press them against the sash, substantially as described.

2. The combination with a window-casing and inclosed sash, of supporting-bars sliding vertically of the casing, pivot-bolts rigidly secured to said supporting-bars and upon which the sash is pivotally hung, weather-bars interposed between the supporting-bars and sash and through which the pivot-bolts loosely pass, counterbalancing-cords for sustaining the weight of the sash, and connections between said counterbalancing-cords and supporting-bars acting by the normal pull on the cords upon the weather-bars to press them against the sash, substantially as described.

3. The combination with a window-casing and inclosed sash, of supporting-bars sliding vertically in the casing and between which the sash is pivotally hung, weather-bars interposed between said supporting-bars and the sash, counterbalancing-cords for sustaining the weight of the sash, and connections between said counterbalancing-cords and supporting-bars comprising jointed struts interposed between the counterbalancing-cords and supporting-bars and acting upon the weather-bars to press them against the sash, substantially as described.

4. The combination with a window-casing and inclosed sash, of supporting-bars sliding vertically of the casing and between which the sash is pivotally hung, weather-bars interposed between said supporting-bars and the sash, jointed struts interposed between the supporting and weather bars and engaging the supporting-bar at its upper end, and counterbalancing-cords applied to the lower end of the strut to simultaneously support the weight of the sash and force the weather-bars against the sash, substantially as described.

5. The combination with a window-casing and inclosed sash, of supporting-bars sliding vertically in grooves in the casing, weather-bars sliding vertically in the grooves in the casing and normally projecting into grooves in the sash, pivot-bolts mounted in the supporting-bars and projecting loosely through the weather-bars to pivotally support the sash, counterbalancing-cords or the like for sustaining the weight of the sash, and connections between said counterbalancing-cords and supporting-bars acting upon the weather-bars to press them against the sash, substantially as described.

6. The combination with a window-casing and inclosed sash, of

supporting-bars sliding vertically in grooves in the casing, weather-bars sliding vertically in the grooves in the casing and normally projecting into grooves in the sash, pivot-bolts mounted in the supporting-bars and projecting loosely through the weather-bars to pivotally support the sash, counterbalancing-cords or the like for sustaining the weight of the sash, and connections between said counterbalancing-cords and supporting-bars comprising jointed struts interposed between counterbalancing-cords and supporting-bars and acting upon the weather-bars to press them against the sash, substantially as described.

7. The combination with a window-casing and inclosed sash, of supporting-bars sliding vertically in grooves in the casing, weather-bars sliding vertically in the grooves in the casing and normally projecting into grooves in the sash, pivot-bolts mounted in the supporting-bars and projecting loosely through the weather-bars to pivotally support the sash, counterbalancing-cords or the like for sustaining the weight of the sash, jointed struts interposed between the supporting and weather bars and engaging the supporting-bar at its upper end, and counterbalancing-cords applied to the lower end of the strut to simultaneously support the weight of the sash and force the weather-bars against the sash, substantially as described.

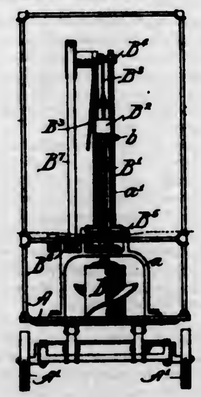
8. The combination with a window-casing and inclosed sash, of supporting-bars sliding vertically in grooves in the casing, weather-bars sliding vertically in the grooves in the casing and normally projecting into grooves in the sash, pivot-bolts mounted in the supporting-bars and projecting loosely through weather-bars to pivotally support the sash, counterbalancing-cords or the like for sustaining the weight of the sash, jointed struts interposed between the supporting and weather bars and consisting of middle sections bearing against the supporting-bars and end sections of which the upper sections engage the supporting-bars while the lower sections engage counterbalancing-cords which simultaneously support the weight of the sash and force the middle section of the strut against the weather-bars and toward the sash, substantially as described.

9. In combination, a casing, supporting-bars slidable therein and each carrying a pivot, a sash swung on these pivots, sash-engaging bars, a yielding pressure device between each supporting-bar and each sash-engaging bar, this pressure device embodying a vertical flat bar bearing yieldingly against the sash-engaging bar and provided with a bolt through which the pivot passes.

10. In combination, a window-casing grooved vertically, supporting-bars slidable vertically in said grooves, a sash swung to and between said supporting-bars, sash-engaging bars, yielding devices inclosed between each sash-engaging bar and supporting-bar and supported on the latter, weight-cords, and connections between the weight-cords and said yielding devices whereby the normal pull on the cords will expand said devices and press the sash-engaging bars against the sash.

11. In combination, a casing, supporting-bars slidable therein and each carrying a pivot, a sash swung on these pivots, sash-engaging bars, a yielding pressure device between each supporting-bar and each sash-engaging bar, this pressure device embodying a vertical flat bar bearing yieldingly against the sash-engaging bar, for the purpose set forth.

813,717. PLANT-EXCAVATOR. RUDOLPH D. KLEIS, Streator, Ill. Filed Sept. 21, 1905. Serial No. 279,608.



Claims.—1. In a machine of the character set forth, the combination of a vehicle, an engine thereon, a standard, an auger having a vertically-movable shaft journaled in said standard, a transverse shaft geared to said auger-shaft, an extension of said standard, a transverse shaft journaled in the upper portion thereof; transmission means between the engine and transverse shafts, a bearing for the upper end of the auger-shaft, and a cable supporting said bearing and the auger depending therefrom and passing about said second-named transverse shaft, said cable having a free end adapted to be grasped by the operator, thereby to cause the upper transverse shaft to elevate the auger.

2. The combination of a platform equipped with wheels and guiding means, an engine supported at the rear end of the platform, a standard supported on the front end of the platform, a vertically-movable auger having a shaft journaled in said standard, a transverse shaft geared to the auger-shaft and connected with the engine, a higher transverse shaft connected with the first-named transverse shaft, and auger-elevating means connecting the auger-shaft and the second-named transverse shaft.

3. The combination of a platform equipped with wheels and guiding means, an engine supported at the rear end of the platform, a standard supported on the front end of the platform, a vertically-movable auger having a shaft journaled in said standard, a transverse shaft geared to the auger-shaft and connected with the engine, a standard extension provided with a guide, a bearing supporting the auger-shaft and movable in said guide, a second transverse shaft journaled in the upper end of the standard extension and belted to the first-named transverse shaft, and a cable supporting said bearing and having a free end passed about the upper transverse shaft, for the purpose set forth.

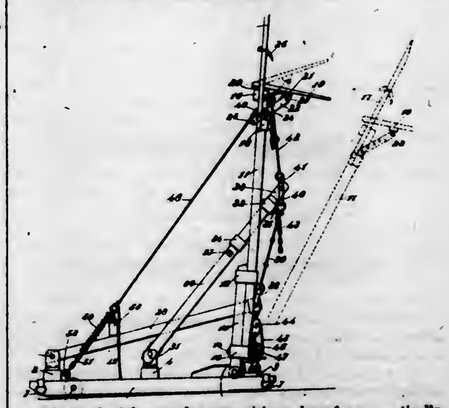
813,718. TROLLING-SPOON. SAMUEL H. KNOWLES, San Francisco, Cal. Filed Aug. 26, 1904. Serial No. 223,344.

Claim.—1. A trolling-spoon, a fish-hook, a line connected therewith, and fastening means on the spoon for detachably fixing the hook to the spoon in a rigid position.

2. A trolling-spoon having fastening devices on its face adapted to fix a fish-hook to the spoon in a rigid position and provided with means for attaching a line, in combination with a fish-hook having a shank fitted to the fastening devices on the spoon and detachable therefrom under a strain, and means for connecting the hook with the spoon whereby the hook remains connected with the line after it becomes detached from the fastening devices.

3. The combination of a trolling-spoon, a hook, means for detachably fixing the hook on the spoon, means connecting the hook and the spoon permanently together, and means for attaching the spoon to a line.

813,719. HAY-STACKER. CASPER KOEHLER, Canyon City, Oreg. Filed Sept. 21, 1905. Serial No. 279,512.



Claim.—1. A hay-stacker comprising a base-frame, vertically-swinging stacker-arms pivotally supported upon the frame, a stacker-

head carried by the free ends of the arms, a mast pivotally rising from the frame, a prop hinged to the frame and straddling the mast, a con-

4. A press having side troughs and a central trough, a mold adapted to be moved upon the troughs and means for elevating the mold

6. A frame having side pieces connected near their front and rear ends by screw-threaded rods, nuts supported adjustably upon

supplying packing liquid to the bottom of said chamber, an escape pipe or passage connected to the top of the chamber and an auto-

hand carried by the free ends of the arms, a mast pivotally rising from the frame, a prop hinged to the frame and straddling the mast, a connection between the free end of the prop and the stacker-arms, a connection between the free ends of the mast and the prop, and a block and tackle connected to the mast and the rear portion of the frame for swinging the mast and elevating the stacker-arms

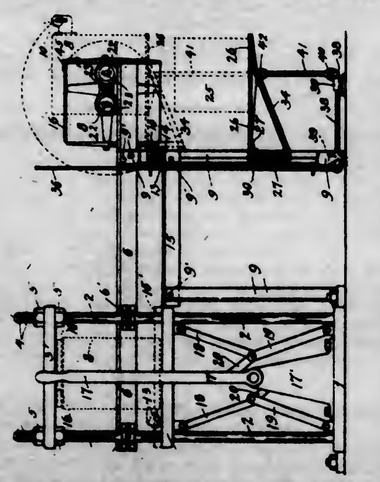
2. In a hay-stacker, the combination with a base-frame, of longitudinally-extensible stacker-arms pivotally supported upon the base-frame, a stacker-head carried by the free ends of the arms, a mast pivotally supported upon the frame, a prop hinged to the base-frame and comprising spaced members embracing the mast, an extensible prop member shiftable endwise between the outer end portions of the hinged prop members, a connection between the extensible prop member and the stacker-arms, another connection between the top of the mast and the extensible prop member, and a block and tackle extending between the top of the mast and the base-frame.

3. In a hay-stacker, the combination of a base-frame made up of spaced sills, and front, intermediate and rear cross-bars connecting the same, of a rock-bar mounted upon the rear portion of the frame and projected at opposite sides thereof, stacker-arms carried by the projected ends of the rock-bar and extending in front of the base-frame, a stacker-head carried by the free ends of the stacker-arms, a mast pivotally rising from the front cross-bar, a prop pivotally supported upon the intermediate cross-bar and straddling the mast, a connection between the free ends of the stacker-arms and the free end of the prop, a connection between the free ends of the mast and the prop, and a block and tackle extending between the free end of the mast and the rear cross-bar of the base-frame.

813,720. DECORATIVE PROCESS. ADOLPH KUHLBROW, Two Rivers, Wis., assignor to Aluminum Manufacturing Company, Two Rivers, Wis. Filed Sept. 11, 1905. Serial No. 278,094.

Claim.—A process of decoration that consists in the application of paint enamel to an opaque surface, smoking the enamel, while moist, with the flame of a candle, lamp, torch or other suitable burner and finally drying the smoked enamel.

813,721. CONCRETE-BLOCK MOLD AND BLOCK. CHARLES K. LARNER, Los Angeles, Cal. Filed May 26, 1905. Serial No. 262,498.



Claim.—1. A press for molding plastic material provided with side rails or tracks and a central rail or track, a mold adapted to travel upon the tracks to and from the press.

2. A press, having side rails, and a central or supplemental rail and supports for the rails, a reversible mold adapted to travel at an angle to and upon the said rails to and from the press.

3. A press provided with side and central tracks and a movable mold adapted to travel to and within the press.

4. A press having side tracks and a central track, a mold adapted to be moved upon the tracks and means for elevating the mold within the press.

5. A press provided with side and central tracks and a traveling mold adapted to be moved to and from the press at an angle to the rails.

6. A press provided with side and central tracks, a reversible mold adapted to travel upon the tracks and means for raising and lowering the mold.

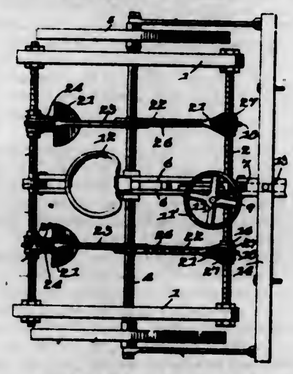
7. A press provided with side tracks and a central track, a mold having wheels secured thereto and means for lowering the molds and for conveying the mold from the press.

8. A press provided with side and central tracks, a mold adapted to be moved to and from the press, means for raising and lowering the mold, a receiving-table and means for raising and lowering the table.

9. A press having tracks, a traveling reversible mold, means for raising and lowering the mold, a movable table for receiving the compressed finished block and means for raising and lowering the table.

10. A press provided with side and central tracks, a traveling reversible mold, means for raising and lowering the mold, a table and means for raising and lowering the table.

813,722. PLOW AND CULTIVATOR. SAM B. LASHLEY, Mullins, S. C. Filed Nov. 15, 1905. Serial No. 287,907.



Claim.—1. A frame including side pieces connected near the front and rear ends by screw-threaded rods, a wheel-carrying axle supporting said side pieces, nuts upon the rods having annular flanges provided with spur-teeth, pawl-carrying levers fulcrumed upon said nuts, plow-carrying standards having eyes engaging the nuts upon the rear screw-threaded rod, and braces connecting said standards with the nuts upon the front screw-threaded rod.

2. A frame including side members and screw-threaded rods connecting said side members near their front and rear ends, nuts adjustable upon said rods, and blade-carrying implements connected operatively with said nuts.

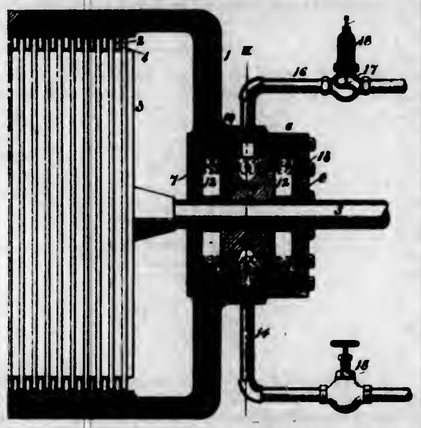
3. A frame including side pieces and screw-threaded rods connecting said side pieces near their front and rear ends, nuts upon said rods having annular flanges, standards having eyes engaging the nuts upon the rear screw-threaded rod at opposite sides of the flanges of said nuts, and braces connected with said standards and having eyes engaging the nuts upon the front screw-threaded rod at opposite sides of the flanges of said nuts.

4. A frame having side pieces connected near their front and rear ends by screw-threaded rods, nuts supported adjustably upon said rods, earth-engaging implements carried by the nuts, an axle supporting the side pieces of the frame, bars engaging said axle between the side pieces of the frame, segmentally-slotted plates supported at the front and rear ends of said bars for the passage of the screw-threaded rods, a block supported loosely upon one of said rods, a nut swiveled upon one of the segment-plates, a screw extending through said nut and swiveled in the loosely-supported block, and a tongue connected with the segment-plate.

5. A frame having side pieces connected near their front and rear ends by screw-threaded rods, nuts supported adjustably upon said rods, earth-engaging implements carried by the nuts, an axle supporting the side pieces of the frame, and means for tilting the frame upon the axle and for securing it at various adjustments.

6. A frame having side pieces connected near their front and rear ends by screw-threaded rods, nuts supported adjustably upon said rods, earth-engaging implements carried by the nuts, an axle supporting the side pieces of the frame, a frame-bar engaging the axle between the side pieces, a plate supported by said frame-piece and having a segmental slot for the passage of the front screw-threaded rod, means for tilting the frame and for securing it at various adjustments with relation to the intermediate frame-bar, a tongue connected with the segment-plate, an equalizer pivoted upon the tongue, and links connecting said equalizer with the axle.

813,723. PACKING. HENRY H. LOSEWELL, Pittsburg, and FRANCIS HODGKINSON, Edgewood Park, Pa., assignors to The Westinghouse Machine Company, a Corporation of Pennsylvania. Filed Nov. 21, 1903. Renewed Nov. 23, 1904. Serial No. 234,606.



Claim.—1. The combination with a rotatable shaft having a circumferential projection, of a cylindrical chamber for said projection and a body of packing liquid partially filling said chamber and retained in the outer portion thereof by the rotation of said projection.

2. The combination with a rotatable shaft having a circumferential projection and a bearing-box having a cylindrical chamber of greater diameter than said projection and in which said projection is concentrically located and a body of packing liquid which partially fills said chamber and is retained in the outer portion thereof by the rotation of said projection.

3. The combination with a shaft and a bearing-box therefor having a cylindrical chamber, of a disk having lateral ribs or wings on one or both of its sides and rigidly supported on the shaft within said chamber and a body of packing liquid in said chamber.

4. The combination with a shaft and a disk rigidly supported thereon and provided with lateral ribs or wings, of a chamber in which said disk has clearance-space and a body of liquid in said chamber.

5. The combination with a shaft and a bearing-box having a cylindrical chamber, of a disk of less diameter than said chamber and rigidly mounted upon the shaft within the chamber, said disk having lateral ribs or wings and said chamber having a body of packing liquid.

6. The combination with a shaft having a disk rigidly mounted thereon, of a chamber in which said disk is located, a body of liquid in said chamber, an inlet-pipe and an outlet-pipe for said liquid and a relief-valve in the outlet-pipe.

7. The combination with a shaft having a disk provided with lateral ribs or wings, of a cylindrical chamber in which said disk has clearance-space, means for supplying liquid to said chamber and an escape pipe or passage having an automatic relief-valve.

8. The combination with a shaft having a circumferentially-grooved disk provided with lateral ribs or wings, of a cylindrical chamber in which said disk has clearance-space, means for supplying packing liquid to the bottom of said chamber and an escape pipe or passage having an automatic relief-valve.

9. The combination with a shaft and a circumferentially-grooved and laterally-ribbed disk rigidly mounted thereon, of a cylindrical chamber in which said disk has clearance-space, means for supplying packing liquid to the bottom of said chamber, an escape pipe or passage connected to the top of the chamber and an automatic relief-valve in said pipe or passage.

10. In a fluid-pressure turbine, the combination with the turbine-shaft and a laterally-ribbed disk rigidly mounted thereon, of a bearing-box having a cylindrical chamber in which said disk has clearance-space, means for supplying packing liquid to the bottom of said chamber, a pipe or passage leading from the top of the chamber, an automatic relief-valve in said pipe or passage and means for adjusting the closing pressure exerted upon said valve.

11. The combination with a rotatable shaft having a disk, of a bearing-box having a chamber for said disk and a body of mobile liquid partially filling said chamber and retained in the outer portion of the chamber by the rotation of the disk.

12. The combination with a shaft having a disk rigidly attached thereto, of a bearing-box having a chamber for said disk in which there are both end and peripheral clearance-spaces and a body of freely-flowing liquid which partially fills said chamber and is retained in the outer portion thereof by the rotation of the disk.

13. In a fluid-pressure turbine, the combination with a casing having a bearing-box provided with a cylindrical chamber, of a shaft having a circumferential projection of less length and diameter than said chamber and located therein and a body of liquid partially filling said chamber and retained in the outer portion thereof by the rotation of said projection.

14. In a fluid-pressure turbine, the combination with a casing having a bearing-box provided with a cylindrical chamber, of a drum-shaft having a rigidly-mounted disk located in said chamber and a body of liquid partially filling said chamber and retained in the outer portion thereof by the rotation of the disk.

15. A stuffing-box comprising an annular chamber containing a liquid and a disk, the periphery of which extends into said chamber, one of said parts being adapted to be maintained in rapid revolution, whereby the liquid is caused to rotate in said chamber to form a joint between the disk and the chamber.

16. A stuffing-box comprising an annular chamber containing a liquid and a disk, the periphery of which extends into said chamber, one of said parts being provided with projections and adapted to be maintained in rapid revolution, whereby the liquid is caused to rotate in said chamber to form a joint between the disk and the chamber.

17. A stuffing-box comprising an annular chamber containing a liquid and a disk, the periphery of which extends into said chamber, one of said parts being adapted to be maintained in rapid revolution, whereby the liquid is caused to rotate in said chamber to form a joint between the disk and the chamber and a reservoir of liquid connected with said chamber.

18. The combination of a shaft having a projecting collar, with a closure surrounding said collar and means for causing a liquid to rotate in said closure and form a seal by its centrifugal force, between the shaft and the closure-walls, for the purpose specified.

19. A stuffing-box, comprising a fixed part and a part combined with a rotating fluid rotated by said rotating part intervening and forming a joint between said parts.

20. A shaft-packing comprising a casing provided with an annular chamber for receiving a liquid surrounding said shaft, a collar secured to said shaft and extending within said chamber whereby the liquid is caused to rotate in said chamber.

21. The combination in a liquid stuffing-box of a shaft having a collar and a case having an annular recess adapted to retain a liquid under rotation surrounding said collar, with means for causing the liquid to rotate.

22. In a liquid stuffing-box, the combination of the shaft and its collar, with a case-recess inclosing said collar adapted to contain a liquid under high rotation, and projections on said collar for causing said liquid to rotate.

813,724. CAR-DOOR HANGER. EDWARD F. LUSE, Chicago, Ill., assignor to Edward F. Luse & Company, Inc., Chicago, Ill., a Corporation of Illinois. Filed May 23, 1904. Serial No. 209,403.

Claim.—1. In an apparatus of the class described, the combination of a hanger-bracket provided with horizontally-extending bearing-slots and with friction-brakes, and a hanger-wheel journaled in such slots and contacting with the friction-brake at or near the end of its movement in the slots.

2. In a door-hanger, the combination of a hanger-arm provided with horizontally-extending bearing-slots, a hanger-wheel provided with journals rotatably and reciprocatingly mounted in such bearing-

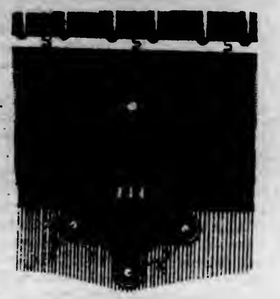
slots, and brake-shoes arranged in the path of movement of such hanger-wheel and having a friction-surface nearer the periphery of such wheel than the distance from the axis of the hanger-wheel to the

through said conduit, a cinder-receiver at the lower end of said conduit and means for collecting gas issuing from said conduit, sub-

said casing through which the gas produced may be withdrawn, substantially as described.

3. The process of testing distilled alcoholic liquor to ascertain the origin of coloring-matter possessed by it, which consists in dis-

slots, and brake-shoes arranged in the path of movement of each hanger-wheel and having a friction-surface nearer the periphery of each wheel than the distance from the end of the bearing-slots to the journals of each wheel, substantially as described.



813,725. COMBINED ENVELOP AND LETTER-PAPER. ABNER B. MAGOUN, Brant Rock, Mass. Filed Sept. 13, 1905. Serial No. 278,262.

Claim.—A combined envelop and sheet of letter-paper consisting of a sheet of paper having a portion thereof cut out to form an opening, the portion of said sheet thus cut out remaining attached, at one side thereof, to said sheet and constituting a flap, said sheet first folded transversely thereacross in alinement with said attached side; second, the two sides of said sheet folded longitudinally of said sheet toward each other, at right angles to said first fold; third, said folded sheet again folded transversely thereof, parallel to said first fold, and finally said flap turned over and secured to the outer face of said sheet.

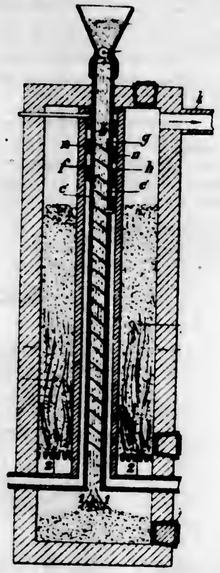
813,726. APPARATUS FOR PRODUCING GAS. GUSTAVE MARCONNET, Paris, France. Filed Dec. 3, 1904. Serial No. 235,669.

Claim.—1. In a gas-producer, a conduit, means for causing jets of flame to project into said conduit, means for causing a shower of powdered fuel to pass through said conduit, means for receiving cinders at the exit end of said conduit and means for collecting gas issuing from said conduit, substantially as described.

2. In a gas-producer, a vertically-arranged conduit, means for causing jets of flame to project into said conduit, means for causing a shower of powdered fuel to fall through said conduit, a cinder-receiver at the lower end of said conduit and means for collecting gas issuing from said conduit, substantially as described.

3. In a gas-producer, a vertically-arranged conduit, gas-openings in said conduit, means for supplying gas and air under pressure to said openings, means for causing a shower of powdered fuel to fall through said conduit, a cinder-receiver at the lower end of said conduit and means for collecting gas issuing from said conduit, substantially as described.

4. In a gas-producer, a vertically-arranged conduit of rectangular shape in cross-section and two of whose walls are pierced with numerous small holes, a gas-chamber with which the holes of one said wall communicate, an air-chamber with which the holes of the opposite wall communicate, means for supplying gas and air respectively to said chambers, means for causing a shower of powdered fuel to fall through said conduit, a cinder-receiver at the lower end of said conduit and means for collecting gas issuing from said conduit, substantially as described.



5. In a gas-producer, a vertically-arranged conduit of rectangular shape in cross-section and two of whose walls are pierced with numerous small holes, a gas-chamber with which the holes of one said wall communicate, an air-chamber with which the holes of the opposite wall communicate, means for supplying gas and air respectively to said chambers, means for heating said air and gas, means for causing a shower of powdered fuel to fall through said conduit, a cinder-receiver at the lower end of said conduit and means for collecting gas issuing from said conduit, substantially as described.

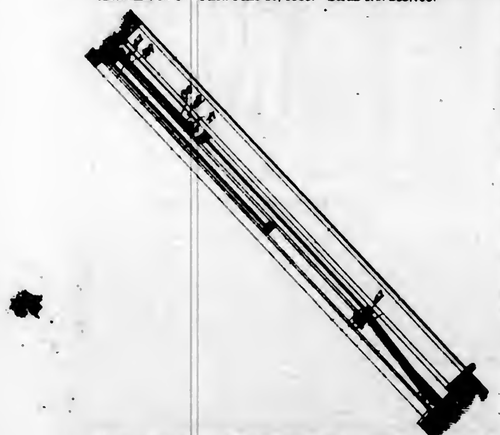
6. In a gas-producer, a vertically-arranged conduit of rectangular shape in cross-section and two of whose walls are pierced with numerous small holes, a gas-chamber with which the holes of one said wall communicate, an air-chamber with which the holes of the opposite wall communicate, means for supplying gas and air respectively to said chambers, means for heating said air and gas, means for delivering water to said conduit, means for causing a shower of powdered fuel to fall through said conduit, a cinder-receiver at the lower end of said conduit and means for collecting gas issuing from said conduit, substantially as described.

7. In a gas-producer, a vertically-arranged conduit of rectangular shape in cross-section and two of whose walls are pierced with numerous small holes, a gas-chamber with which the holes of one said wall communicate, an air-chamber with which the holes of the opposite wall communicate, means for supplying gas and air respectively to said chambers, a heating-chamber in which said conduit and said air and gas chambers are located, a fire-grate in said heating-chamber, means for causing a shower of powdered fuel to fall through said conduit, a cinder-receiver at the lower end of said conduit and means for collecting gas issuing from said conduit, substantially as described.

8. In a gas-producer a vertically-arranged outer casing, a fire-grate in said casing, a conduit centrally arranged within said casing, passing through the top thereof and extending through and slightly below said fire-grate, said conduit having its wall throughout that portion thereof within said casing above said fire-grate pierced with two series of small holes, a chamber communicating with one said series of holes, a second chamber communicating with the other said series of holes, pipes supplying air and gas respectively to said chambers, a hopper for powdered fuel at the upper end of said conduit, a device connected with said hopper adapted to allow the fuel therefrom to fall in a shower into said conduit, a door at the bottom of said casing through which cinders collecting below the open lower end of said conduit can be withdrawn, a pipe at the upper end of said casing through which the gas produced may be withdrawn, substantially as described.

9. In a gas-producer a vertically-arranged outer casing, a fire-grate in said casing, a conduit centrally arranged within said casing, passing through the top thereof and extending through and slightly below said fire-grate, said conduit having its wall throughout that portion thereof within said casing above said fire-grate pierced with two series of small holes, a chamber communicating with one said series of holes, a second chamber communicating with the other said series of holes, pipes supplying air and gas respectively to said chambers, a hopper for powdered fuel at the upper end of said conduit, a device connected with said hopper adapted to allow the fuel therefrom to fall in a shower into said conduit, a door at the bottom of said casing through which cinders collecting below the open lower end of said conduit can be withdrawn, a pipe at the upper end of said casing through which the gas produced may be withdrawn, and water-tubes located in said air and gas chambers adapted to discharge water into said conduit, substantially as described.

813,727. ADJUSTABLE FLY-SCREEN. JOHN A. MARQUARDT, Asheville, N. C. Filed June 17, 1905. Serial No. 265,788.



Claim.—In a device of the class described, a supporting-frame composed of side members having longitudinal rabbets to bear within the runways of one of the sashes and to extend over the parting-stope and with overlapping end members, means for clamping said end members in any required position to adapt the frame to window-openings of various widths, a screen-frame formed of overlapping sections and movably disposed within said supporting-frame and adapted to swing from one edge therein, whereby the free edge of the screen-frame may swing into the path of the other sash and support the same in partly-open position.

813,728. PROCESS FOR ASCERTAINING THE ORIGIN OF COLORING-MATTERS PRESENT IN DISTILLED LIQUORS. CLARENCE T. MASER, Cincinnati, Ohio, assignor of one-half to Louis H. Weinstein, Cincinnati, Ohio. Filed Mar. 30, 1905. Serial No. 253,503.

Claim.—1. The process of testing whisky to ascertain the origin of coloring-matter present in it which consists in distilling fusel-oil with a caustic for depriving the fusel-oil of coloring-matter and thereby forming a cleared amyl alcohol, adding water to said cleared amyl alcohol, mixing the same with the whisky to be tested, whereby the alcohols of said amyl alcohol and of said whisky are associated, then permitting the mixture to rest, whereby water is separated and thrown down under said alcohols by virtue of the higher specific gravity of said water as compared with said alcohols the said water carrying with it and being colored by artificial coloring-matter previously present in said whiskey or remaining clear in the absence of artificial coloring-matter in the said whisky being tested, substantially as described.

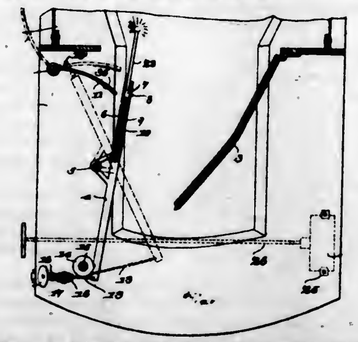
2. The process of testing distilled alcoholic liquor to ascertain the origin of coloring possessed by it, which consists in adding amyl alcohol and water to the distilled liquor, whereby water is separated from the alcohols of said mixture.

3. The process of testing distilled alcoholic liquor to ascertain the origin of coloring-matter possessed by it, which consists in distilling fusel-oil with a caustic for depriving the fusel-oil of coloring-matter and thereby forming a cleared amyl alcohol, adding water to said cleared amyl alcohol and mixing the same with the distilled alcoholic liquor to be tested whereby the amyl alcohol and the ethyl alcohol of said mixture are combined or associated, then permitting the mixture to rest, whereby water is separated and thrown down by virtue of its higher specific gravity as compared with the said alcohols present, with which it is immiscible.

4. The process of testing distilled alcoholic liquor to ascertain the origin of coloring-matter possessed by it which consists in distilling fusel-oil with caustic soda or caustic potash, mixing said distillate with distilled water, and mixing the composition so formed with the distilled alcoholic liquor to be tested whereby intimate union is formed between the alcohol of said distilled fusel-oil and the alcohol of said distilled alcoholic liquor, then permitting the mixture to rest for permitting said water to separate and be thrown under said alcohols, whereby coloring-matter not acquired by the distilled alcoholic liquor during and by the process of aging is separated from said alcohols and thrown down with the water which holds it in solution, all in the manner and in substantially the proportions stated, substantially as described.

5. The process of testing distilled alcoholic liquor to ascertain the origin of coloring possessed by it which consists in adding amyl alcohol and water to the distilled liquor in substantially the proportions stated and agitating said mixture and then permitting the same to rest, whereby the alcohols of said amyl alcohol and said distilled alcoholic liquor are combined and water is separated from said alcohols, the said water being thrown down and carrying with it artificial coloring-matter previously present in said distilled alcoholic liquor, substantially as described.

813,729. FIRE-LIGHTING DEVICE. MILES L. MARTIN, Thomasville, Ga. Filed May 13, 1905. Serial No. 260,204.



Claim.—1. A fire-lighting device having a movable match-carrying member, means for striking a match by the movement of the match-carrying member, and means to discharge a match from the match-carrying member after the match has been ignited.

2. A fire-lighting device having a swinging match-carrying arm, a striker located in the path of the fulminate head of the match carried by the swinging member, and means to eject a match from the swinging member after it has been ignited by the striker.

3. A fire-lighting device comprising a swinging match-carrying arm, means to eject a lighted match from the arm, and a striker arranged in the path of the fulminate head of a match carried by the arm and also constituting means for holding the match upon the arm against the action of the match-ejecting means, said means being active when the match escapes from the striker.

4. A fire-lighting device comprising a swinging match-carrying arm provided in one end with a longitudinal socket and having a spring-pressed match-ejecting plunger working therein, and a striker arranged in the path of the fulminate head of a match carried within the socket, said striker also constituting means to hold a match in the socket of the arm against the pressure of the plunger and the plunger being active to eject the match when the latter escapes from the striker.

5. A fire-lighting device comprising a swinging match-carrying arm, a match-receiving seat at the free end of the arm, a striker in

the path of the fulminate head of a match carried in the seat of the arm, and a tensioned match-ejector for the seat, said striker constituting means to hold a match in the seat against the tension of the

valve in the outer end of the fluid-container, substantially as described.

piston mechanism for closing the doors and automatically moving the piston mechanism to initial position during the operation of clos-

Claim.—1. In a device as described, a main shaft, a gear-disk thereon having a series of concentric sets of gear-teeth, a counter-

the path of the fulminate head of a match carried in the seat of the arm, and a tensioned match-ejector for the seat, said striker constituting means to hold a match in the seat against the tension of the ejector until the swinging arm escapes from the striker.

6. The combination with a support, of a swinging match-carrying arm mounted thereon, a striker carried by the support in coöperative relation with the arm, a guide upon the support, a flexible element engaging the guide with one end connected to the arm and the other end depending from the guide, a weight suspended by the flexible element below the support, a rod carried by the weight and working through the support, a shoulder upon the rod above the support to limit downward movement of the weight, means to support the weight in an elevated position, and means carried by the support to release the weight and permit gravitation thereof.

7. The combination with a support, of a swinging match-carrying arm thereon, a striker in coöperative relation with the arm, a guide upon the support, a flexible element engaging the guide with one end connected to the arm and the other end depending from the guide, a weight carried by the flexible element below the support, a rod rising from the weight and working through the support, a shoulder upon the rod above the support to limit downward movement of the weight, said rod being provided with another shoulder for engagement with the support to hold the weight elevated, a trip-lever fulcrumed upon the under side of the support, and trip mechanism carried by the support for engagement with the lever to swing the latter against the rod and displace the same from the support.

813,780. **STORAGE BATTERY.** ADOLPH MÜLLER, Berlin, Germany. Filed July 30, 1904. Serial No. 218,816.

Claim.—1. A battery plate-support consisting of perforated covers provided with lateral loops, and having pins inserted through the loops, the relation of the loops being such that the pins lock the covers together, substantially as described.

2. A battery plate-support consisting of perforated covers provided respectively at intervals with loops struck up in the same direction, and having pins inserted through the loops and the intervals between the loops, the relation of the loops and intervals being such that the pins lock the covers together, substantially as described.

3. A battery plate-support consisting of perforated covers provided with lateral loops and having pins inserted through them, and U-shaped strips clamping the edges of the covers and the ends of the pins, the relation of the loops being such that the pins lock the covers together, substantially as described.

4. A battery-plate consisting of cakes of active material, or material adapted to become active, a support or envelop consisting of two perforated covers provided with loops, pins engaging the loops and locking the covers together, and U-shaped marginal strips, substantially as described.

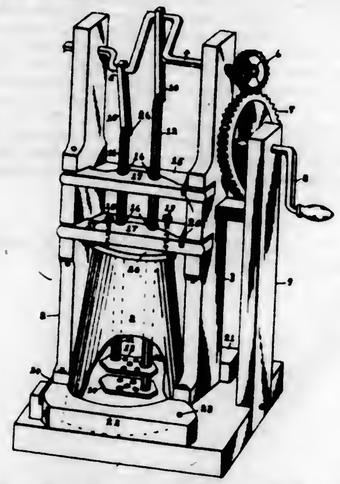
5. A battery-plate consisting of corrugated perforated cover-plates provided with laterally-extending loops, pins engaging the loops and locking the covers together, cakes of active material in the corrugations, and means for clamping the edges of the covers, substantially as described.

813,781. **AERATING DEVICE FOR MATTRESSES.** JOHN MURPHY, Cleveland, Ohio. Filed May 15, 1905. Serial No. 260,593.

Claim.—1. In a device for the purpose described, the combination with a mattress, of a tube adapted to be inserted therein for permanent use, the said tube being perforated throughout its length, a check-valve in the outer end of said tube, and means for supplying said tube with a volatile disinfectant, substantially as described.

2. The combination with a mattress of a fluid or gas container embedded therein, and adapted to contain a sterilizing fluid or gas, the said fluid-container being provided with perforations in its upper wall, means for forcing fluid therein under pressure and a check-valve in the outer end of the fluid-container, substantially as described.

813,782. **CHURNING APPARATUS.** CHRISTOPHER Y. MCCARDLE, Cameron, and SILAS H. DAVIS, Elm Grove, W. Va. Filed May 6, 1904. Serial No. 206,667.



Claim.—In a device of the character described, the combination with a churn-body, of a frame, a shaft with oppositely-disposed cranks thereon mounted in said frame over the churn-body, links connected with said cranks, rods carrying dashers depending from said links within the churn-body, pivots connecting said rods with said links, said pivots being adapted for removal to admit of said churn-body and said rods being together removed from the frame, pivoted braces having semicircular recesses therein embracing said rods and holding them in vertical alinement, the lower of said braces located directly above the churn-body, set-screws extending vertically through the last-mentioned brace for impinging directly upon the churn-lid to hold it in place upon the churn-body, and gearing for driving said shaft, substantially as described.

813,783. **DUMP-CAR.** SPENCER OTIS, Chicago, Ill. Filed Oct. 20, 1904. Serial No. 229,207.

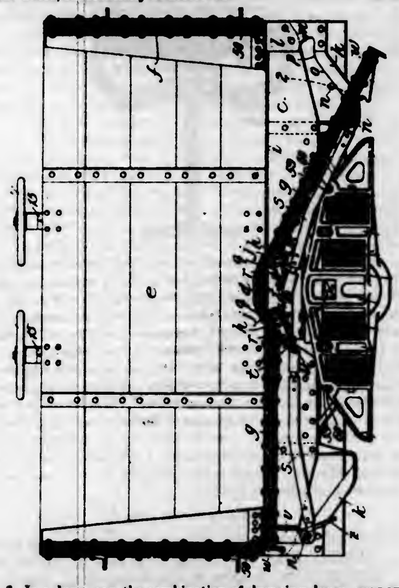
Claim.—1. In a dump-car, the combination of dumping-doors, manually-operated mechanism connected with such doors for operating them, and fluid-pressure cylinder and piston mechanism operatively connected with the doors for releasing them, substantially as described.

2. In a dump-car, the combination of dumping-doors movable to open and closed positions, manually-operated mechanism for closing the doors and supporting them in closed position, and fluid-pressure cylinder and piston mechanism connected with the manually-operated mechanism for operating it in one direction to release the doors, substantially as described.

3. In a dump-car, the combination of dumping-doors movable to open and closed positions, fluid-pressure mechanism for releasing the doors, and means operated independently of the fluid-pressure mechanism for moving the doors from open to closed position, substantially as described.

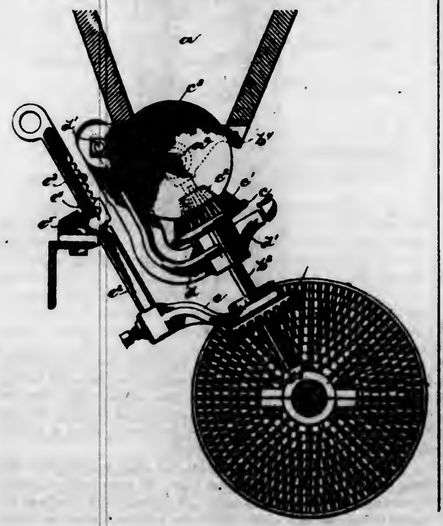
4. In a dump-car, the combination of dumping-doors movable to open and closed positions, fluid-pressure cylinder and piston mechanism for releasing the doors, and mechanism operated independently of the fluid-pressure mechanism for moving the doors to closed position and provided with means for moving the fluid-pressure-piston mechanism to initial position during the operation of closing the doors, substantially as described.

5. In a dump-car, the combination of dumping-doors movable to open and closed positions, means for supporting the doors in closed position, fluid-pressure-cylinder mechanism provided with piston mechanism connected with the doors for releasing them, and manually-operated mechanism connected with the doors and with such piston mechanism for closing the doors and automatically moving the piston mechanism to initial position during the operation of closing the doors, substantially as described.



6. In a dump-car, the combination of dumping-doors, gear and lever mechanism connected with such doors for operating them, fluid-pressure cylinder and piston mechanism operatively connected with such gear and lever mechanism for operating it in one direction to release the doors, and means for moving the gear mechanism in releasing direction while the doors are stationary in closed position to permit the free movement of the doors to open position independently of such gear mechanism, substantially as described.

813,784. **SPEED DEVICE FOR SEEDING-MACHINES.** FRANK R. PACKHAM and GEORGE P. OATES, Springfield, Ohio, assignors to American Seeding Machine Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 23, 1905. Serial No. 283,917.



Claim.—1. In a device as described, a main shaft, a gear-disk thereon having a series of concentric sets of gear-teeth, a counter-shaft, a sliding pinion on said shaft adapted to be moved into engagement with each of the various sets of teeth on said disk, a driven shaft, a gear laterally movable on said shaft, and a stepped pinion on said counter-shaft, the respective steps of which are adapted to be engaged by said laterally-movable gear, substantially as specified.

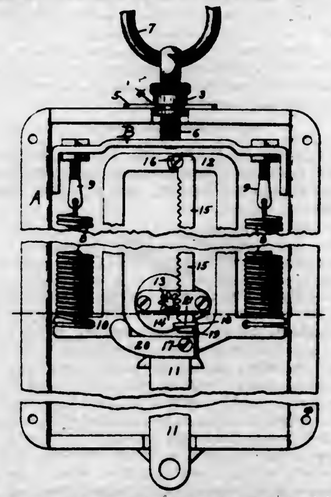
2. In a device as described, a main shaft, a gear-disk thereon having a series of concentric teeth, a counter-shaft, a sliding pinion thereon and adapted to engage each of said sets of concentric teeth, a yoke engaging said pinion, a stem adjustably attached to said yoke having indicating characters thereon and notches in the edge thereof adapted to be engaged by a stationary projection, and a spring to hold said stem in its adjusted position, substantially as specified.

3. In a device as described, a main driving-shaft, a counter-shaft adapted to be driven at different rates of speed thereby, a stepped pinion driven by said counter-shaft to transmit the movement thereof, and a shifting bracket adapted to support said stepped pinion in different positions on said counter-shaft, said bracket being further adapted to form an adjustable and self-alining supporting-bearing for said counter-shaft substantially as specified.

4. In a device as described, a main driving-shaft, a counter-shaft driven at different rates of speed thereby, a shiftable stepped pinion mounted on and driven by said counter-shaft to transmit the movement thereof, said pinion having an extended hub about said shaft, and a shifting bracket having a bearing for said hub, adapted to shift said pinion and form an adjustable and self-alining supporting-bearing for said counter-shaft substantially as specified.

5. In a change-of-speed device, a driven shiftable stepped pinion, a shiftable gear driven by said pinion, and having a beveled face on the rim thereof adapted to alternately engage similarly-beveled faces on said pinion to lock said gear in meshing position, substantially as and for the purpose specified.

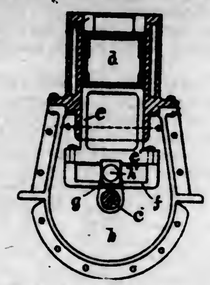
813,785. **SPRING-SCALE.** JOHN B. PAQUETTE, New Britain, Conn., assignor to Landers, Frary & Clark, New Britain, Conn., a Corporation. Filed Apr. 3, 1905. Serial No. 253,570.



Claim.—1. In spring-scales, the combination of a pinion with a slide extending upwardly above the said pinion, a rack pivotally mounted by its upper end to the said slide, and a presser device pivotally mounted on the said slide in position for engaging the said rack, and means for forcing the said pivotally-mounted presser device against the lower end of the said rack.

2. In spring-scales, the combination of a pinion with a slide extending upwardly above the said pinion, a rack pivotally mounted by its upper end to the said slide, and an angle-lever pivoted to the said slide near the lower end of the said rack, one arm of the said lever acting as a weight and the other arm acting as a presser device for holding the said rack in engagement with the said pinion.

813,736. EXPLOSIVE-ENGINE. GUSTAV PERSELOUSKI, Groton, Conn., assignor to The Thames Motor Company, New London, Conn., a Corporation of Connecticut. Filed Aug. 31, 1904. Serial No. 222,896.



Claim.—1. In combination, a crank-chamber section, a cylinder mounted upon and depending within said section, a shaft revolubly mounted in said section, a piston in said chamber, said piston being formed with a depending plate whose opposite edges are curved to conform to and engage the bore of the cylinder, a bar secured to the lower cross portion of said plate, with a space between them, and a crank and a traveler-block movable in said space and connecting the said plate and shaft.

2. The combination with the crank-chamber section, of a cylinder detachably mounted thereon and extended therewithin, a piston movable within said cylinder, a plate depending from and in addition to said piston and movable in said cylinder, the width of said plate being the same as the diameter of the piston-head and having its edge portions formed as arcs of a circle described by the bore of the cylinder to conform to and be guided by the inner wall of said cylinder, a crank-shaft revolubly mounted in said section, and crank mechanism connecting said shaft and piston through said plate.

3. The combination with a crank-chamber section and a cylinder mounted thereon and extended into said chamber, of a piston movable in said cylinder, a plate in addition to and depending from said piston into said chamber, a cross-bar detachably secured to the lower end of said plate, a traveler-block mounted to slide between said cross-bar and the lower end of said plate, a crank-shaft revolubly mounted in said crank-chamber section and connected with said block all substantially as shown and described.

813,737. WINDOW-VENTILATOR. WILLIAM A. RALSTON, Rochester, N. Y., assignor to Caldwell Manufacturing Company, Rochester, N. Y., a Corporation of New York. Filed Feb. 2, 1904. Serial No. 191,686.

Claim.—1. A ventilator comprising two semicircular plates pivoted together, and a base to which the inner or under one of said plates is fastened; said base having an opening through it in line with the fixed semicircular plate and provided above the opening with a concave surface opposite the movable semicircular plate; whereby the air passing through the base will strike said fixed plate and concave surface and be upwardly and inwardly deflected.

2. A ventilator comprising a base provided with a semicircular opening therethrough and having a concavity *c'* thereover, a stationary semicircular concave plate secured to the base over its semicircular opening, and a movable semicircular plate pivoted to said fixed plate over the said concavity for the purpose described.

813,738. RAIL-CLIP. LOUIS B. RENDER, Chicago, Ill. Filed Nov. 17, 1905. Serial No. 287,815.

Claim.—1. In a rail-clip, the combination of two separate metal parts provided with coincident bolt-openings and each having recesses for engaging flanges of both the rail and tie, and a bolt passing through said openings with means thereon for tightening the parts in clamping engagement with the rail and tie.

2. In a rail-clip, the combination of two separate metal parts provided with coincident bolt-openings and with flaring recesses inclined one with relation to the other fitting and engaging the flanges of both the rail and tie, and a bolt passing through said openings with means thereon for tightening the parts in clamping engagement with the rail and tie.

3. In a rail-clip, the combination of two separate metal parts provided with coincident flaring bolt-openings and flaring and inclined recesses fitting and engaging flanges of both said rail and tie, and a bolt passing through said openings with means thereon for tightening the parts in clamping engagement with the rail and tie.

4. In a rail-clip, the combination of a metal part comprising a bar having an upper surface to bear against the under surface of the rail, a longitudinally-extending recess in one side to engage a flange of the tie, a boss having a recess to engage a flange of the rail and a boss provided with a bolt-opening, a separate metal part having a bolt-opening and recesses, one of which engages a flange of the tie and the other a flange of the rail, and a bolt passing through said openings with means thereon for tightening the parts in clamping engagement with the rail and tie.

813,739. DEVICE FOR CUTTING VEGETABLE AND OTHER GROWTHS FROM THE INNER SURFACES OF SEWER AND SIMILAR PIPES. CHARLES W. ROSS, Newton, Mass. Filed Mar. 3, 1905. Serial No. 248,206.

Claim.—1. A device for cutting vegetable and other growths from the inner surfaces of sewer and similar pipes, the same having a cutter presenting a series of cutting edges differentially arranged in their position with respect to the longitudinal center of said device, whereby the growth or deposit in said pipe is sliced as the device is moved or caused to operate therein.

2. A device for cutting vegetable and other growths from the inner surfaces of sewer and similar pipes, the same having a cutter presenting a series of cutting edges differentially and angularly arranged in their position with respect to the longitudinal center of said

device, whereby the growths or deposit in said pipe is sliced as the device is moved or caused to operate therein.

3. A device for cutting vegetable and other growths from the inner surfaces of sewer and similar pipes, the same having a yielding cutter presenting a series of cutting edges differentially arranged with respect to the longitudinal center of said device, whereby the growth or deposit in the pipe is sliced as the device is moved or caused to operate therein, whereby also said cutter is adapted to yield or be conformable to any obstruction in said pipe.

4. A device for cutting vegetable and other growths from the inner surfaces of sewer and similar pipes, the same having an extensible cutter presenting a series of cutting edges differentially arranged in their position with respect to the longitudinal center of said device, whereby the growth or deposit in the pipe is sliced as the device is moved or caused to operate therein, and whereby also said device is adapted to yield or be conformable to any obstruction in said pipe.

5. A device for cutting vegetable and other growths from the inner surfaces of sewer and similar pipes, the same having a cutter presenting a series of cutting edges differentially arranged in their positions with respect to the longitudinal center of said device, which cutter also is extensible, and means for limiting the extension thereof.

6. A device for cutting vegetable and other growths from the inner surfaces of sewer and similar pipes, the same having a series of cutting edges arranged in a spiral coil, tapering toward the drawing end of said device, whereby as said device is moved or caused to operate in the pipe it will slice the growth or deposit therein with a spiral drawing cut.

7. A device for cutting vegetable and other growths from the inner surfaces of sewer and similar pipes comprising a metal bar bent in the form of a tapering spiral, which spiral is provided with a cutting edge, whereby the spiral is adapted to operate with a drawing cut of varying diameter as it is drawn endwise through the pipe, whereby the growth or deposit inside the pipe is sliced away.

8. A device for cutting vegetable or other growths from the inner surfaces of sewer and similar pipes comprising a metal bar bent in the form of a spiral tapering from the middle toward either end thereof, thereby forming two sections, which spiral sections are provided with cutting edges reversely disposed, whereby the spiral is adapted to operate with a drawing cut of varying diameter as it is drawn endwise in either direction through the pipe.

9. A device for cutting vegetable and other growths from the inner surface of sewer and similar pipes comprising a metal bar bent in the form of a spiral tapering from the middle toward either end thereof, thereby forming two sections, which sections are provided with cutting edges reversely disposed, whereby the spiral is adapted to operate with a drawing cut in opposite directions as it is drawn endwise in either direction through the pipe, which device also is extensible and the cutting edges yielding, and means inside the spiral for limiting the extension of the device while under strain or draft.

813,740. ARTIFICIAL LIMB. JAMES F. ROWLEY, Chicago, Ill. Filed Apr. 14, 1905. Serial No. 255,577.

Claim.—1. In an artificial limb, the combination of a leg-section, a socket member having endwise-sliding connection with said leg-section, yielding means normally urging the extension of the joint between said socket member and leg-section, a stop limiting said extension, and means for securing said socket member against movement with respect to said leg-section.

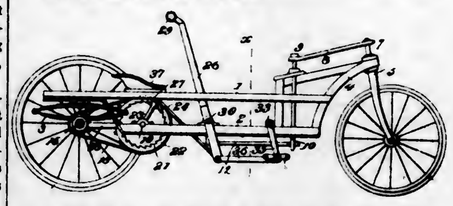
2. In an artificial limb, the combination of a leg-section, a socket member having endwise-sliding connection with said leg-section, and coacting locking means secured respectively to said socket member and said leg-section and adapted to be adjusted either to permit or to prevent their relative sliding movement.

3. In an artificial limb, the combination of a leg-section, a socket member having endwise-sliding connection with said leg-section, yielding means normally urging the extension of the joint between said socket member and leg-section, a stop limiting said extension, and a set-screw mounted on one of said parts and adapted to have threaded engagement with the other part when the joint between said parts is in its contracted position.

4. In an artificial limb, the combination of a leg-section; a socket member having endwise-sliding connection with said leg-section; metallic side straps rigidly connected with said leg-section and disposed longitudinally thereof at each side of said socket member, each of said straps having a longitudinal groove on its inner face and said socket member having a lug slidably seated in each of said grooves; a spiral spring seated in each of said grooves, bearing between the leg-section and the corresponding lug of said socket member and normally urging the extension of the joint between said socket member and leg-section; and a stop on said side straps for limiting the extension of said joint.

5. In an artificial limb, the combination of a leg-section; a socket member having endwise-sliding connection with said leg-section; metallic side straps rigidly connected with said leg-section and disposed longitudinally thereof at each side of said socket member, each of said straps having a longitudinal groove on its inner face and said socket member having a lug slidably seated in each of said grooves; a spiral spring seated in each of said grooves, bearing between the leg-section and the corresponding lug of said socket member, and normally urging the extension of the joint between said socket member and leg-section; a stop on said side straps for limiting the extension of said joint; a set-screw mounted in each of said side straps; and said socket member having therein threaded apertures for receiving said set-screws and securing said socket member and leg-section against relative movement.

813,741. VELOCIPEDE. CLAUS A. RUDEBECK, Gibson City, Ill. Filed Feb. 1, 1905. Serial No. 243,635.



Claim.—1. In a velocipede or analogous road-machine, the combination of propelling mechanism including a pivoted frame or lever, a pilot-wheel, and a steering-post operatively connected with said pilot-wheel and mounted in said frame or lever and having a universal joint approximately in line with the fulcrum or axis of said pivoted frame or lever, substantially as and for the purpose specified.

2. In a velocipede or like road-machine, the combination of propelling mechanism including a frame or lever fulcrumed at a point between its ends, a steering-post composed of sections, one of said sections being mounted in said frame or lever and the other section mounted in the main frame of the machine, the two sections being connected by means of a universal joint approximately in line with the fulcrum or axis of the pivoted frame or lever, a pivot-wheel, and connection means between said pilot-wheel and the section of the steering-post mounted in the main frame of the machine, substantially as set forth.

3. In a velocipede or like machine, the combination of propelling mechanism including a pivoted frame or lever, a pilot-wheel, a vertical shaft having crank connection with the frame of said pilot-wheel, a sectional steering-post having one section mounted in the machine-frame and connected with the aforesaid shaft and having the other section mounted in said pivoted frame or lever, and a universal joint connecting the two sections of the steering-post and approximately in line with the fulcrum of the axis of the pivoted frame or lever.

4. In a velocipede or kindred machine, the combination of propelling mechanism including a pivoted frame or lever, a steering-fork provided with a pilot-wheel, a vertical shaft, connecting means between said shaft and the steering-fork, and a steering-post composed of sections connected by means of a universal joint, one of said sections being mounted in the pivoted frame or lever and the other section mounted in the frame of the machine parallel with the aforementioned vertical shaft and connected therewith, the parts being arranged to admit of proper steering of the machine at any position of the aforesaid frame or lever.

5. In a velocipede or analogous machine, the combination of propelling mechanism including a pivoted frame or lever comprising similar side pieces transversely spaced and connected by cross-

pieces, a steering-fork provided with a pilot-wheel, a sectional steering-post located in the space formed between the side pieces of the aforesaid pivoted frame, one of the sections being mounted in the

3. In a cloth-winding machine, the combination of the winding-mandrel and the series of pressure-rolls, with the stationary slotted disks in which the pressure-rolls are journaled, and the connected

tent, the lock also having a shoulder near its upper end engaging the inner end of the outer horizontal arm of the knuckle-thrower when

having a depending arm to engage the knuckle-tail, and an upper arm fitting outside the draw-head and resting on the top thereof and

pieces, a steering-fork provided with a pilot-wheel, a sectional steering-post located in the space formed between the side pieces of the aforesaid pivoted frame, one of the sections being mounted in the cross-pieces connecting said side pieces and the other section mounted in a part of the machine-frame having connection with said steering-fork, and a universal joint connecting the two sections of the steering-post to admit of the machine being properly guided at any position of the aforementioned pivoted frame or lever.

6. In combination, an axle provided with a drive-wheel, a shaft connected with said axle, a ratchet-wheel fast upon said shaft, a supporting-arm mounted coaxially with said shaft, a pawl loose upon said supporting-arm, a pivoted frame or lever, connecting means between said frame and pawl for positive actuation of the latter in each direction, a crank-shaft having crank-arms connected with the pivoted frame, a steering-fork provided with a pilot-wheel, a steering-post composed of sections connected by means of a universal joint, one of said sections being mounted in the pivoted frame and the other in the frame of the machine, and connecting means between the steering-fork and the section of the steering-post mounted in the frame of the machine, substantially as set forth.

813,742. VELOCIPEDE. CLAUS A. RUDEBECK, Gibson City, Ill. Filed June 23, 1905. Serial No. 266,605.

Claim.—1. In a machine of the character set forth, the combination of a sectional steering-post, a pilot-wheel, connections between the pilot-wheel and a section of the steering-post, and a clutch between the other section of the steering-post and the machine-frame.

2. In a machine of the character described, the combination of a pilot-wheel, a steering-post composed of sections having a universal-joint connection, one of said sections being mounted to turn only and having connection with the pilot-wheel and the other section mounted to have both a turning and a vibratory movement, and a clutch between the last-mentioned section and the supporting-frame therefor.

3. In a machine of the character set forth, the combination of the main frame, a pilot-wheel, a lever-frame, a sectional steering-post having its sections connected by a universal joint in transverse alinement with the fulcrum of the lever-frame, a vertical post journaled to the main frame and provided at its upper and lower ends with cross-bars, connections between the ends of the respective cross-bars and corresponding ends of similar cross-bars of the pilot-wheel and lower section of the steering-post, and a clutch between the upper section of the steering-post and the lever-frame.

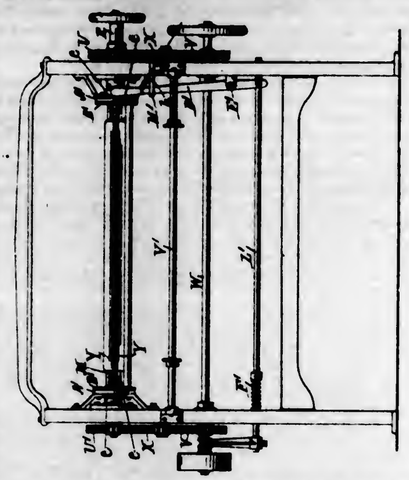
4. In a machine of the character described, the combination of the main frame comprising upper and lower longitudinal bars, a pilot-wheel, a lever-frame having its side members offset and pivoted near their lower ends to the lower longitudinal bars of the frame, the upper portions of said members passing between the upper longitudinal bars, a sectional steering-post having its upper section journaled in the lever-frame and its lower section journaled to the machine-frame, a universal joint connecting the two sections and in transverse alinement with the pivot-supports of the lever-frame members, a brace connecting the members of the lever-frame, a clutch comprising a member fast with the upper section of the steering-post and a pivoted member mounted upon said brace, connecting means between the pilot-wheel and the lower section of the steering-post, and connecting means between the said lever-frame and the drive-axle.

813,743. CLOTH WINDING AND MEASURING MACHINE. JOSEPH J. SCHOLFIELD, Providence, R. I. Filed July 6, 1903. Serial No. 164,469.

Claim.—1. In a cloth-winding machine, the combination of the rotary spindle, the head jointed to the forward end of the rotary spindle, and the yielding arms connected to the said head, the said head and yielding arms forming the outer portion of a winding-mandrel, with a longitudinally-movable spindle and an inner mandrel portion having a head which engages with the end of the longitudinally-movable spindle, substantially as described.

2. In a cloth-winding machine, the combination of the revolving spindle, the winding-mandrel made in two parts, one of which is jointed to the revolving spindle, with the series of pressure-rolls, and means for imparting simultaneous movement thereto, toward or from the mandrel, substantially as described.

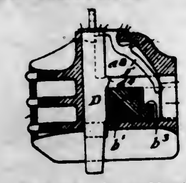
3. In a cloth-winding machine, the combination of the winding-mandrel and the series of pressure-rolls, with the stationary slotted disks in which the pressure-rolls are journaled, and the connected cam-disks, by means of which the pressure-rolls are adjusted, substantially as described.



4. In a cloth winding and measuring machine, the combination of the winding-mandrel, the series of pressure-rolls adapted for movement toward and from the mandrel, with the measuring-roll, the notched disk operatively connected with the shaft of the measuring-roll, the spring-actuated disengaging-lever adapted for engagement with the notched disk, the spring-actuated catch-bolt, and the spring-actuated shipper-lever released by the movement of the disengaging-lever, substantially as described.

5. In a cloth winding and measuring machine, the combination of the winding-mandrel, the measuring-roll, the notched disk operatively connected with the shaft of the measuring-roll, the spring-actuated disengaging-lever adapted for engagement with the notched disk, the spring-actuated catch-bolt and the spring-actuated shipper-lever released by the movement of the disengaging-lever, with the rotary cutter, and means for holding the forward end of the severed web, substantially as described.

813,744. CAR-COUPLING. WILLIAM S. SCHROEDER, Chicago, Ill. Filed Nov. 27, 1903. Serial No. 182,149.



Claim.—1. In a car-coupler, the combination of a draw-head, pivotal knuckle and locking-pin, with a knuckle-thrower having a depending arm to engage the knuckle-tail to throw the knuckle open, and an upper horizontal arm fitting outside the draw-head on top thereof, the lock having a shoulder engaging the inner end of said horizontal arm of the knuckle-thrower when the lock is lifted the required extent, the lock also having a shoulder near its upper end engaging the inner end of the outer horizontal arm of the knuckle-thrower when the lock is in its lowermost position to hold the depending arm of the knuckle-thrower free from the knuckle-tail, substantially as specified.

2. In a car-coupler, the combination of a draw-head, a pivotal knuckle and locking-pin, with a knuckle-thrower having a depending arm to engage the knuckle-tail to throw the knuckle open, and an upper horizontal arm fitting outside the draw-head on top thereof, the lock having a shoulder engaging the inner end of said horizontal arm of the knuckle-thrower when the lock is lifted the required extent, the lock also having a shoulder near its upper end engaging the inner end of the outer horizontal arm of the knuckle-thrower when the lock is in its lowermost position to hold the depending arm of the knuckle-thrower free from the knuckle-tail, the knuckle-thrower having a shoulder or projection fitting under a lip of the draw-head to prevent the knuckle-thrower being removed from the draw-head unless the knuckle is first removed, substantially as specified.

3. In a car-coupler, the combination with a draw-head, of a knuckle, a lock and a knuckle-thrower having an upper arm fitting outside of and resting upon the top of the draw-head, the lock having a longitudinal notch and shoulders engaging the inner end of said upper outside arm of the knuckle-thrower, substantially as specified.

4. In a car-coupler, the combination with a draw-head, of a knuckle, a lock and a knuckle-thrower having an upper arm fitting outside of and resting upon the top of the draw-head, the lock having a longitudinal notch and shoulders engaging the inner end of said upper outside arm of the knuckle-thrower, and the knuckle-thrower having a shoulder or projection fitting under the web or lip of the draw-head to prevent the removal of the knuckle-thrower unless the knuckle is first removed, substantially as specified.

5. In a car-coupler, the combination with a draw-head, of a knuckle, a lock, a knuckle-thrower having a depending arm engaging the knuckle-tail, and an arm fitting outside the draw-head on the top thereof, the lock having a shoulder engaging the inner end of said last-mentioned arm when the lock is lifted to the required extent, the lock having also an upper shoulder engaging said inner end of said knuckle-thrower when the lock is in its lowermost position, substantially as specified.

6. In a car-coupler, the combination with a draw-head, of a knuckle, a lock, a knuckle-thrower having a depending arm engaging the knuckle-tail, and an arm fitting outside the draw-head on the top thereof, the lock having a shoulder engaging the inner end of said last-mentioned arm when the lock is lifted to the required extent, the lock also having an upper shoulder engaging said inner end of said knuckle-thrower arm when the lock is in its lowermost position, the knuckle-thrower being provided with a shoulder or projection fitting under a lip or web with which the draw-head is provided, substantially as specified.

7. In a car-coupler, the combination with a draw-head, of a knuckle, a lock, a knuckle-thrower having a depending arm engaging the knuckle-tail, and an arm fitting outside the draw-head on the top thereof, the lock having a shoulder engaging the inner end of said last-mentioned arm when the lock is lifted to the required extent, the lock also having an upper shoulder engaging said inner end of said knuckle-thrower arm when the lock is in its lowermost position, the knuckle-thrower being provided with a shoulder or projection fitting under a lip or web with which the draw-head is provided, the tail of the knuckle having a notch or recess to receive the lower end of the depending arm of the knuckle-thrower, substantially as specified.

8. In a car-coupler, the combination with a draw-head, of a knuckle, a locking-pin, having a lock-set leg and lock-set shoulder, and provided with a shoulder to engage a knuckle-thrower, of a knuckle-thrower having a depending arm to engage the knuckle-tail, and an upper arm fitting outside the draw-head and resting on the top thereof and engaged at its inner end by said knuckle-throwing shoulder on the locking-pin, substantially as specified.

9. In a car-coupler, the combination with a draw-head, of a knuckle, a locking-pin, having a lock-set leg and lock-set shoulder and a shoulder to engage a knuckle-thrower, of a knuckle-thrower having a depending arm to engage the knuckle-tail, and an upper arm fitting outside the draw-head and resting on the top thereof and engaged at its inner end by said knuckle-throwing shoulder on the locking-pin, said locking-pin having also a second shoulder to engage said upper arm of the knuckle-thrower when the knuckle is closed, substantially as specified.

10. In a car-coupler, the combination with a draw-head, of a knuckle, a locking-pin, having a lock-set leg and lock-set shoulder, and a shoulder to engage a knuckle-thrower, of a knuckle-thrower having a depending arm to engage the knuckle-tail, and an upper arm fitting outside the draw-head and resting on the top thereof and engaged at its inner end by said knuckle-throwing shoulder on the locking-pin, said locking-pin having also a second shoulder to engage said upper arm of the knuckle-thrower when the knuckle is closed, and said knuckle-thrower having a shoulder or projection fitting under a lip on the draw-head to prevent the removal of the knuckle-thrower, substantially as specified.

11. In a car-coupler, the combination with a draw-head, of a knuckle, a locking-pin, having a lock-set leg and lock-set shoulder, and a shoulder to engage a knuckle-thrower, of a knuckle-thrower having a depending arm to engage the knuckle-tail, and an upper arm fitting outside the draw-head and resting on the top thereof and engaged at its inner end by said knuckle-throwing shoulder on the locking-pin, said locking-pin having also a second shoulder to engage said upper arm of the knuckle-thrower when the knuckle is closed, said knuckle-thrower having a shoulder or projection fitting under a lip on the draw-head to prevent the removal of the knuckle-thrower, the draw-head being provided on its upper face with a horizontal guide-face for the upper arm of the knuckle-thrower to permit the upper face of said arm to fit flush with the upper face of the draw-head surrounding the locking-pin opening therein, substantially as specified.

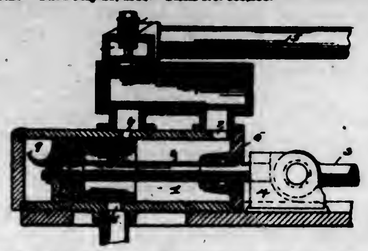
813,745. AERIAL TRAMWAY. ROLLEY C. SELF, Norman, Okla. Filed Sept. 13, 1905. Serial No. 278,313.

Claim.—1. In an apparatus of the class described, approaches disposed at opposite sides of the chasm to be crossed and anchored to the banks of the same, inclined braces forming part of the approaches and provided with a plurality of spaced sheaves, track-cables engaging said sheaves, a car mounted for travel on the track-cables, means for adjusting the tension of the cables, and a draw-cable secured to the bottom of the car for imparting movement to the latter.

2. In an apparatus of the class described, inclined approaches disposed at opposite sides of the chasm to be crossed and anchored to the banks of the same, inclined braces forming a part of the approaches and provided with a plurality of spaced track-engaging sheaves, a guide-sheave of greater diameter than the adjacent sheaves mounted for rotation between the inclined braces of each approach, track-cables engaging the track-sheaves, a car mounted for travel on the track-cables and provided with vertical standards having corresponding sheaves journaled therein for engagement with the track-cables, means for adjusting the tension of the track-cables, and a draw-cable secured to the bottom of the car and engaging the guide-sheaves for imparting movement to the car.

3. In an apparatus of the class described, inclined platforms disposed at opposite sides of the chasm to be crossed and anchored to the banks of the same, inclined braces secured to the platforms and provided with a plurality of spaced track-engaging sheaves, vertical braces disposed on opposite sides of the platforms and provided with similar sheaves, track-cables engaging the sheaves in the inclined braces and disposed above and below the platforms for engagement with the sheaves in the vertical braces, means for regulating the tension of the cables, a car mounted for travel on the track-cables, and a draw-cable secured to the bottom of the car and engaging guide-sheaves in the inclined braces for imparting movement to said car.

813,746. EXPLOSIVE-ENGINE. HENRY K. SHARDE, Cleveland, Ohio. Filed July 20, 1905. Serial No. 270,262.

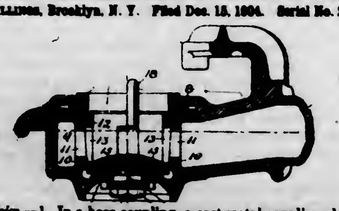


Claim.—1. In a twin-cylinder explosive-engine, the combination with the cylinders having closed ends, of duplicate compression-chambers independently mounted thereon and of predetermined less capacity than the cylinders therefor, each provided with a passage communicating with the front of its respective cylinder, an admission-port from each compression-chamber centrally placed in each cylinder between its ends, an exhaust-port for each cylinder arranged to exhaust in advance of the admission, a commingling-chamber arranged to bridge the compression-chambers, duplicate passages between the condensing-chambers and the bridge-chamber, automatic valves therein, an elongated spraying-tube entering the bridge-chamber between the compression-chambers, a valve at the outer end of the tube, air-inlets therefor, and a delivery-nozzle for the valve adapted to discharge vapor longitudinally of the tube, substantially as described.

2. In an explosive-engine, the combination with duplicate cylinders closed at both ends and duplicate pistons therein, of duplicate compression-chambers mounted thereon, of pronounced smaller capacity than the cylinders, duplicate passages at the forward ends of the cylinders connecting them with the compression-chambers, exhaust-ports arranged to exhaust in advance of the admission, admission-ports placed centrally of the cylinders communicating with the compression-chambers, duplicate deflectors curving upwardly and rearwardly from the backs of the pistons, a bridge-chamber connecting the compression-chambers, a spraying-tube inserted in said bridge-chamber, and duplicate valves and admission-ports between the bridge-chamber and compression-chambers, substantially as set forth.

3. A twin gas-engine comprising twin cylinders, pistons, duplicate independent compression-chambers mounted upon the cylinders and of pronounced smaller diameter than the cylinders, a bridge-chamber connecting the compression-chambers, automatic valves in said bridge-chamber communicating with the compression-chambers, and a horizontal spraying-tube communicating centrally with said bridge-chamber.

813,747. AUTOMATIC AIR-BRAKE COUPLING. ARTHUR H. SKILLINGS, Brooklyn, N. Y. Filed Dec. 15, 1904. Serial No. 236,894.

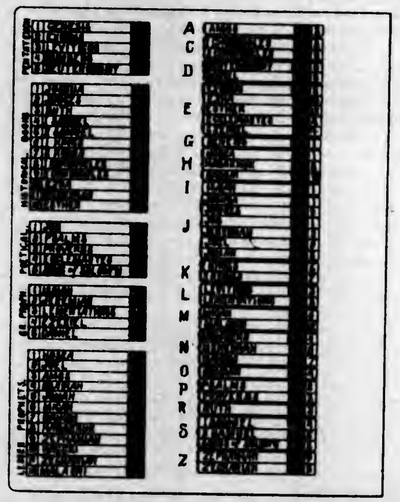


Claim.—1. In a hose-coupling, a cast-metal coupling-shell cast with an annular interior perforated partition adapted to form an annular chamber within the shell, a rotary cylinder-valve seated on the inner face of the annular partition or wall and having a taper from its end next the meeting face or front wall of the casting toward the rear wall of the shell, a stud or projection extending from said valve through an opening in the rear wall, and means cooperating with said stud to hold the valve down to its seat.

2. In a hose-coupling, the combination of rotary valve-cylinders, seated in the cooperating members of the coupling, and each provided with a stud or projection extending through the rear wall of the coupling-shell, a stop-piece secured against rotation on said stud and secured thereon outside the rear wall of the shell, and a cooperating stud formed on the outer face of said back or rear wall, as and for the purpose described.

3. In a hose-coupling, a cast-metal coupling-shell having an annular chamber formed by an interior wall or partition cast in one piece with the shell and perforated for cooperation with a valve-cylinder, said shell having a perforated back or rear wall provided with a cavity or depression on its exterior, as and for the purpose described.

813,748. BOOK-INDEX. LOUIS R. SMITH, Denver, Colo. Filed June 27, 1904. Serial No. 214,526.



Claim.—1. A volume-index in which the names of the books composing the volume are arranged in a column and in groups, the names comprising the various groups being printed in colors, all the names of each group having the same color, and the names of the books of each group being distinguished by a different color from the names of the books of any other group, the names of the same books being alphabetically arranged in another column and the names of the books in the alphabetical columns being distinguished by the same color as in the group-column.

2. A Bible-index in which the names of the books of either Testament are arranged in a column and grouped, each group containing the names of a number of books, the names of all the books of any group having the same color, and the names of the books of any group having a different color from the names of the books of any other group, the names of the same books being alphabetically arranged in another column and the names of the books in the alphabetical columns being distinguished by the same color as in the group-column.

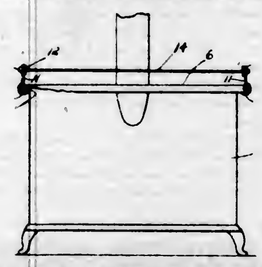
3. A Bible-index in which the names of the books of either Testament are arranged in a column and in groups, the names of the different groups having different colors, and all the names of any group having the same color, the names of the groups being arranged in the column in their order from the top to the bottom, the names of the group at the front of the volume being highest in the column, the names of the books next in order toward the back of the volume being next below and so on, the names of the same books being alphabetically arranged in another column and the names of the books in the alphabetical columns being distinguished by the same color as in the group-column.

4. A Bible-index in which the names of the books of either Testament are arranged in a column, and grouped, all the names of any group having the same color, and the names of any group having a different color from the names of any other group, and tabs applied to the edges of the leaves of the volume, corresponding in color and located directly opposite the names of the books in the index-column, the said index being secured to the lid of the book, substantially as shown and described.

5. A combined classification and alphabetical Bible-index comprising the names of the books of either Testament arranged in a column and in groups, all the names of any group being designated by the same color, and the names of any group having a different color from the names of any other group; the names of the same books being alphabetically arranged in another column, and the names of the books in the alphabetical column being distinguished by the same colors as in the grouped column.

6. A combined classification and alphabetical Bible-index comprising the names of the books of either Testament arranged in a column and in groups, all the names of any group being designated by the same color, and the names of any group having a different color from the names of any other group; the names of the same books being alphabetically arranged in another column, and the names of the books in the alphabetical column being distinguished by the same colors as in the grouped column, and tabs applied to the edges of the leaves of the volume to designate the different books, the said tabs being designated by colors corresponding with the colors of the index-columns and arranged directly opposite the corresponding books of the classified column.

813,749. RACK ATTACHMENT FOR STOVES. JOSHUA TERRY, Draper, Utah. Filed Apr. 13, 1905. Serial No. 255,196.



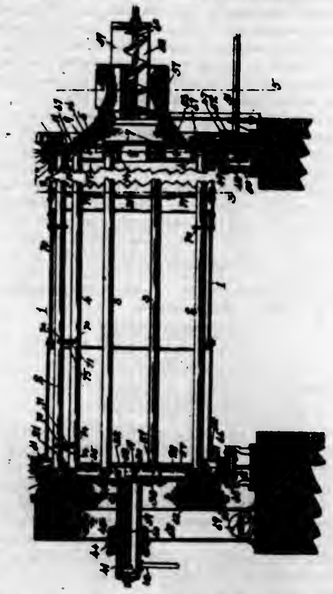
Claim.—1. A rack attachment for stoves comprising plates, depending members carried by the plates and having hooks at their lower ends adapted for engagement beneath the edge portion of a stove-top, members slidably mounted upon the first-named members above the hooks and adapted for movement into and out of position to rest against a stove-top with which the hooks are engaged to hold the latter against disengagement from the stove-top, means for holding the second-named members in operative position, and article-receiving devices carried by the plates.

2. In a rack attachment for stoves, the combination of two supporting members each consisting of a plate and a plurality of hooked members arranged at an angle to the plate, each hooked member being constructed and arranged for interlocking engagement with the rim of a stove and to bear upon the upper surface of said rim, and means for mutually connecting the supporting members and for holding said members against displacement when interlocked with the rim of a stove on opposite sides of a stove.

813,750. STEAM-DRIER. SOREN THORKELSEN, Louisville, Ky., assignor to Henry Vogt Machine Company, Louisville, Ky. Filed Nov. 15, 1905. Serial No. 287,830.

Claim.—1. In a steam-drier, a revolvable shell or casing, an intake-header provided with an inner chamber and an outer chamber, and passages connecting the inner and outer chambers, a discharge-header having an outer passage divided into sections or compartments by means of cross-walls, an inner steam-chamber, a series of hollow radial arms forming steam-passages leading from the inner steam-chamber to different sections of the outer chamber, a second series of hollow radial arms intermediate the arms of the first series and forming condensation-passages leading from the outer chamber inwardly to the center of the steam-chamber and adapted to discharge water of condensation therefrom, a steam-pipe entered into the steam-chamber, an outer circle of tubes connecting the outer chambers of the headers, an inner circle of tubes connecting the intake-header with the steam-chamber of the discharge-header, intermediate tubes leading from the intake-header to the hollow radial arms forming the steam-passages of the discharge-header, and means for imparting revolution to the headers, substantially as described.

2. In a steam-drier, an intake-header and a discharge-header having an outer passage divided into sections or compartments by means of cross-walls, a series of hollow radial arms, one for each of the compartments, forming steam-passages leading from the inner steam-chamber to the sections of the outer chamber and opening in each case near one end thereof, a second series of hollow radial arms intermediate the arms of the first series and forming condensation-passages, one for each section or compartment of the outer chamber leading inwardly from a point adjacent to the cross-wall and distant from the inlet-opening and adapted to discharge from the center of the header, an outer circle of tubes leading from the intake-header to the outer compartments of the discharge-header, an inner circle of tubes leading from the intake-header to the central steam-chamber of the discharge-header, and intermediate tubes leading from the intake-header to the arms forming the steam-passages connecting the central steam-chamber of the discharge-header with the outer sections or compartments, substantially as described.



3. In a steam-drier, an intake-header and a discharge-header having an outer passage divided into sections or compartments by means of cross-walls, a series of hollow radial arms, one for each of the compartments, forming steam-passages leading from the inner steam-chamber to the sections of the outer chamber and opening in each case near one end thereof, a second series of hollow radial arms intermediate the arms of the first series and forming condensation-passages, one for each section or compartment of the outer chamber leading inwardly from a point adjacent to the cross-wall and distant from the inlet-opening and adapted to discharge from the center of the header, an outer circle of tubes leading from the intake-header to the outer compartments of the discharge-header, an inner circle of tubes leading from the intake-header to the central steam-chamber of the discharge-header, and intermediate tubes leading from the intake-header to the arms forming the steam-passages connecting the central steam-chamber of the discharge-header with the outer sections or compartments, and a rotatably-mounted peripheral ring surrounding one of the headers within which the header is slidably mounted to allow for expansion and contraction, substantially as described.

4. In a steam-drier, the combination of an intake-header provided with an outer annular chamber, an inner annular chamber and connecting-passages leaving interstices or spaces for the admission of material, a feed-hopper adjacent to the intake-header, a discharge-header provided with an outer chamber consisting of separate compartments, an inner steam-chamber and connecting steam-passages and having an intermediate series of separate inwardly-extending condensation-passages, one for each section or compartment, for discharging water of condensation near the center of the header, an outwardly-extending discharge-neck secured to the center of the discharge-header for collecting the water of condensation, a fixedly-mounted discharge-head in alignment with the revolvable neck, a ball-bearing stuffing-box between the two, a centrally-located steam-

pipe leading to the steam-chamber, a drain-pipe leading from the discharge-head, inner, intermediate and outer tubes connecting the headers, and a shell or casing surrounding the tubes, substantially as described.

5. In a steam-drier, a discharge-header consisting of an outer chamber divided by means of cross-walls into separate compartments, an inner steam-chamber, a series of radiating-passages, one for each of the compartments, leading from the inner steam-chamber to the compartment, an intermediate series of separate inwardly-extending condensation-passages, one for each of the compartments, leading therefrom at a point adjacent to the cross-wall and having discharge-openings near the center of the header, an intake-header having an inner chamber, an outer chamber and radiating hollow arms, a series of outer tubes connecting the outer passages in the headers, a series of tubes connecting the inner chambers in the headers, and a series of intermediate tubes connecting the radiating steam-passages of the discharge-header with corresponding hollow arms of the intake-header, substantially as described.

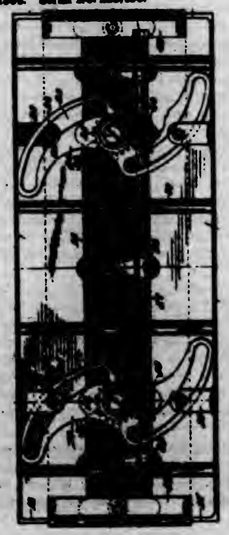
6. In a steam-drier, the combination of an intake-header, a discharge-header, an outer cylindrical shell or casing, a circle of outer tubes, an inner circle of tubes and a plurality of widely-separated intermediate tubes arranged close to tubes of the outer circle and forming in combination with each outer tube a plurality of widely-separated lodges adapted to give an irregular agitation to the material contained in the drier, the intermediate tubes being few in number as compared with the outer tubes, substantially as described.

813,751. MATCH-LIGHTER. ABSENT D. TROUPA, Sandwich, Ill. Filed Apr. 13, 1905. Serial No. 255,306.

Claim.—1. As an article of manufacture, a match-scratching device comprising a holder for sandpaper in the form of a plate having rolled flanges for engaging the margins of the paper, a flexible tongue springing from the plate, and a clasp secured to the tongue.

2. In a match-lighter, in combination, a plate having a rolled flange, a sheet of sandpaper applied to the plate and having its margin engaged by the rolled flange of the plate, a flexible tongue springing from the edge of the plate and overturned to bear upon the surface of the sandpaper, and means for securing the device to the garment of the user.

813,752. LOOSE-LEAF BINDER. HENRY A. TRUSSELL, St. Louis, Mo., assignor to Sieber & Trussell Mfg. Co., a Corporation of Missouri. Filed Dec. 5, 1904. Serial No. 235,499.



Claim.—1. An expansible binder-frame comprising a pair of side plates having instanding back leaves; an intermediate back plate in sliding engagement with such leaves; oscillating cam-plates pivoted on the intermediate back plate and having cam-slots oblique to their radii; members carried by the side plates and engaging the cam-slots; and means for oscillating the cam-plates.

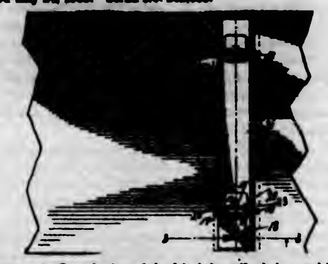
2. An expansible binder-frame comprising a pair of side plates having instanding back leaves; an intermediate back plate in sliding engagement with such leaves; oscillating cam-plates pivoted on the intermediate back plate and having cam-slots oblique to their radii; members carried by the side plates and engaging the cam-slots; a worm-shaft journaled on the intermediate back plate; and worm-gears mounted with the cam-plates and meshing with the worms of the shaft.

3. An expansible binder-frame comprising a pair of side plates having instanding back leaves; an intermediate back plate in sliding engagement with such leaves; oscillating cam-plates pivoted on the intermediate back plate and having curved cam-slots oblique to their radii; members carried by the side plates and engaging the cam-slots; and means for oscillating the cam-plates.

4. An expansible binder-frame comprising a pair of side plates having instanding back leaves; an intermediate back plate in sliding engagement with such leaves; oscillating cam-plates pivoted on the intermediate back plate and having cam-slots oblique to their radii; bifurcated brackets extending inwardly from the side plates and straddling the cam-plates, and pins set through the brackets and engaging the cam-slots.

5. In a loose-leaf binder, in combination, a pair of laterally-movable compression members, and levers for actuating such members and engaging the same by a cam-action and being arranged to act with increasing power as the compression members move toward each other.

813,753. LOOSE-LEAF BINDER. HENRY A. TRUSSELL, St. Louis, Mo., assignor to Sieber & Trussell Mfg. Co., a Corporation of Missouri. Filed May 24, 1905. Serial No. 262,656.



Claim.—1. In a device of the kind described, in combination, a back plate, a spring-opened arch secured thereto, and a cam acting in opposition to the spring to close the arch.

2. In a device of the kind described, in combination, a back plate, a spring-opened arch secured thereto, and a sliding cam acting in opposition to the spring to close the arch.

3. In a device of the kind described, in combination, a back plate; a spring-opened arch formed of a single rod curved to annular form and flattened to seat upon the plate and having its ends provided with interengaging faces; and a sliding cam acting on the side members of the arch to force them together.

4. In a device of the kind described, in combination, a back plate; a spring-opened arch formed of a single rod curved to annular form and flattened to seat upon the plate and having its ends provided with interengaging faces; a sliding cam acting on the side members of the arch to force them together; and a spring interposed and reacting between the side members of the arch.

5. In a device of the kind described, in combination, a back plate; a spring-opened arch having its meeting ends provided with interengaging faces; a spring for spreading the sides of the arch; a cam-plate slidingly seated on the back plate and having its edges upwardly flanged and beveled to engage the arch members to force them together.

813,754. RAILWAY-SWITCH. FREDERICK VOSS, Farmington, Ill. Filed June 12, 1905. Serial No. 264,670.

Claim.—1. In a switch mechanism the combination with main rails, siding-rails and movable points, of a shift-rod connected with the points for movement thereof into and out of position to close the siding, a cross-head carried by the switch-rod, guides for the cross-head, a lug carried by the cross-head, a plate pivoted to one of the guides and extending through the path of movement of the lug, a trip-block carried by a piece of rolling-stock and adapted for engagement of the plate to move the latter and the lug to shift the points, means for holding the plate with the points in position to close the siding, said trip-block being movable into and out of operative position and means located beyond the plate for moving the trip-block in inoperative position.

2. In a switch mechanism the combination with main-track rails, siding-rails and points movable into and out of position to close the siding, of means for moving the rails, a trip-block carried by a piece of rolling-stock and movable into and out of operative position, said trip-block when in operative position being adapted for engagement of point-moving means for operation thereof and a rail-brace located beyond the point-moving means and adapted for engagement of the trip-block after the latter has passed the point-moving means to move the trip-block into inoperative position.

3. In a switch mechanism the combination with main rails, siding-rails and points movable into and out of position to close the siding, of a shift-rod connected with the points for movement thereof and extending laterally beyond the rails, forward and rearward guides located at opposite sides of the shift-rod, a cross-head carried by the outer end of the shift-rod and slidably engaged between the guides, a segmental plate pivotally connected at its forward portion with the forward guide and extending across the shift-rod between the cross-head and the rails, a lug carried by the cross-head said plate lying in the path of movement of the lug, said plate being adapted for engagement by the lug and for movement therewith to extend toward the rails when the switch is in open position, a track instrument carried by a piece of rolling-stock and adapted for engagement of the plate when in its last-named position to move the plate and therewith the lug to close the switch and means for holding the plate with the switch in closed position.

4. The combination with a locomotive, of vertical guides carried thereon, trip-blocks slidably mounted in the guides and having spaced ears at their upper ends, a rock-shaft mounted adjacent to the guides and having cranks at its ends, said cranks being pivoted between the ears of the trip-blocks, a finger carried by the rock-shaft, an arm pivoted to the finger, an operating-lever pivoted to the arm and means for holding the lever at different points of its movement in one direction.

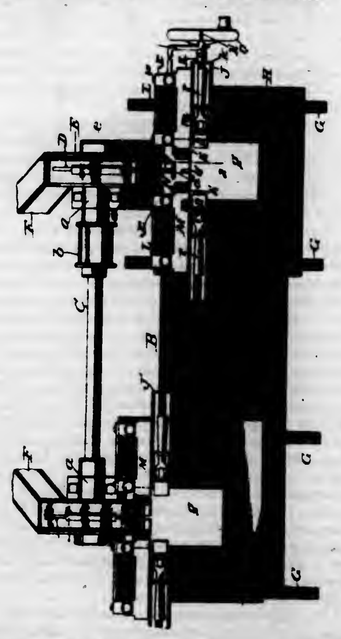
813,755. BRACELET. WALFRED WALLENSTEIN, Attleboro, Mass., assignor to Bates & Bacon, Attleboro, Mass., a Firm. Filed July 24, 1905. Serial No. 270,913.

Claim.—1. In a bracelet having a pivot or swing hinge, a concealed catch comprising a member having a protruding end in which is a transverse hole merging into a side opening which extends from the hole outward through the end and a member having a protruding hook-shaped end adapted to enter the side opening and the transverse hole in the first member, and means for securing the members of the catch in the bracelet, as described.

2. A concealed bracelet-catch comprising a member c having the body portion c', the end c^2 in which is the transverse hole c^3 merging into the side opening c^4 which extends from the hole c^3 outward through the end c^2, and the member f having the body portion f' and the hook-shaped end f^2 shaped to enter the transverse hole c^3 through the opening c^4, and means for securing the members c and f in a bracelet, as described.

3. The combination with a bracelet composed of two tubular halves a and b and a pivot-hinge c, the half a having the end a' for the hinge c, and the end a^2 in which is the side notch a^3, and the half b having the end b' for the hinge c and the end b^2, of a concealed catch d comprising the members c and f, the member c having the body portion c', the protruding end c^2 in which is the transverse hole c^3 merging into the side opening c^4 which extends from the hole c^3 outward through the end c^2 and the longitudinal cut-away portion c^5 which in connection with the inner wall of the end a^2 of the bracelet forms a vent c^6, the member f having the body portion f' and the protruding hook-shaped end f^2 shaped to enter the transverse hole c^3 through the notch a^3 in the end a^2 of the bracelet and the opening c^4 in the end of the member c and the longitudinal cut-away portion f^4 which in connection with the inner wall of the end b^2 of the bracelet forms a vent f^5, means for securing the member c in the end a^2 of the bracelet, and means for securing the member f in the end b^2 of the bracelet in a position to form the recess f^3 in the end b^2 for the protruding end c^2 of the member c, as described.

813,756. FOLIO-MORTISING MACHINE. FERDINAND WIEBE, Brooklyn, N. Y. Filed Jan. 14, 1905. Serial No. 241,128.



Claim.—1. In a folio-mortising machine, the combination of a vertically-movable cutter, a carriage movable horizontally toward and from the edge of the cutter and having a notch in its forward edge to receive the edge of the cutter, and a gage carried by and resting above the carriage and provided with means for determining the position of a plate relative to said notch of the carriage.

2. In a folio-mortising machine, the combination of a vertically-movable cutter, a carriage movable horizontally toward and from the edge of the cutter and having a notch in its forward edge to receive the edge of the cutter, and a gage carried by and resting above the carriage and having a graduated scale extending in the same direction as the notch in the carriage.

3. In a folio-mortising machine, the combination of a vertically-movable cutter, a carriage movable horizontally toward and from the edge of the cutter and having a notch in its forward edge to re-

ceive the edge of the cutter, and a gage carried by and resting above the carriage and having oblong openings extending parallel to the notch in its forward edge to receive the cutter and notches in its rear

813,759. SUPPORT FOR HORSES' HEADS. JOSEPH B. WILLIAMS and HERMANN C. BROWN, Somerville, Col. Filed Nov. 21, 1904.

Claim.—1. In a device of the character described, the combination with a tank or reservoir, measuring-receptacles connected the re-

ceive the edge of the cutter, and a gage carried by and resting above the carriage and having oblong openings extending parallel to the notch in the carriage and arranged at opposite sides of and equidistant from the plane of said notch and also having a graduated scale extending in the same direction as the notch in the carriage.

4. In a folio-mortising machine, the combination of a vertically-movable cutter, a carriage movable horizontally toward and from the edge of the cutter and having a notch in its forward edge to receive the edge of the cutter, a gage carried by and resting above the carriage and having a notch in its forward edge registered with the notch in the carriage and also having a slot at the rear end of its notch extending at right angles to said notch, and plate-holding means movable on the carriage at a right angle to the direction of movement of the cutter and the direction of movement of the carriage.

5. In a folio-mortising machine, the combination of a vertically-movable cutter, a carriage movable horizontally toward and from the edge of the cutter and having a notch in its forward edge to receive the edge of the cutter, a gage on the carriage provided with means for determining the position of a plate relative to said notch, plate-holding means movable on the carriage at a right angle to the direction of movement of the cutter and the direction of movement of the carriage, means for moving the plate-holding means with respect to the carriage, and means for determining the extent of movement of the plate-holding means with respect to the carriage.

6. In a folio-mortising machine, the combination of a vertically-movable cutter, a carriage movable horizontally toward and from the edge of the cutter and having a notch in its forward edge to receive the edge of the cutter, a gage on the carriage provided with means for determining the position of a plate relative to said notch, plate-holding means movable on the carriage at a right angle to the direction of movement of the cutter and the direction of movement of the carriage, and having a depending nut, a screw-bearing in the carriage and engaging the nut of the plate-holding means and having a wheel provided with a mark, and a pointer on the carriage arranged to coöperate with said mark on the wheel.

7. In a folio-mortising machine, the combination of a vertically-movable cutter, a carriage movable toward and from the cutter and having a notch in its forward edge, and plates for determining the width of the said notch; the said plates being adjustably connected to the carriage, and one of the same having an arm lapping the other at the back thereof.

8. In a folio-mortising machine, the combination of a vertically-movable cutter, a carriage movable horizontally toward and from the cutter, a plate-carrying slide movable on the carriage at a right angle to the direction of movement thereof, means for moving said slide with respect to the carriage, a bracket-arm adjustably connected to the slide, at one side of the carriage, and having a rib and also having means, at one side of the rib, for supporting a block interposed between the rib and the adjacent edge of the carriage.

9. In a folio-mortising machine, the combination of a vertically-movable cutter, a carriage movable horizontally toward and from the edge of the cutter and having a notch in its forward edge arranged to receive the edge of the cutter, a gage connected with the forward edge of the carriage and overhanging said carriage, and provided with means for determining the position of a plate relative to said notch of the carriage and plate-holding means movable on the carriage at a right angle to the direction of movement thereof.

10. In a folio-mortising machine, the combination of a cutter, a carriage movable toward and from the cutter, and having a groove extending at an angle to its direction of movement, bolts having enlargements disposed in said groove, clamps mounted on the bolts, springs supporting the clamps, and cam-levers mounted on the bolts, above the springs.

11. In a folio-mortising machine, the combination of a cutter, a carriage movable toward and from the cutter, a slide movable in the carriage at an angle to the direction of movement thereof and having a longitudinal groove, and also having a depending nut, bolts having enlargements disposed in said groove of the slide, clamps mounted on the bolts, springs supporting the clamps, cam-levers mounted on the bolts, above the springs, and a feed-screw carried by the carriage and bearing in the nut of the slide.

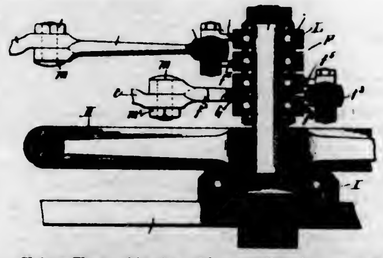
12. In a folio-mortising machine, the combination of a cutter, a carriage movable toward and from the cutter, plate-holding means on the carriage, and a gage carried by the carriage and having a notch in its forward edge to receive the cutter and notches in its rear edge parallel to the first-mentioned notch, and also having a longitudinal slot one longitudinal wall of which fixes the line of cut, and means whereby the depth of the cut in the plate may be determined.

13. In a folio-mortising machine, the combination of a cutter, a carriage movable toward and from the cutter, plate-holding means on the carriage, and a gage carried by the carriage and having a notch in its forward edge to receive the cutter and notches in its rear edge parallel to the first-mentioned notch and also having a longitudinal slot one wall of which fixes the line of cut, and a graduated scale parallel to one of the last-mentioned notches whereby the depth of the cut in the plate may be determined.

14. A gage for use on folio-mortising machines having a notch in its forward edge to receive a cutter, and notches in its rear edge parallel to the first-mentioned notch, and also having a slot one wall of which is to fix the line of cut, and a graduated scale parallel to the last-mentioned notches whereby the depth of the cut in a plate may be determined.

15. In a folio-mortising machine, the combination of a cutter, an abutment, a carriage movable toward and from the cutter and arranged to bring up, on its movement toward the cutter, against the abutment, and a gage carried by the carriage and having a notch to receive the cutter, and also having a longitudinal slot the rear wall of which is coincident with the line of cut, and further having means whereby the depth of the cut in a plate may be determined.

813,757. **POWER MECHANISM.** JOHN W. WIELBORG, Chicago, Ill. Filed Mar. 23, 1905. Serial No. 251,611.



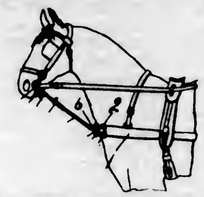
Claim.—The combination with a treadle, of a connecting-rod pivotally connected at one end thereto and shaped at the other end to form one of a pair of arms, the other arm of said pair hinged to said rod, a shaft, and clutch connections between the arms and the shaft.

813,758. **BRAKE-BEAM.** CHARLES H. WILLIAMS, Jr., Chicago, Ill., assignor to Chicago Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed July 21, 1905. Serial No. 270,084.

Claim.—1. In a trussed brake-beam, the combination with a thrust-block having a vertically-disposed tapered socket, the upper portion of said socket being the narrower, a removable brake-head having a tapered projection thereon for interlocking with said socket, the lower portion of said projection being the wider, a removable brake-shoe carried by said brake-head, and means on said brake-head for the connection of a brake-hanger; substantially as described.

2. In a trussed brake-beam, the combination of a thrust-block and a removable brake-head, one of said parts having a vertically-disposed tapered socket, the upper portion of which socket is the narrower, and the other of said parts having a tapered projection thereon for interlocking with said socket, the lower portion of said projection being the wider, a removable brake-shoe carried by said brake-head, and means on said brake-head for the connection of a brake-hanger, whereby, when the beam is hanging in position, the weight thereof will tend to more firmly seat the tapered wedge in its socket; substantially as described.

813,759. **SUPPORT FOR HORSES' HEADS.** JOSEPH B. WILLIAMS and EBENEZER C. BROWN, Somerville, Cal. Filed Nov. 21, 1904. Serial No. 233,776.

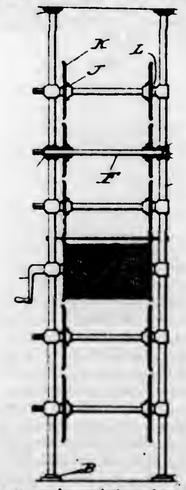


Claim.—1. A support for a horse's head comprising a part adapted to be attached to a part of the harness around the breast of the horse, a part adapted to be attached so as to rest underneath the chin of the horse, a tube attached to one of said parts, a rod attached to the other part and sliding in said tube, and a spring resisting the movement of the rod into the tube, substantially as described.

2. A support for a horse's head comprising a part adapted to be attached to the breast-strap, a part adapted to be attached so as to rest underneath the chin of the horse, a tube attached to one of said parts, a rod attached to the other part and sliding in said tube, said rod having a collar thereon, and a spring between said collar and the end of the tube, substantially as described.

3. A support for a horse's head comprising a part adapted to be attached to the breast-strap, a part adapted to be attached so as to rest underneath the chin of the horse, a tube attached to one of said parts, a rod attached to the other part and sliding in said tube, said rod having a collar thereon, and a spring between said collar and the end of the tube, the rod having a spring latch-hook secured thereto for engagement with the part to which it is attached, substantially as described.

813,760. **ROPE-RACK.** THOMAS WINTERBOTTOM, White Cloud, Kans. Filed Mar. 9, 1905. Serial No. 249,318.

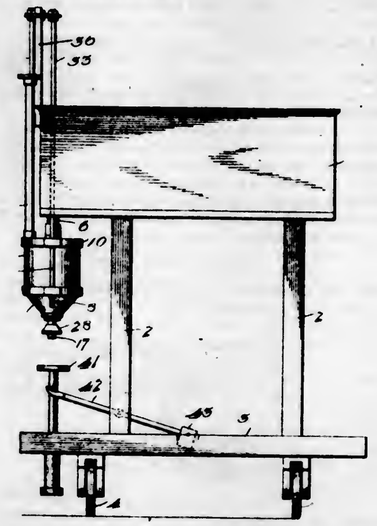


Claim.—1. A rope-rack consisting of vertical standards composed of tubular sections having threaded ends, couplings secured to said threaded ends, said couplings formed with journal-bearings, shafts mounted in said bearings, said shafts carrying reels to hold the rope and means for turning said shafts.

2. A rope-rack consisting of standards composed of tubular sections having threaded ends, couplings secured on said threaded ends, said couplings formed with bearings, shafts mounted in said bearings, and reels mounted on the shafts.

813,761. **DEVICE FOR FILLING BOTTLES.** JACOB H. WIDNER and GEORGE T. TOWNSLEY, Philadelphia, Pa. Filed Jan. 30, 1905. Serial No. 243,177.

Claim.—1. In a device of the character described, the combination with a tank or reservoir, measuring-receptacles connected therewith, and an inlet-valve and an outlet-valve in each receptacle, of independently-operated mechanisms attached to each of said receptacles, the mechanism attached to one receptacle being connected with the outlet-valve of such receptacle and with the inlet-valve of another receptacle, and adapted when said outlet-valve of one receptacle is opened to automatically cause the inlet-valve, with which it is connected, of the other receptacle to open, and which upon the closing of said outlet-valve will automatically cause the inlet-valve, with which it is connected, to close.



2. In a device of the character described, the combination with a tank or reservoir, and measuring-receptacles connected therewith, each of said receptacles having an air-vent and an inlet-opening in its top, and a contracted bottom terminating in a tube, a valve normally seated in the bottom over the tube, and a sliding collar on the tube of each receptacle connected with said valve, and a series of levers connecting the sliding collar of one receptacle with an air-vent and an inlet-opening of the opposite receptacle, and a weighted bottle-holder located beneath each of said tubes, whereby when a bottle is seated on said bottle-holder it will be raised automatically into contact with the sliding collar, raising the same and opening the outlet-valve of the receptacle, and at the same time, through the connecting-levers, automatically open the inlet and air-vent of the opposite receptacle.

3. In a device of the character described, the combination with a tank or reservoir, measuring-receptacles connected therewith and adapted to hold a predetermined quantity, and an inlet and outlet, and valves therefor, for each receptacle, of means adapted to be operated by the placing in position of a vessel beneath one of the receptacles to automatically open the outlet-valve of one receptacle, and mechanism connected therewith and operated thereby whereby the inlet-valve of an opposite receptacle is opened.

4. In a device of the character described, the combination with a tank or reservoir, measuring-receptacles connected therewith, an inlet and an outlet, and valves therefor, in each receptacle, of a valve opening and closing means at the lower end of each receptacle and connected with the outlet-valve thereof, and mechanism connecting said valve opening and closing means with the inlet-valve of an opposite receptacle, whereby said valve opening and closing means will, when actuated by the placing in position of a vessel beneath one of the receptacles, open the outlet-valves of such receptacle and at the same time automatically open the inlet-valve of the opposite receptacle, whereby when one receptacle is being emptied the other one is being filled.

5. In a device of the character described, the combination with a tank or reservoir, measuring-receptacles connected therewith, an inlet and an outlet, and valves therefor, and a float-valve for each

receptacle, of a valve-actuating mechanism at the lower end of each receptacle, and means connecting said valve-actuating mechanism with the inlet-valve of the opposite receptacle, whereby when the outlet-valve of one receptacle is opened by the placing in position of a vessel beneath one of the receptacles the inlet-valve of the opposite receptacle will be automatically opened thereby, to permit the filling of one receptacle while the other receptacle is being emptied.

6. In a device of the character described, the combination with a tank or reservoir, measuring-receptacles connected therewith, an inlet and an outlet, and valves therefor, and two air-vents and valves therefor for each receptacle, of a valve-actuating device at the bottom of each receptacle connected with the outlet-valve of such receptacle and also with the inlet-valve of the opposite receptacle by a series of levers, whereby when said valve-actuating device at the bottom of one receptacle is operated to open the outlet-valve of such receptacle by the placing in position of a vessel to receive the contents of such receptacle, the inlet-valve of the opposite receptacle will be automatically opened thereby.

7. In a device of the character described, the combination with a tank or reservoir, a measuring-receptacle connected therewith, an inlet and an outlet and suitable valves therefor, and two vents and a valve for each vent; of an overflow-tube over one of said vents, said tube being adapted to receive and hold the overflow from said receptacle occurring after the filling of such receptacle and before the closing of the inlet thereof.

813,762. OAR-LOCK. ANDREW ANDERSON, Mason, Wis. Filed Sept. 5, 1905. Serial No. 277,603.

Claim.—1. In an oar-lock, a socket-plate adapted for attachment to the gunwale of a boat and having an opening therein arranged to register with a bore in the gunwale, a collar formed around said opening in the socket-plate, the interior diameter of the collar being greater than that of the said opening forming an inner shoulder at the bottom of the collar, a standard-section having a bearing at its upper end, a stud extending downward from said bearing, the stud being reduced in diameter intermediate of its ends forming a shoulder adapted to rest on the upper edge of said collar, the said intermediate portion fitting loosely in the collar, the lower portion of the stud being further reduced in diameter forming a shoulder adapted to rest on the inner shoulder at the bottom portion of the collar, the lower reduced portion of the stud extending through the opening in the socket plate into the bore in the gunwale, and an oar-carrying section mounted to turn in the bearing of the standard-section, the said oar-carrying section being provided with a ring member in which the oar is adapted to turn.

2. In an oar-lock, a standard-section having a bearing at its upper end, the lower portion of the standard-section being fitted to turn in the gunwale of the boat, and an oar-carrying section consisting of a ring member having a horizontal cylindrical extension mounted to turn in the bearing of the standard-section, a split sleeve comprising two longitudinal sections secured to the oar, and passing loosely through said ring member, the split sleeve having an annular flange at one end, and a collar removably secured to the opposite end of the split sleeve, the said ring member being located between the said collar and the flange on the sleeve.

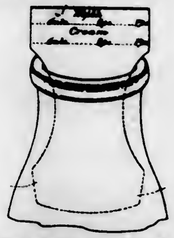
3. In an oar-lock, a standard-section having a horizontal bearing at its upper portion, a stud extending downward from the bearing and adapted to turn in the gunwale of a boat, an oar-carrying section comprising a ring member and a horizontal extension from the ring member, the said extension being mounted to turn in the bearing of the standard-section and having its outer end threaded, devices engaging the threaded end of the extension to hold the extension in position in the bearing, a bearing-sleeve secured to an oar and mounted to turn loosely in the said ring member, and means for preventing the bearing-sleeve from moving longitudinally in the ring member.

4. In an oar-lock, the combination with a socket-plate having an opening therein, a collar formed around the said opening, the interior diameter of said collar being greater than that of the said opening, of a standard-section, comprising an upper horizontal bearing, a stud extending down from the said bearing, reduced in diameter intermediate of its ends and at its lower end, forming an upper portion which rests upon the said collar and a lower portion which passes through the opening in the socket-plate, an oar-carrying section consisting of a ring member having a horizontal cylindrical extension loosely mounted in the bearing of the standard-section, devices for preventing the extension from slipping from the said bearing, a split sleeve loosely passed through the said ring member, the split sleeve having an annular flange near one end, and a collar removably located at the opposite end of the said split sleeve, being adapted for attachment thereto, the said ring member being located between the said collar on the sleeve and the flange of the sleeve.

813,763. SIFTER. ARCHIBALD O. ATKINSON, Louisville, Ky., assignor of one-half to Grace Jurt, Alexandria, Ind. Filed Jan. 23, 1905. Serial No. 242,378.

Claim.—A sifter comprising the combination with a receptacle, a screen forming the bottom therefor, said receptacle including a projecting rim at the bottom below the screen, a rod secured to said rim and passing diametrically across the receptacle, a resilient impacting member endwise movable on said rod for impacting said rim to shake or agitate the receptacle, said impacting member consisting of a coil-spring, apertured heads secured to the end of said coil-spring, said rod adapted to pass through the apertures of the heads, all being arranged substantially as shown and described.

813,764. ORDER-CARD. RALPH W. BAILEY, West Newbury, Mass., assignor of one-half to Conrad A. Stiles, Los Angeles, Cal. Filed Mar. 1, 1905. Serial No. 247,894.



Claim.—1. An order-card of material which is stiff, elastic and capable of receiving a clear pencil-mark, formed with recesses in its opposite sides intermediate its ends adapted to be inserted in the neck of a bottle in which the width of the opening is less than tha of the card at its ends and greater than that at the recesses.

2. An order-card formed of resilient material having a contracted intermediate portion and end portions of greater width, the card being adapted for insertion into a wide-mouthed bottle, the contracted portion adapted to reside within the contracted neck and the wide portions to engage the bottle above and below the neck portion to retain the card in position.

3. An order-card of stiff, resilient paper having a body portion formed with recesses in its sides intermediate its ends and having a detachable coupon, the body portion and coupon being provided with duplicate characters and blanks for indicating the character and quantity of the materials to be ordered.

4. An order-card adapted to be inserted in the mouth of a bottle, constructed of stiff, resilient paper and formed with a contracted portion adapted to occupy the contracted neck of the bottle, shoulders above said contracted portion adapted to engage and rest upon the periphery of the bottle-mouth, and resilient projections or tongues below said contracted portion adapted to expand after insertion in the bottle and engage the sides of the bottle below the contracted neck portion thereof.

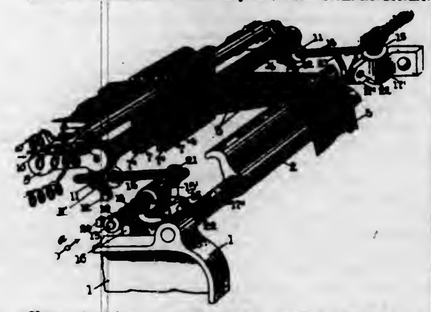
5. An order-card formed of resilient material having a contracted portion and an end portion of greater width, the card being adapted for insertion into a wide-mouthed bottle, the contracted portion adapted to reside within the contracted neck and the wide portion to engage the bottle above the neck portion to retain the card in position, the card being also provided with a locking projection.

6. An order-card consisting of a body portion having a recess in its side shaped to receive a portion of a bottle, and provided with an elastic locking projection and a supporting portion, and a detachable coupon connected to said body portion.

7. The combination with a bottle having a contracted neck, of an order-card having a narrow portion located within the mouth of the bottle, an end portion of greater width engaging and resting upon the rim of the bottle-mouth and a locking projection extending beneath a portion of the bottle for securing the card in place.

8. The combination with a bottle having a contracted neck, of an order-card constructed of material which is stiff, elastic and capable of receiving a mark, and formed with an intermediate part of less width than, and residing in, the mouth of the bottle, and end portions of greater width than said mouth and projecting laterally both above and below the contracted neck of the bottle.

813,765. WARP STOP-MOTION FOR LOOMS. HARRY G. BAKER, Worcester, Mass., assignor to Crompton & Knowles Loom Works, a Corporation of Massachusetts. Filed Sept. 26, 1905. Serial No. 280,426.



Claim.—1. A loom warp stop-motion, supported by the warp-threads, and movable up and down therewith in a vertical plane.

2. A loom warp stop-motion, supported by the warp-threads, and movable up and down therewith in a vertical plane, and adjustably connected with a stationary part of the loom.

3. A loom warp stop-motion, supported by the warp-threads, and movable up and down in a vertical plane, and adjustably connected with a stationary part of the loom, to be moved in the direction of the length of the warp-threads.

4. A loom warp stop-motion, supported by the warp-threads, and movable up and down therewith in a vertical plane, and means for lessening the weight of the warp stop-motion on the warp-threads.

5. A loom warp stop-motion, supported by the warp-threads, and movable up and down therewith in a vertical plane, and means for adjusting the weight of the warp stop-motion on the warp-threads.

6. A warp stop-motion for looms, comprising lease-rods and guide-rods for the drop devices, supported by the warp-threads to have a vertical up-and-down movement therewith, and means for connecting the lease-rods and guide-rods.

7. A loom warp stop-motion, supported by the warp-threads, and movable up and down therewith in a vertical plane, and connected with a stationary part of the loom.

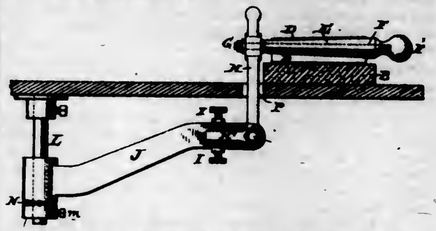
8. The combination with warp-threads divided into two planes which cross each other intermediate two lease-rods, of a warp stop-motion supported by said warp-threads and having as a part thereof said lease-rods.

9. The combination with warp-threads divided into two planes which cross each other intermediate two lease-rods, of a warp stop-motion supported by said warp-threads, and comprising said lease-rods, two end frames secured to said lease-rods, guide-rods or terminals for drop devices secured to said end frames, and said drop devices, and a central bar or terminal extending between the drop devices and secured to said end frames.

10. A loom warp stop-motion, comprising lease-rods and guide-rods for the drop devices, supported by the warp-threads to have a vertical up-and-down movement therewith, and means for lessening the weight of the warp stop-motion on the warp-threads.

11. The combination with a loom warp stop-motion, comprising lease-rods and guide-rods for the drop devices, supported by the warp-threads to have a vertical up-and-down movement therewith, of means for holding the warp stop-motion in its raised position.

813,766. BUNCHING-MACHINE FOR MAKING CIGARS. BENJAMIN H. BERMAN and ABRAHAM HABER, Philadelphia, Pa. Filed Apr. 28, 1905. Serial No. 257,842.



Claim.—1. In a bunching-machine, the combination of a die of yielding material, a loose apron having its ends secured adjacent to the ends of the die, a swinging arm pivoted to a support to one side of the die and having at its free end an adjustable part hinged to the arm on an axis in the plane of movement of the swinging arm and provided with a laterally-extending shaft, and a roller journaled upon said shaft and arranged between the apron and die, the construction being such that the vertical obliquity of the roller may be varied through the adjustable part on the end of the pivoted swinging arm.

2. In a bunching-machine, the combination of a die, a loose apron having its ends secured adjacent to the ends of the die, a pivoted swinging arm pivoted below the die and having an upwardly-arranged arm extending above the die and provided with a slot, a laterally-extending and overhanging transverse shaft arranged above the die and adjustably clamped in the slot of the upright arm to provide vertical adjustment, and a roller carried by the said shaft and arranged between the apron and the die.

3. In a bunching-machine, the combination of a die, a loose apron having its ends secured adjacent to the ends of the die, a pivoted swinging arm pivoted to the table below the die and having an upwardly-extending arm extending above the die, a transverse shaft arranged above the die adjustably connected to the upright arm with provision for vertical adjustment, a roller carried by the said shaft and arranged between the apron and the die, and pivoted means for adjusting the vertical obliquity of the roller relatively to the die and to the pivoted swinging arm.

4. In a bunching-machine, the combination of a die of yielding material, a loose apron having its ends secured adjacent to the ends of the die, a swinging arm consisting of a part swinging upon a fixed vertical axis and a second or upright part adjustably pivoted to the free end of the first-mentioned part on a transverse axis, means to adjust the second part in position upon the swinging arm, and a roller carried by the second part of the arm and arranged between the apron and die.

5. A bunching-machine of the character described having a die over which the bunch is rolled in a compressed form made throughout its entire length and width of rubber and having near one end a transverse depression, provided with an elastic shoulder at the juncture of said depression and the upper surface of the die over and against which the bunch may be forced and compressed under the elasticity of the said shoulder, and metallic clamping devices C C extending over the extreme ends and upper edges of the elastic die for holding it in position, and a loose apron having its ends secured to the said metallic clamps and its intermediate portion loosely supported over the die.

6. In a bunching-machine, the combination of a table, a die supported upon the table, a loose apron having its ends secured adjacent to the ends of the die, a swinging arm pivoted to a support at one side of the die and below the table and having an upright part extending upward above the table and to one side of the die, and a roller carried by the upright part and arranged between the apron and die for moving the apron and adjustably attached to vary its vertical obliquity relatively to the die.

7. In a bunching-machine the combination of a die having a groove at one end, a loose apron having its ends secured adjacent to the ends of the die, a swinging arm consisting of a part swinging

upon a fixed vertical axis and a second or upright part adjustably pivoted to the free end of the first-mentioned part on a transverse axis,

Claim.—1. In a machine of the class described, a measuring-wheel, a cam upon the axis of said wheel, a lever having an end ex-

5. The combination with the flue-sheets, of a leaky boiler-flue, of a tube within said flue for forming a chamber therein to close off the

813,770. CHANGEABLE-SPEED GEARING. ELLIS M. BURR, Champaign, Ill. Filed July 1, 1905. Serial No. 267,264.

upon a fixed vertical axis and a second or upright part adjustably pivoted to the free end of the first-mentioned part on a transverse axis, means to adjust the second part in position upon the swinging arm, and a roller carried by the second part of the arm and arranged between the apron and die.

8. In a bunching-machine, the combination of the table, a die having a groove at one end resting upon the table, a loose apron having its ends secured adjacent to the ends of the die, a swinging arm pivoted to a support at one side of the die and upon the under side of the table, an upright part adjustably connected with the free end of the arm and extending to a point above the table, a roller carried by the adjustable upright part of the arm and arranged between the apron and die, and adjustable means for connecting the roller to the upper end of the upright arm whereby it may be adjusted to or from the die as well as have its obliquity varied.

9. In a bunching-machine, the combination of a die having a groove at one end, a loose apron having its ends secured adjacent to the ends of the die, a pivoted swinging arm, a shaft adjustably clamped upon the pivoted swinging arm whereby it is adjustable obliquely to or from the die in a vertical direction, and a roller carried by the shaft and arranged between the apron and die.

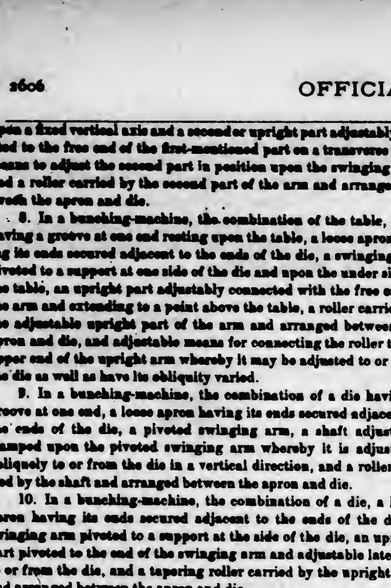
10. In a bunching-machine, the combination of a die, a loose apron having its ends secured adjacent to the ends of the die, a swinging arm pivoted to a support at the side of the die, an upright part pivoted to the end of the swinging arm and adjustable laterally to or from the die, and a tapering roller carried by the upright part and arranged between the apron and die.

11. In a bunching-machine, the combination of the die, the swinging arm J having the bell-crank portion H H′ adjustably pivoted at K and held in adjusted position by adjusting-screws I I, the shaft F secured to the part H of the bell-crank portion, a roller E journaled upon the shaft F, and loose apron D extending over the roller and die and having its ends secured adjacent to the ends of the die.

12. A bunching-machine having a die made of one continuous piece of elastic or yielding material in which the transverse groove B′ is formed, combined with metallic clamping devices independent of the die and at each end for directly holding the die in position, an apron having its ends clamped to the clamping devices, and a swinging arm having a laterally-extending portion arranged between the apron and die.

13. In a bunching-machine, a die upon which the tobacco fillers are rolled consisting of a thick flat block of rubber segmental in plan and having a transverse groove formed in the upper surface of the body of the rubber near one end the said die being elastic throughout its entire length.

818,767. CLOTH MEASURING AND MARKING MACHINE. JAMES F. BOGGS, Needles, Cal. Filed Sept. 26, 1905. Serial No. 280,215.



Claim.—1. In a machine of the class described, a measuring-wheel, a cam upon the axis of said wheel, a lever having an end extended into the path of said cam, a spring supporting the opposite end of the lever, a marking-wheel supported for rotation upon said lever, and a spring-pawl supported in constant engagement with notches in the said marking-wheel.

2. A measuring-wheel, a cam upon the axis of said wheel, a lever having an end extended into the path of said cam to be operated thereby, a spring supporting the lever on the opposite side of its fulcrum, a marking-wheel supported for rotation upon the spring-supported end of the lever, said wheel being provided with spaced type-carrying lugs, and a spring-pawl supported in constant engagement with the lugs and the spaces therebetween.

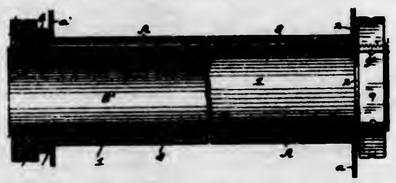
3. A measuring-wheel, a lever supported in the path of and adapted to be tripped by means connected with the measuring-wheel, a marking-wheel supported for rotation by the lever, means for advancing said marking-wheel one step at each operation of the lever, a platen beneath the marking-wheel, and means for advancing an adhesive-coated strip between the marking-wheel and the platen.

4. A vibratory lever, a marking-wheel supported for rotation upon the said lever, a platen beneath said marking-wheel, means for advancing the latter one step at each vibration of the supporting-lever, means for advancing an adhesive-coated strip between the platen and the marking-wheel, and cutting means connected with the lever adjacent to the marking-wheel.

5. A marking-wheel, a vibratory lever supporting said wheel, means for advancing the marking-wheel one step at each vibration of the supporting-lever, a platen supported beneath the wheel having a shoulder or offset, means for applying ink to the face of the wheel, means for advancing an adhesive-coated strip between the wheel and the platen, and a cutter connected with the lever adjacent to the wheel and coöperating with the shoulder of the platen to sever the portion of the strip advanced beyond the wheel when the latter is depressed.

6. A marking-wheel, a vibratory lever supporting said wheel, a shouldered platen beneath said wheel, means for applying ink to the face of the wheel, means for advancing an adhesive-coated strip between the wheel and the platen, a cutter connected with the lever and coöperating with the shouldered platen, and a member pivoted adjacent to the cutter and terminating at it free end in a presser-foot.

818,768. BOILER-TUBE. WILLIAM C. BRACKEN, Gallitzin, Pa. Filed Aug. 23, 1905. Serial No. 275,471.



Claim.—1. The combination with the flue-sheets, of a leaky boiler-flue extending through said sheets, a tube within said flue for forming a chamber therein to close off the leak and for permitting the passage of the smoke through the same, and means fitting against said flue-sheets for forming a tight joint and for securing said tube in place.

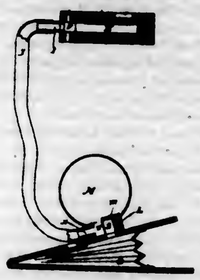
2. The combination with the flue-sheets, of a leaky boiler-flue extending through said sheets, a tube within said flue for forming a chamber therein to close off the leak and for permitting the passage of the smoke through the same, and means on the ends of said tube and fitting against said flue-sheets for forming a tight joint and for securing the same in place.

3. The combination with the flue-sheets, of a leaky boiler-flue extending through said sheets, of a tube within said flue for forming a chamber therein to close off the leak and for permitting the passage of the smoke through the same, and nuts engaging with the ends of said tube and fitting against said flue-sheets for forming a tight joint securing the same in place.

4. The combination with the flue-sheets, of a leaky boiler-flue, of a tube within said flue for forming a chamber therein to close off the leak and for permitting the passage of the smoke through the same, washers around the ends of said tube, and nuts engaging with the ends of said tube and with said washers and pressing the same against the flue-sheets to form a tight joint and secure said tube in place.

5. The combination with the flue-sheets, of a leaky boiler-flue, of a tube within said flue for forming a chamber therein to close off the leak and for permitting the passage of the smoke through the same, yielding washers around the ends of said tube, a metal washer around one end of said tube, and nuts engaging with the ends of said tube and with said washers and pressing the same against the flue-sheets to form a tight joint and secure said tube in place.

818,769. TUNING INSTRUMENT. MILES BRYANT, Battle Creek, Mich. Filed Dec. 5, 1902. Serial No. 133,974.



Claim.—1. In a device of the class described, the combination of a reed block or box D, having reed-chambers therein; openings G for said chambers arranged toward the rear thereof; reeds suitably supported in said chambers; a face-plate for said reed-block having air-delivery passages F opening into said reed-chambers; vent-passages E in said face-plate opening into said passages F; a bellows; an elastic storage-chamber therefor; a flexible delivery-pipe connected to said storage-chamber, having a tip adapted to be inserted into said air-delivery passages F, all coacting for the purpose specified.

2. In a device of the class described, the combination of a reed block or box D having reed-chambers therein; openings G for said chambers arranged toward the rear thereof; reeds suitably supported in said chambers; a face-plate for said reed-block having air-delivery passages F opening into said reed-chambers; vent-passages E in said face-plate opening into said passages F; a suitable air-supply; and a flexible delivery-tube adapted to be connected to the air-delivery passages of said air-chambers, all coacting for the purpose specified.

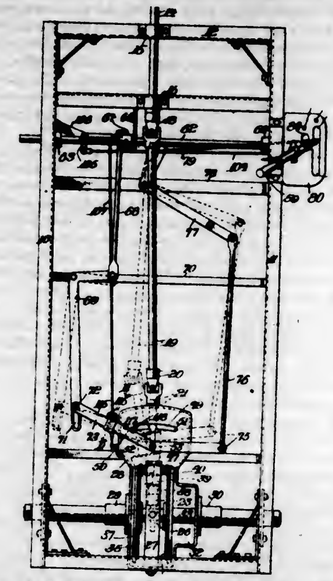
3. In a device of the class described, the combination of a reed block or box D, having reed-chambers therein; openings G for said chambers arranged toward the rear thereof; reeds suitably supported in said chambers; a face-plate for said reed-block having air delivery passages F opening into said reed-chambers; vent-passages E in said face-plate opening into said passages F; suitable means for delivering air under pressure to the said air-delivery passages of said chambers, all coacting for the purpose specified.

4. In a device of the class described, the combination of a reed block or box D having reed-chambers therein; openings G for said chambers arranged toward the rear thereof; reeds suitably supported in said chambers; a face-plate for said block having air-delivery passages F for said reed-chambers; vent-openings connected to said passages F; a bellows; an elastic storage-chamber therefor; a flexible delivery-pipe connected to said storage-chamber, having a tip adapted to be inserted into said air-delivery passages F, all coacting for the purpose specified.

5. In a device of the class described, the combination of a reed block or box D having reed-chambers therein; openings G for said chambers arranged toward the rear thereof; reeds suitably supported in said chambers; a face-plate for said reed-block having air-passages F for said reed-chambers; vent-openings connected to said passages F; an air-supply; and a flexible delivery-tube adapted to be connected to the air-delivery passages of said air-chambers, all coacting for the purpose specified.

6. In a device of the class described, the combination of a reed block or box D having reed-chambers therein; openings G for said chambers arranged toward the rear thereof; reeds suitably supported in said chambers; a face-plate for said reed-block having air-delivery passages F for said reed-chambers; vent-openings connected to said passages F; suitable means for delivering air under pressure to the said air-delivery passages of said chambers, all coacting for the purpose specified.

818,770. CHANGEABLE-SPEED GEARING. ELLIS M. BUSH, Champaign, Ill. Filed July 1, 1905. Serial No. 267,994.



Claim.—1. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized beveled pinions secured to said shaft, and means for holding said shaft with any desired one of said pinions in engagement with the wheel.

2. In a device of the class described, the combination with a pair of inwardly-facing bevel gear-wheels, of a bearing-sleeve pivoted on the axis of and between said wheels, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, and means for holding said shaft with one of said pinions in engagement with one or the other of said wheels.

3. In a device of the class described, the combination with a pair of inwardly-facing bevel gear-wheels, of a bearing-sleeve pivoted on the axis of and between said wheels, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, and means for holding said shaft with one of said pinions in engagement with one or the other of said wheels, or with any one of said pinions in engagement with the other of said wheels.

4. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, and means for holding said shaft with any desired one of said pinions in engagement with the wheel, consisting of a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, and a slotted recessed plate with which the pin coöperates.

5. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, and means for holding said shaft with any desired one of said pinions in engagement with the wheel consisting of a bearing-sleeve for the outer end of said shaft, two oppositely-extending pins carried by said bearing-sleeve, and a pair of similarly slotted and recessed plates between which the outer sleeve slides.

6. In a device of the class described, the combination with the pair of inwardly-facing bevel gear-wheels, of a bearing-sleeve pivoted between and on the axis of said wheels, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a second bearing-sleeve for the outer end of said shaft, a pair of similarly slotted and recessed plates between which the outer sleeve slides, and a pair of oppositely-extending pins secured to the outer bearing-sleeve and extending through the slots in the plates,

all combined and operating substantially as and for the purpose described.

7. In a device of the class described, the combination with the

a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of

holding said shaft with any desired one of said pinions in engage-

Claim.—1. The combination with a conduit having a two-part

all combined and operating substantially as and for the purpose described.

7. In a device of the class described, the combination with the pair of inwardly-facing bevel gear-wheels, of a bearing-sleeve pivoted between and on the axis of said wheels, a shaft journaled in said sleeve, a bevel-pinion secured to said shaft, a second bearing-sleeve for the outer end of said shaft, a pair of similarly slotted and recessed plates between which the outer sleeve slides, and a pair of oppositely-extending pins secured to the outer bearing-sleeve and extending through the slots in the plates, all combined and operating substantially as and for the purpose described.

8. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, means for holding said shaft with any desired one of said pinions in engagement with the wheel, and a lock for said means to prevent any possible disengagement of the pinions.

9. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a member moving with said outer sleeve and having a number of recesses corresponding to the pinions, a stationary bearing through which said member moves, and a locking-bolt coöperating with said recesses.

10. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pair of similarly-slotted and recessed plates between which the outer sleeve slides, oppositely-extending pins secured to said outer sleeve and extending through the slots in the plates, a pair of members moving with said sleeve and secured to the pins and having a plurality of recesses equal in number to the pinions, a pair of bearings through which said members move, and a locking-bolt sliding adjacent said bearings and coöperating with said recesses.

11. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, an inner shaft-section journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft-section, means for holding said shaft-section with any desired one of said pinions in engagement with the wheel, the outer shaft-section journaled in stationary bearings, and the intermediate shaft-section connected by universal joints to the other shaft-sections.

12. In a device of the class described, the combination with the bevel gear wheel, of a bearing-sleeve pivoted on the axis of the wheel a shaft-section journaled in said sleeve, a bevel-pinion secured to said shaft-section, means for holding said shaft-section with the pinion in or out of engagement with the wheel, an outer shaft-section journaled in stationary bearings, and an intermediate shaft-section connected by universal joints to the other two shaft-sections.

13. In a device of the class described, the combination with the pair of inwardly-facing bevel gear-wheels, of a bearing-sleeve pivoted between the wheels on the axis thereof, a shaft-section journaled in said sleeve, a bevel-pinion secured to said shaft-section, means for holding said shaft-section with the pinion in engagement with one or the other of said wheels, an outer shaft-section journaled in stationary bearings, and an intermediate shaft-section connected by universal joints to the other shaft-sections.

14. In a device of the class described, the combination with the pair of inwardly-facing bevel gear-wheels, of a bearing-sleeve pivoted between and on the axis of the wheels, a shaft-section journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shafts, means for holding said shaft-section with one of said pinions in engagement with one of said wheels, or with any one of said pinions in engagement with the other of said wheels, an outer shaft-section journaled in stationary bearings, and an intermediate shaft-section connected by universal joints to the other sections.

15. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, means for holding said shaft with any desired one of said pinions in engagement with the wheel, a shifting lever, and connections between said shaft and lever whereby any desired one of said pinions can be brought into engagement with the wheel.

16. In a device of the class described, the combination with a bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a shifting lever, and connections between said lever and pin whereby the bearing-sleeve may be shifted to bring any desired one of said pinions in engagement with the wheel.

17. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheels, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a member moving with said sleeve and having a plurality of recesses equal in number to the pinions, a stationary bearing through which said member moves, a locking-bolt coöperating with said recess, a shifting lever, and connections between said lever and bearing-sleeve whereby any desired one of said pinions may be brought in engagement with the wheel, and connections between the shifting lever and locking-bolt whereby the bolt may be operated to release the member.

18. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft-section journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft-section, means for holding said shaft-section with any desired one of said pinions in engagement with the wheel, an outer shaft-section journaled in stationary bearings, an intermediate shaft-section connected by universal joints to the other sections, a shifting lever, and connections between said lever and means whereby the pinions may be engaged and disengaged as desired.

19. In a device of the class described, the combination with the bevel gear-wheel, of the bearing-sleeve pivoted on the axis of the wheel, an inner shaft-section journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft-section, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a member moving with said sleeve and having a plurality of recesses equal in number to the pinions, a bearing through which said member moves, a locking-bolt coöperating with said recesses, an outer shaft-section journaled in stationary bearings, an intermediate shaft-section connected by universal joints to the other sections, a shifting lever, connections between said lever and bearing-sleeve for the outer end of the shaft-section whereby any desired one of said pinions may be brought in engagement with the wheel, and means adjacent the lever for moving the bolt.

20. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a shifting lever, connections between said lever and bearing-sleeve whereby any desired one of said pinions may be brought into engagement with the wheel, and a guiding-plate for said lever slotted similarly to the recessed plate with which the pin coöperates.

21. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a shifting lever, connections between said lever and bearing-sleeve whereby any desired one of said pinions may be brought into engagement with the wheel, a guiding-plate with which the lever coöperates, slotted similarly to the recessed plate with which the pin coöperates, apertures in the guiding-plate, and a spring-pressed plunger carried by the lever coöperating with said apertures.

22. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a shifting lever, connections between said lever and bearing-sleeve for bringing any desired one of said pinions into engagement with the wheel, and means for locking the lever and the bearing-sleeve each in their adjusted position.

23. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve having forked ends, pivoted bearings on the axis of said wheel through which the forks of the bearing-sleeve slide, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, and means for holding said shaft with any desired one of said pinions in engagement with the wheel.

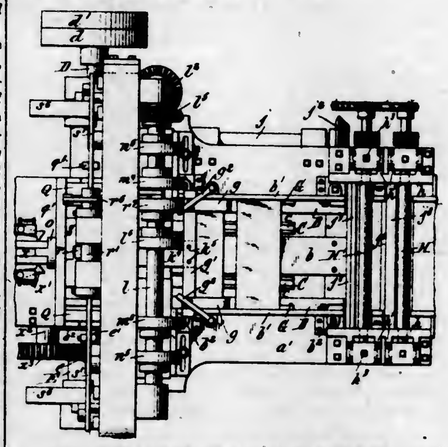
24. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a member connected with said pin, a rock-shaft a lever pivoted on said rock-shaft to swing in the plane of the axis of the rock-shaft or at an angle thereto to rock said shaft, connections between said member and rock-shaft to move the member in one plane, and connections between said member and the lever to move the member in another plane.

25. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a member connected with said pin, a rock-shaft a lever pivoted on said rock-shaft to swing in the plane of the axis of the rock-shaft or at an angle thereto to rock said shaft, connections between said member and rock-shaft to move the member in one plane, and connections between said member and the lever to move the member in another plane, said connections consisting of links and bell-cranks, substantially as shown and described.

26. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a member connected with said bearing-sleeve, a rock-shaft a lever pivoted on said rock-shaft to swing in the plane of the axis of the rock-shaft or at an angle thereto to rock said shaft, connections between said member and rock-shaft to move the member in one plane, a bell-crank pivoted between said member and lever, a link connecting the lever and one end of said bell-crank, and a link connecting the other end of said bell-crank and said member.

27. In a device of the class described, the combination with the bevel gear-wheel, of a bearing-sleeve pivoted on the axis of the wheel, a shaft journaled in said sleeve, a plurality of different-sized bevel-pinions secured to said shaft, a bearing-sleeve for the outer end of said shaft, a pin carried by said sleeve, a slotted recessed plate with which the pin coöperates, a member connected with said bearing-sleeve, a rock-shaft a lever pivoted on said rock-shaft to swing in the plane of the axis of the rock-shaft or at an angle thereto to rock said shaft, connections between said member and the lever to move the member in one plane, and connections between said member and the rock-shaft to move the member in another plane, said connections consisting of the crank-arm carried by the rock-shaft, a link pivoted to said crank-arm, a bell-crank to one arm of which the other end of said link is pivoted, and connections between the other arm of said bell-crank and said member.

818,772. MACHINE FOR MAKING CAN-BODIES. WILLIAM CANNON, Chicago, Ill., assignor to Torris Weld, Chicago, Ill. Filed May 22, 1905. Serial No. 261,310.



Claim.—1. The combination of an edging mechanism, a reciprocating conveyer for carrying the blanks to the edging mechanism, a feed mechanism comprising a movable gage, a cutter for dividing a sheet into blanks, feed-rolls for moving the sheet to the cutter, and feed-rolls for moving the blanks from the cutter to the reciprocating conveyer, substantially as set forth.

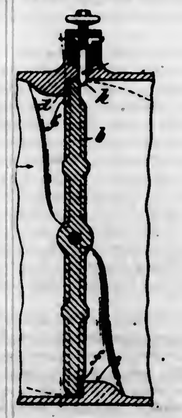
2. The combination of edging mechanism, a reciprocating conveyer for carrying the blanks to the edging mechanism, and a feed mechanism comprising a reciprocating gage, a reciprocating cutter for dividing a sheet into blanks, rolls for feeding the sheet to the cutter and gage, and rolls for moving the blanks to said reciprocating conveyer, substantially as set forth.

3. The combination of edging mechanism, a reciprocating conveyer for carrying the blanks to the edging mechanism, and a feed mechanism comprising a gage, a cutter for dividing a sheet into blanks, means for oppositely reciprocating said gage and cutter, a yielding roll frictionally engaging the sheet for feeding the same to the cutter and gage, and a yielding roll frictionally engaging the blanks for moving the same to said reciprocating conveyer, substantially as set forth.

4. The combination of a blank-support, an edging mechanism, a reciprocating blank-conveyer, means to engage the blanks to hold them from rearward movement, a cross-bar arranged above said conveyer, yielding fingers which are secured to said cross-bar and bear on the blanks to hold the latter down on said support and from movement in advance of the conveyer-dogs, and a weight loosely retained in position by said cross-bar for holding the blank in the edging mechanism, substantially as set forth.

5. The combination of an expansible forming-horn around which the body is formed, a horn-expanding device, and fingers for moving the body off of said forming-horn, said fingers being connected to and movable with said expanding device, substantially as set forth.

818,771. WICKET-VALVE. JAMES F. DUDE, Springfield, Mass. Filed July 1, 1904. Serial No. 215,042.



Claim.—1. The combination with a conduit having a two-part flange on the inner wall thereof located partly on one side and partly on the other side of a plane vertical to the axis of the conduit, and constituting an abutment for the edges of the opposites of the valve, a wicket-valve pivotally supported at opposite points thereon substantially in the plane of said flanges, and a screw-operated shaft having a tapered point extending through the wall of the conduit to bear against the back side of the valve to force the latter to a seat against said flanges.

2. The combination with a conduit having a two-part flange on the inner wall thereof located partly on one side and partly on the other side of a plane vertical to the axis of the conduit, and constituting an abutment for the edges of the opposites of the valve, a wicket-valve pivotally supported at opposite points thereon substantially in the plane of said flanges, a screw-operated shaft having a tapered point extending through the wall of the conduit to bear against the back side of the valve to force the latter to a seat against said flanges, and a packing-gland for said shaft.

ed to and movable with said expanding device, substantially as set forth.

6. The combination of an expansible forming-horn around which the body is formed, a reciprocating horn-expanding device, fingers connected to said expanding device for moving the body off of said forming-horn, said expanding device acting to expand the horn when said device is moved in one direction and said fingers acting to move the body when said device is moved in the opposite direction, substantially as set forth.

7. The combination of an expansible forming-horn around which the body is formed, a horn-expanding device, fingers connected to move with said expanding device to move the body off of said forming-horn, and a single device for operating said expanding device and fingers, substantially as set forth.

8. The combination of an expansible forming-horn around which the hooked body-blank is shaped, a device for expanding the horn to interlock the seam-hooks, fingers which move the body longitudinally along said horn, a movable support for a seam-closing hammer, means for operating said hammer-support, and operating means for said horn-expanding device and blank-moving fingers actuated by said hammer-support, substantially as set forth.

9. The combination of an expansible forming-horn around which the body is formed, a longitudinally-movable expanding-pin, longitudinally-arranged fingers which engage the body and move the same off of said forming-horn, a slide-head on which said expanding-pin and fingers are mounted, and means for reciprocating said slide-head, substantially as set forth.

10. The combination of an expansible forming-horn around which the body is formed, a longitudinally-movable expanding-pin, longitudinally-arranged fingers which work in grooves in said horn, means for spreading said fingers to engage the can-body to move the same off of the forming-horn, a slide-head on which said expanding-pin and fingers are mounted, and means for reciprocating said head, substantially as set forth.

11. The combination of a frame, an expansible forming-horn around which the body is formed, a reciprocating conveyer for moving the blank to said forming-horn, fingers for engaging the body to move the same off of said forming-horn, a slide carrying said fingers, said slide working in ways formed by said frame and said reciprocating conveyer, substantially as set forth.

12. The combination of a frame, a forming-horn around which the body is formed, reciprocating feed-bars for moving the blank to said horn, slides carrying said feed-bars, guides in said frame in which said slides work, fingers which engage the body to move the same off of the forming-horn, and a slide-head carrying said fingers, said slide-head working in ways formed by said frame and the slides for said reciprocating feed-bars, substantially as set forth.

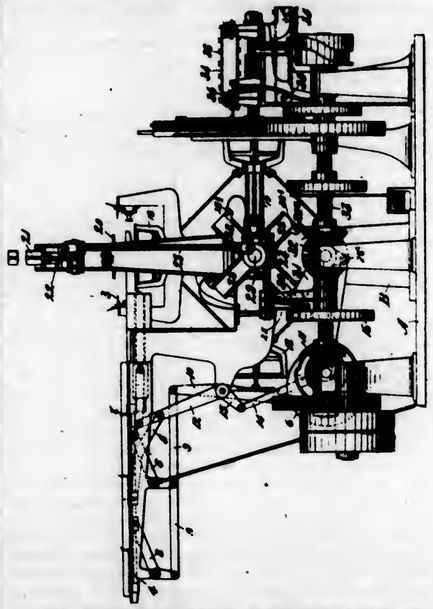
13. The combination of a frame, an expansible forming-horn around which the body is formed, reciprocating feed-bars for moving the blank to said forming-horn, slides for said feed-bars which reciprocate on said frame, an expanding device, fingers which engage the body to move the same off of said forming-horn, a slide-head on which said expanding device and fingers are mounted, said slide-head working in ways formed by said frame and said slides for the reciprocating feed-bars, substantially as set forth.

14. The combination of body-forming mechanism, a drive-shaft, a clutch device for coupling said drive-shaft with said forming mechanism, and an operating device for the conveyer of the soldering mechanism which is driven by said drive-shaft, whereby said body-forming mechanism can be stopped without stopping said operating device for the conveyer of the soldering mechanism, substantially as set forth.

15. The combination of a body-forming mechanism, a drive-shaft, gearing connecting said drive-shaft and body-forming mechanism including a loose gear-wheel, a clutch device for operatively connecting said loose gear-wheel to said drive-shaft and gearing connecting said drive-shaft to the conveyer of the soldering mechanism, whereby said body-forming mechanism can be stopped while said conveyer for the soldering mechanism continues in motion, substantially as set forth.

818,778. AUTOMATIC BASKET-MACHINE. SECUNDO L. CASSERA, San Francisco, Cal., assignor of three-fourths to W. F. Burnes Commercial Company, San Francisco, Cal., a Corporation, and one-fourth to D. F. Kimball, San Francisco, Cal. Filed Jan. 6, 1905. Serial No. 239,991.

Claim.—1. A basket-forming machine consisting of mechanism by which sheets of veneer are picked transversely across each other, mechanism by which said sheets are folded to form the bottom and four sides, mechanism by which folded strips of sheet metal are placed contiguous to two opposite edges of the basket, mechanism by which said strips are bent to form angles and the other two sides and overlap at their junction, mechanism by which the overlapping ends of the strips are nested together and the strips placed upon the edges of the basket, and mechanism by which said strips are simultaneously crimped and locked upon the edge of the basket and to each other.



2. In a basket-making machine, tables standing at right angles and intersecting at a common center, carriers movable upon said tables and adapted to advance veneer sheets by intermittent movements, a form upon which said sheets are placed transversely, a plunger by which the sheets are forced into the form and the sides upturned and pins upon which the bottom of the sheets are impaled to lock them together.

3. In a basket-making machine, tables standing at right angles and intersecting at their inner ends, and carriers by which veneers are intermittently moved upon the tables to the point of intersection, a revoluble shaft with arms, formers carried at the ends of said arms, means for intermittently rotating the shaft and formers, means for placing two of the veneers transversely upon each former when it arrives at the plane of travel of the veneers, a plunger and means for reciprocating said plunger to fold each pair of veneers and form sides therefor, and pins adapted to pierce and secure the bottoms of the baskets.

4. In a machine for making baskets, tables intersecting each other at right angles, carriers movable upon said tables and adapted to receive veneers and carry them by intermittent movements to the point of intersection, a revoluble shaft with radial arms and rectangular forms carried at the outer ends of said arms, means for revolving said shaft and arms a quarter of a revolution at each movement, a plunger reciprocating in line with the formers after the veneers have been placed thereon whereby the edges of the veneers are turned up to form sides, carriers movable at right angles with said plunger adapted to receive folded strips of metal, mechanism by which said strips are bent to form angles and to overlap each other on two opposite sides, mechanism by which said strips are advanced and forced upon the edges of the basket, and mechanism by which the strips are crimped and interlocked with each other and the basket edges.

5. In a machine for making baskets, mechanism by which two veneers are placed transversely to each other and the sides upturned, mechanism by which the baskets are advanced and the former turned a quarter of a revolution, endless chains having notches adapted to receive folded strips of sheet metal and advance them toward the outwardly-presented edges of the basket, mechanism by which the strips are bent to form corners intermediate of the upturned sides, mechanism by which the strips are advanced, fitted upon the basket edges and crimped thereon.

6. In a basket-making machine, means for presenting and holding rectangularly-bent veneer, carriers by which folded strips of sheet metal are delivered parallel with two opposite edges of the basket, and folders by which the projecting ends of the strips are gripped and bent to register with the other edges of the basket and to overlap centrally of the sides.

7. In a basket-making machine, means for presenting and holding rectangularly-bent veneers, carriers by which folded strips of sheet metal are delivered and registered with two opposite edges of the basket, folders by which the projecting ends of said strips are gripped and bent to register with the other edges of the basket and to overlap centrally of the sides, and mechanism by which the strips are advanced to fit the edges of the basket.

8. In a basket-making machine, means for presenting and holding rectangularly-bent veneers, carriers by which folded strips of sheet metal are delivered to register with two opposite edges of the basket, folders by which the strips are gripped and bent to form corners and to register with the remaining basket edges and to overlap centrally of the sides, means by which the strips are advanced to fit the edges of the basket, and mechanism by which they are crimped upon said edges.

9. In a basket-making machine, mechanism for presenting and holding rectangularly-bent veneers, means for delivering folded sheet-metal strips to register with two opposite edges of the basket and folding devices by which the strips are gripped and bent to register with the other edges of the basket and to overlap centrally of said sides.

10. In a basket-making machine, mechanism by which rectangularly-bent veneers are presented and held, carriers by which folded sheet-metal strips are brought to register with two opposite edges of the basket, folders by which the strips are gripped and bent to overlap and register with the remaining sides, mechanism by which the strips are forced upon the edges of the basket, and oppositely-movable jaws between which the strips are compressed to form a rim for the basket.

11. In a basket-making machine, a means for securing metallic strips upon the edges of veneer baskets, said means comprising independent exterior and interior jaws corresponding with the sides of the basket, and mechanism by which said jaws are simultaneously advanced in planes one at right angles to the other to crimp the metal strips.

12. In a basket-making machine, means for securing folded metallic strips upon the edges of veneer baskets, said means comprising guided exterior and interior jaws between which the basket sides lie, and cams by which the jaws are simultaneously advanced in planes one at right angles to the other to crimp the strips upon the inclosed basket edges.

13. In a basket-making machine, mechanism by which sheets of veneer are assembled and bent to form upturned sides, mechanism to apply and crimp binding-strips upon the basket edges, an ejector for the finished basket, a carrier consisting of arms radiating from a central shaft, and mechanism by which said carrier is intermittently advanced and locked for each step of the operation.

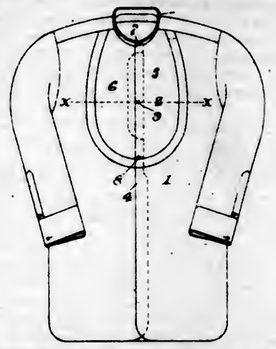
14. In a basket-making machine, a revoluble former comprising frames upon which veneers are placed and mechanism by which it is intermittently advanced, means for placing two of the veneers transversely upon each former, a reciprocating plunger by which said veneers are bent and sides formed, and a spring-pressed slide by which the veneers are held in place until the plunger acts.

15. In a basket-making machine, a revoluble former comprising frames upon which veneers are placed, and a reciprocating plunger by which the veneers are bent into basket form within the frames, plates within the frames, and cam-actuated means for advancing the plates to eject the finished product.

16. In a basket-making machine, a revoluble former, comprising frames upon which veneers are placed, a reciprocating plunger by which the veneers are bent into basket form within the frames, plates within the frames and slidably-guided rods connected to the plates, a cam by which the plates are retained in the former during a portion of its revolution, and springs by which the plates are moved out when released by the cam and the finished product ejected.

818,774. SHIRT. ABBE F. CHASE, Lynn, Mass. Filed Sept. 1, 1905. Serial No. 277,676.

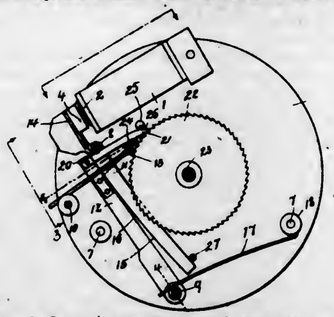
Claim.—1. A shirt provided with a bosom composed of overlapping and underlying sections, the overlapping section being provided along its edge with a flap folded back beneath the edge of the overlapping section and thence folded forward upon itself forming a pocket to receive the edge of the underlying section, substantially as described.



2. A shirt provided with a bosom comprising overlapping and underlying sections, the overlapping section being provided with an interfolding flap, the said flap united to the edge of the overlapping section of the bosom by a weakened folding joint and provided with an intermediate weakened folding joint, substantially as described.

3. A shirt provided with a bosom comprising overlapping and underlying sections, the overlapping section provided with an interfolding flap arranged to receive the edge of the underlying section, said flap provided with a tab, said tab engaging a button, substantially as described.

818,775. ELECTROMAGNETIC MOTOR. MURRAY CHENEVER, Boston, Mass., assignor to The E. Howard Clock Company, Boston, Mass., a Corporation of Maine. Filed Feb. 20, 1905. Serial No. 246,433.



Claim.—1. In a magnetic motor, an electromagnet, an armature arranged to be moved by the attraction of the magnet, a lever connected to the armature, a member arranged for engagement and operation by said lever, said lever and member being so constructed and arranged that as the armature is moved and the force of the magnetic attraction upon it is varied, the amount of motion imparted to the said member by the lever is varied in proportion, and mechanism having connection with said member so as to be driven thereby with a step-by-step movement.

2. In a magnetic motor, an electromagnet, a lever, an armature for the magnet carried by said lever and adapted to be moved by the attraction of the magnet, a movable member adapted to be moved by said lever, the said lever and member being constructed and arranged so that the force of said lever is applied to said member at points at varying distances from the pivot of the lever as the distance between the magnet and armature is varied, mechanism movable step by step, and driving connections between said member and mechanism for intermittently operating the latter.

3. In a magnetic motor, an electromagnet, a lever, an armature for the magnet carried by said lever and adapted to be moved by the attraction of the magnet, driven mechanism movable step by step, a second lever, and intermittently-acting connections with said lever adapted to operate said mechanism, the said levers being arranged

to engage each other, and one of said levers being curved at its engaging surface to cause the point of engagement to shift as the armature is moved relatively to the magnet and the armature-carrying lever moved thereby.

818,776. AUTOMOBILE. ALEXANDER CONSTANTINESCO, Paris, France. Filed Aug. 19, 1905. Serial No. 274,722.

Claim.—1. In an automobile, the combination with the body, of a fender, a rotating shaft mounted in the rear of said body, a cable connected with said rotating shaft, and the lower end of the fender, a rotating shaft mounted in the rear of said casings, a cable connected with said rotating shaft, and the lower end of the casings and engaging the rear ends of the same, and the lower end of said fender, a rotating shaft mounted in the rear of said casings, a cable connected with said rotating shaft, and the lower end of the

frame on the carriage constituting, with a portion of the latter, a paper-clamp, and means operated by the movements of the machine to actuate said frame at the limit of the movement of the carriage in either direction.

7. In a printing-press, a reciprocating type-carriage, a bed therefor, an oscillatory roll-frame pivoted to said support having an inking-roll and an impression-roll located at opposite sides of the

to engage each other, and one of said levers being curved at its engaging surface to cause the point of engagement to shift as the armature is moved relatively to the magnet and the armature-carrying lever moved thereby.

6. In a magnetic motor, an electromagnet, a rotary driven member, a movable armature for the magnet, a lever having a reciprocating connection arranged for rotating said driven member, and a second lever connected to the armature, and arranged to engage and move said first lever, said levers being constructed and arranged so that as one is moved its point of engagement with the other is caused to shift so as to increase the amount of movement imparted to the other lever proportionately to the variations in the amount of the attraction of the magnet on the armature due to the varying distances between the magnet and armature.

5. In a magnetic motor, an electromagnet, a lever, an armature for the magnet carried by said lever and adapted to be moved by the attraction of the magnet, a rotary shaft, and a second lever having reciprocatory connections arranged to communicate rotary movement to said shaft, and being engaged with said first lever, the said first lever having its engaging side longitudinally curved so that as it is moved its point of engagement with the second lever is shifted to varying distances from its pivot to cause the force received therefrom by the second lever to vary inversely to the force of the magnetic attraction acting on the armature.

6. In a magnetic motor, an electromagnet, a lever, an armature for the magnet carried by said lever and adapted to be moved by the attraction of the magnet, a shaft, a ratchet mounted on the shaft, a second lever, and a pawl carried thereby and arranged to engage said ratchet, the second lever being engaged and operated by the first lever, and said levers being so constructed and arranged that they are caused to engage at points varying in distance from their pivots as the first lever is moved and the distance between the armature and magnet varied.

7. In a magnetic motor, an electromagnet, a lever, an armature for the magnet carried by said lever and adapted to be moved by the attraction of the magnet, a shaft, a ratchet mounted on the shaft, a second lever mounted for engagement and operation by the first-named lever, a pawl carried by said second lever and arranged to engage said ratchet intermittently, and a stationary pawl arranged to engage and hold the ratchet while the lever-carried pawl is out of engagement therewith.

8. In a magnetic motor, an electromagnet, a lever, an armature for the magnet carried by said lever and adapted to be moved by the attraction of the magnet, a shaft, a ratchet mounted on the shaft, a second lever mounted for engagement and operation by the first-named lever, a pawl carried by said second lever and arranged to engage said ratchet intermittently, a stationary pawl arranged to engage and hold the ratchet while the lever-carried pawl is out of engagement therewith, and means for engaging said pawls alternately.

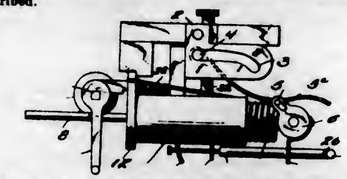
9. In a magnetic motor, an electromagnet, a lever, an armature for the magnet carried by said lever and adapted to be moved by the attraction of the magnet, a shaft, a ratchet mounted on the shaft, a second lever mounted for engagement and operation by the first-named lever, a pawl carried by said second lever and arranged to engage said ratchet intermittently, and means located in the path of movement of said pawl arranged to be engaged by said pawl and to force and hold the same in positive engagement with the teeth of the ratchet when the pawl is projected.

10. In a magnetic motor, an electromagnet, a lever, an armature for the magnet carried by said lever and adapted to be moved by the attraction of the magnet, a shaft, a ratchet mounted on the shaft, a second lever mounted for engagement and operation by the first-named lever, a pawl carried by said second lever and arranged to engage said ratchet intermittently, a stationary pawl arranged to engage and hold the ratchet while the lever-carried pawl is out of engagement therewith, a device adapted to engage the lever-carried pawl to hold the same in engagement with the teeth of the ratchet when the pawl is projected, and a member rigidly supported on one of the levers and adapted to engage and hold the stationary pawl in engagement with the teeth of the ratchet.

813,776. **FENDER.** ANDREW CHUVAN and MICHAEL GEE, Allegheny, Pa. Filed Aug. 21, 1905. Serial No. 275,026.

Claim.—1. The combination of a fender having its upper and lower ends mounted in longitudinally-slotted supports, and means for reciprocating said fender, substantially as described.

2. In a device of the class described, the combination of a fender, a pair of horizontal bars engaging the lower end of said fender, hollow cylindrical casings housing said bars, springs mounted in said casings and engaging the rear ends of the same, and the lower end of said fender, a rotating shaft mounted in the rear of said casings, a cable connected with said rotating shaft, and the lower end of the said fender, a spring-actuated dog adapted to engage a notch on said rotating shaft, and means for releasing said dog, substantially as described.

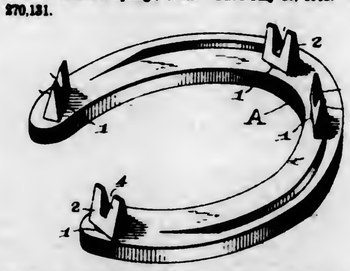


3. In a device of the class described, the combination of a fender, horizontal bars mounted in a pair of hollow cylindrical casings, and supporting the lower end of said fender, springs mounted in said casings and engaging the rear end of same, and the fender, a rotating shaft mounted in the rear of said casings and provided with a notched flange, a cable connected with said shaft and the fender, a dog adapted to engage said notched flange, a trigger adapted to release said dog, a trip-bar adapted to engage said trigger, substantially as described.

4. In a device of the class described, the combination of a fender mounted on suitable supports, a rotating shaft mounted in the rear of said fender, a flange having a notch, said flange being formed integral with said shaft, a cable connected with said rotating shaft and the fender, a dog adapted to engage said notch, trigger mechanism adapted to release said dog, means adapted to be engaged by the motorman for operating the trigger, and springs adapted to thrust the fender forward, substantially as described.

5. A fender having a rotating shaft provided with a notch, a dog adapted to engage said notch, a cable having one end secured to said shaft, and the other end secured to said fender, and means for thrusting said fender forward, substantially as described.

813,777. **HORSESHOE-CALK.** WILLIAM A. COMINS and JOSEPH CONNOR, Stafford Springs, Conn. Filed July 17, 1905. Serial No. 270,131.

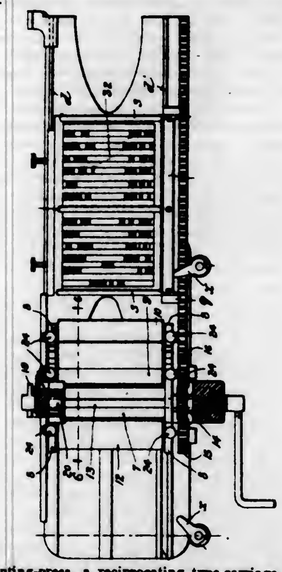


Claim.—A horseshoe-calk having a hard-metal core and a soft-metal exterior, said calk being bifurcated substantially midway of its ends, and the core being exposed in the bifurcation.

813,778. **PRINTING-PRESS.** ELISHA M. COGGIN, Hartford, Conn., assignor to Whitney Manufacturing Company, Hartford, Conn., a Corporation. Filed Oct. 2, 1905. Serial No. 280,260.

Claim.—1. In a printing-press a reciprocating type-carriage and a suitable bed therefor, a flier-frame having arms to receive the paper, said frame being pivotally supported on the carriage and constituting with a part of the latter a clamp for the paper, means operative near the end of the movement of the carriage in either direction to actuate the flier-frame to release the paper, and an ink-roll and impression-roll supported above the type-carriage, together with means operated by the movements of the carriage to alternately bring said rolls into operative relation to the type on the carriage.

2. In a printing-press, a reciprocating type-carriage, a bed therefor, an oscillatory roll-frame pivoted to said support having an inking-roll and an impression-roll located at opposite sides of the center of oscillation of the roll-frame, means operated by the movements of the carriage to tilt the frame to bring said rolls alternately into operative relation to the type, and a device to lock the roll-frame against oscillation when tilted in one direction, together with a flier-frame on the carriage constituting, with a portion of the latter, a paper-clamp, and means operated by the movements of the machine to actuate said frame at the limit of the movement of the carriage in either direction.



3. In a printing-press, a reciprocating type-carriage, a bed therefor, an oscillatory roll-frame pivoted to said support having an inking-roll and an impression-roll located at opposite sides of the center of oscillation of the roll-frame, means operated by the movements of the carriage to tilt the frame to bring said rolls alternately into operative relation to the type, and a device to lock the roll-frame against oscillation when tilted in one direction, together with a movable guard for the ink-roll actuated by the movements of the roll-frame to swing under the inking-roll when the impression-roll is in operative position, and vice versa.

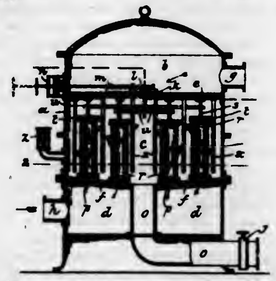
4. In a printing-press, a reciprocating type-carriage, and a suitable bed therefor, said carriage having ribs extending longitudinally thereof between which the type may be secured, a flier-frame pivotally supported on one of said ribs and having arms thereon extending toward the opposite rib, and means operable near the limit of movement of the carriage in either direction to swing the flier-frame toward and from said rib to clamp or release the paper, in combination with an inking-roll and an impression-roll supported above the type-carriage, and actuated by the movements of the latter to bring them alternately into operative relation to the type on the carriage.

5. In a printing-press, a reciprocating type-carriage, and a suitable bed therefor, said carriage having ribs extending longitudinally thereof between which the type may be secured, a flier-frame pivotally supported on one of said ribs and having arms thereon extending toward the opposite rib, said flier-frame having projections thereon extending below the pivotal point of the latter, a finger rotatable on a vertical axis supported on the bed in position to contact with one of said projections on the flier-frame near the limit of movement of the latter in either direction, whereby the flier-frame will be oscillated in its bearings to release the paper at the proper time.

6. In a printing-press, a suitable bed having an overhanging arm, a type-carriage on the bed movable reciprocally under said arm, an oscillatory roll-frame supported on said arm, comprising a trough-shaped central portion and rectangularly-disposed end portions, an ink-roll and an impression-roll being supported in the latter on either side of the center of oscillation of the frame; a shaft extending through the end of the overhanging arm, and a short arm depending from opposite ends of the shaft, the inner arm being arranged to engage the roll-frame, the outer arm being actuated by contact with a projection on the bed whereby near the limit of movement of the carriage in one direction the roll-frame may be tilted to bring the ink-roll or the impression-roll into operative relation with the type on the carriage, together with means to adjust the ink-roll and impression-roll in their bearings.

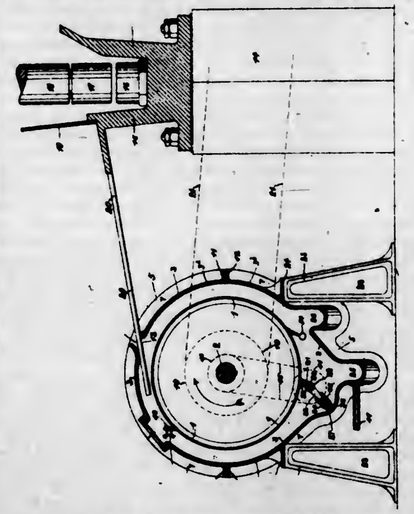
7. In a printing-press, a reciprocating type-carriage, a bed therefor, an oscillatory roll-frame pivoted to said support having an inking-roll and an impression-roll located at opposite sides of the center of oscillation of the roll-frame, means operated by the movements of the carriage to tilt the frame to bring said rolls alternately into operative relation to the type, together with a guard for the ink-roll supported to swing on the axis of the latter, a forked member rigidly supported in proximity to the end of said roll, said guard having a pin therein to engage said fixed fork whereby the oscillatory movements of the roll will effect the swinging of said guard in and out under the roll.

813,779. **MEANS FOR FILTERING OR PURIFYING WATER.** WILLIAM COWERN, Hawera, New Zealand. Filed Apr. 29, 1905. Serial No. 257,966.



Claim.—In water-purifiers, a casing divided into three chambers by horizontal divisional plates, an inlet leading to the top chamber, an outlet leading from the bottom chamber, an aperture in the top divisional plate, a slide-valve adapted to cover and uncover such aperture and a pipe, controlled by a valve leading from the bottom of the middle chamber to outside the casing, in combination with a number of hollow pillars of porous stone arranged vertically within the middle chamber, apertures formed in the lower divisional plate, over each one of which a hollow pillar rests, and a number of perforated pipes opening from the top chamber and extending downward through the middle chamber interspersed with the hollow pillars, substantially as specified.

813,780. **AMALGAMATOR.** DAVID DRAPER and GEORGE A. HAY, Johannesburg, Transvaal. Filed Mar. 15, 1905. Serial No. 250,268.



Claim.—1. An amalgamating-machine comprising a revolvable drum the periphery of which is made the amalgamated surface, a casing surrounding said drum, means for rotating the drum, means

for introducing the pulp or gold-bearing material into the casing and delivering it onto the amalgamated surface of the drum, a scraper lo-

8. In an amalgamating-machine the combination of a drum, means for rotating said drum, a casing inclosing said drum, said ca-

to the interior thereof, of a pair of frame-arms and their color-glasses, a two-part revolvable support therefor and separate and independent

smaller opening other than circular and adapted to receive a portion of said shaft having a corresponding surface configuration, and each

for introducing the pulp or gold-bearing material into the casing and delivering it onto the amalgamated surface of the drum, a scraper located in the casing and adapted to be brought into contact with the amalgamated surface to remove the amalgam, and means for traversing said scraper longitudinally of the drum.

2. An amalgamating-machine comprising a drum, the periphery of which is made the amalgamated surface, a casing completely inclosing said drum, means for rotating the drum, means for conducting the pulp into the casing and delivering it onto the amalgamated surface in a direction opposite to that of rotation of the drum, a scraper arranged in the casing and adapted to be brought into contact with the amalgamated surface to remove the amalgam, and means for traversing said scraper longitudinally of the drum.

3. An amalgamating-machine comprising a drum the periphery of which forms or is made the amalgamated surface, a casing inclosing said drum said casing being formed with a longitudinal slot forming an inlet and with a recess or sump to receive the amalgam when it is removed from the surface of the drum, an inclined plate or tray for conducting the pulp into the casing and delivering it onto the surface of the drum in a direction opposite to that of rotation of said drum, a scraper located in the casing above the recess formed in the latter, said scraper being adapted to be brought into contact with the amalgamated surface to remove the amalgam, and means for traversing said scraper longitudinally of the drum in either direction.

4. An amalgamating-machine comprising a drum the periphery of which is made the amalgamated surface, a casing completely inclosing said drum, said casing being constructed with a longitudinal inlet or slot above the drum, and with a recess or sump in the bottom to receive the concentrates removed from the surface of the drum, and with another sump or recess to receive the amalgam when it is removed from the surface of the drum, a revoluble brush arranged longitudinally of the casing for cleaning the amalgamated surface of the drum, means for rotating said brush, a scraper journaled longitudinally of the drum and adapted to be brought into contact with the amdlgamated surface, means for traversing said scraper longitudinally of the drum in either direction, and a water-spray pipe located beneath the drum for washing the concentrates off the amalgamated surface of the drum.

5. An amalgamating-machine comprising a drum, the periphery of which is made the amalgamated surface, a casing inclosing the drum said casing being constructed with a longitudinal slot forming an inlet above the drum, and with a longitudinal slot through which the amalgamated surface of the drum may be inspected, and with a recess or sump in the bottom of the casing adapted to receive the amalgam when it is removed from the surface of the drum and with a recess or sump adapted to receive the concentrates, means for removing the amalgam from the surface of the drum said means being adapted to be traversed longitudinally of the drum, means for removing the concentrates from the surface of the drum, means for conducting the material carrying the gold through the inlet in the casing and delivering it in a direction opposite to that of rotation of the drum, and an outlet in proximity to the bottom of the casing for carrying away the waste from said casing.

6. An amalgamating-machine comprising a drum the periphery of which is made the amalgamated surface, a casing surrounding said drum said casing being constructed with a longitudinal slot forming the inlet for the material containing the gold and with a longitudinal slot through which the amalgamated surface may be inspected and with two inclined recesses or sumps for receiving, the one the amalgam and the other the concentrates, means for conducting the gold-containing material through the inlet and delivering it onto the drum in a direction opposite to that of rotation of the latter, a brush for cleaning the amalgamated surface, means for rotating said brush, a scraper located in the casing for removing the amalgam from the surface of the drum and means for traversing said scraper longitudinally of the drum in either direction, means for removing the concentrates from the surface of the drum and means for conducting the waste from the casing.

7. In an amalgamating-machine, in combination, a drum the periphery of which is made the amalgamated surface, a casing inclosing said drum said casing being constructed with an inlet and with an inclined sump or recess, means for rotating said drum inside said casing, means for conducting the gold-bearing material into the casing in a direction opposite to that of rotation of the drum, a screw journaled in the ends of the casing and arranged parallel with the axis of the drum, a nut mounted on said screw, a scraper carried by said nut adapted to be brought into contact with the amalgamated surface to remove the amalgam, and means for reversing the direction of rotation of said screw to traverse the scraper longitudinally of the drum in either direction.

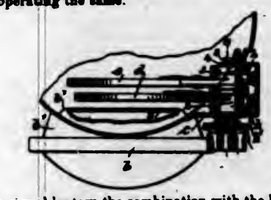
8. In an amalgamating-machine the combination of a drum, means for rotating said drum, a casing inclosing said drum, said casing being constructed with a longitudinal slot forming an inlet above the drum, and with an inclined recess or sump below the drum, an inclined plate or tray projected through the slot for conducting the gold-containing material into the casing and delivering it in a direction opposite to that of rotation of the drum, a screw journaled in the ends of the casing and arranged parallel with the axis of the drum, means for imparting rotary motion to said screw in either direction, a nut mounted on said screw, a scraper carried by said nut adapted to be brought into contact with the amalgamated surface, an arm or projection on said nut, a bar arranged parallel with the screw formed with a slot into which said arm projects, and means for operating said bar to throw the scraper into or out of contact with said amalgamated surface, substantially as described.

9. In an amalgamating-machine the combination of a drum fixed to a driving-shaft, a casing surrounding said drum the ends of which casing provide bearings for the driving-shaft of the drum said casing being constructed with a slot parallel with the axis of the drum and with a longitudinal slot for permitting inspection of the amalgamated surface and with two inclined sumps or recesses in the bottom, an inclined plate or tray for conducting the gold-bearing material through the inlet and delivering it onto the drum in a direction opposite to that of rotation of the latter, a brush arranged parallel with the amalgamated surface for cleaning said surface, means for driving said brush from the main driving-shaft, a screw journaled in the ends of the casing and arranged parallel with the axis of the drum, a nut on said screw formed with two arms or projections, a scraper fitted to one of said arms or projections adapted to be brought into contact with the amalgamated surface of the drum, a bar pivoted in the ends of the casing and arranged parallel with the screw and formed with a longitudinal groove into which the other arm of the nut projects, means attached to said bar outside the casing for throwing the scraper into or out of contact with the amalgamated surface and retaining it in those positions, a pipe communicating with the casing at the bottom for carrying away the waste, and a water-spray pipe for washing the concentrates off the amalgamated surface into the concentrate-sump, substantially as described.

10. An amalgamating-machine comprising in combination, a drum the periphery of which is made the amalgamated surface, a shaft to which said drum is fixed, a pulley on said driving-shaft for imparting rotary motion to the drum, a casing constructed in two parts longitudinally and formed with longitudinal ribs or flanges through which they are connected, said casing being formed with a longitudinal slot forming a inlet and with a longitudinal slot closed by means of glass for permitting inspection of the amalgamated surface and with two inclined recesses or sumps at the bottom, the ends of said casing forming bearings for the driving-shaft of the drum, standards for carrying said casing, an inclined plate for conducting the gold-bearing material through the inlet in the casing and delivering it onto the drum in a direction opposite to that of rotation of the latter, a brush journaled in the ends of the casing in contact with the amalgamated surface for cleaning the latter, a pulley fixed on the spindle of the brush outside the casing, a pulley on the main shaft and a belt for transmitting motion through said pulleys from the main shaft to the brush, a screw journaled in the ends of the casing parallel with the axis of the drum, fast and loose pulleys on each end of said screw outside the casing, a nut mounted on the screw formed with two arms or projections, a scraper fixed to one of said arms adapted to be brought into contact with the amalgamated surface of the drum, a bar pivoted in the ends of the casing formed with a longitudinal groove or recess into which the other arm of the nut projects, a lever and weight on the end of said bar outside the casing for rotating said bar in either direction to move the scraper into or out of contact with the amalgamated surface of the drum, fast and loose pulleys on the main driving-shaft at either end of the casing in line with the fast and loose pulleys on the end of the screw, a straight belt and a crossed belt on said pulleys adapted to rotate said screw in either direction from the main driving-shaft or to allow said screw to remain stationary, a water-spray pipe located below the drum for washing the concentrates into the concentrate-sump, and a pipe for carrying away the waste from the casing, substantially as described.

818,781. **SIGNAL-LANTERN.** CHARLES H. DIETERICH, New York, N. Y., assignor to The Dressel Railway Lamp Works, New York, N. Y., a Corporation of New York. Filed Sept. 30, 1905. Serial No. 280,943.

Claim.—1. In a signal-lantern, the combination with the body and lens-glass and a box-casing built on the side of the body and open to the interior thereof, of a pair of frame-arms and their color-glasses, a two-part revoluble support therefor and separate and independent means for operating the same.



2. In a signal-lantern the combination with the body and lens-glass and a box-casing built on the side of the body and open to the interior thereof, of a pair of frame-arms and their color-glasses, a two-part revoluble support therefor, separate and independent means for operating the same, and similar separate means for maintaining the said frame-arms in their operative and inoperative positions.

3. In a signal-lantern, the combination with the body and lens-glass and the box-casing built on the side of the body and open to the interior thereof, of a pair of frame-arms and their color-glasses, a sleeve connected to one frame-arm and passing through the casing, a shaft passing through said sleeve and through the other frame-arm and having a bearing in the body of the lantern, and means for independently actuating the said frame-arms, and other means for maintaining them in their operative and inoperative positions.

4. In a signal-lantern, the combination with the body and lens-glass and the box-casing built on the side of the body and open to the interior thereof, of a pair of frame-arms and their color-glasses, a sleeve connected to one frame-arm and passing through the casing, a shaft passing through said sleeve and through the other frame-arm and having a bearing in the body of the lantern, a knurled disk on said sleeve outside the casing for turning the same and the color-glass connected therewith, a thumb-piece on the shaft outside the casing and beyond said knurled disk for turning the same and the frame-arm connected with said shaft, and means for maintaining said frame-arms in their operative and inoperative positions

5. In a signal-lantern, the combination with the body and the lens-glass and the casing built on the side of the body and open to the interior thereof, of a pair of frame-arms and their color-glasses, a sleeve connected to one frame-arm and passing through the casing, a shaft passing through said sleeve and through the other frame-arm and having a bearing in the body of the lantern, a knurled disk on said sleeve outside the casing for turning the same and the color-glass connected therewith, a thumb-piece on the shaft outside the casing and beyond said knurled disk for turning the same and the frame-arm connected with said shaft, and means for maintaining said frame-arms in their operative or inoperative positions.

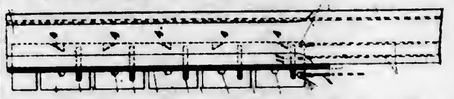
6. In a signal-lantern, the combination with the body and lens-glass, of a pair of frame-arms and their color-glasses, a sleeve connected to one frame-arm and a bearing-support therefor, a shaft passing through said sleeve and through the other frame-arm and having a bearing in the body of the lantern, a knurled disk on said sleeve outside the casing for turning the same and the color-glass connected therewith, a thumb-piece on the shaft outside the casing and beyond said knurled disk for turning the same and the frame-arm connected with said shaft, and means for maintaining said frame-arms in their operative and inoperative positions.

7. In a signal-lantern, a frame-arm, a color-glass held thereby, a cam end to said frame-arm, a pivot for the frame-arm, means for operating the said arm and a double end or loop spring having a central hump and adjacent depressions adapted to engage the cam end of the frame-arm and hold the same in either its operative or inoperative position.

8. In a signal-lantern, a frame-arm and a color-glass received thereby, said frame-arm having an opening other than circular, a sleeve having a surface configuration adapted to fit said opening and constructed so as to be turned by hand, a shaft passing through said sleeve, a second frame-arm and a color-glass held thereby having a smaller opening other than circular and adapted to receive a portion of said shaft having a corresponding surface configuration, substantially as described.

9. In a signal-lantern, a frame-arm and a color-glass received thereby, said frame-arm having an opening other than circular, a sleeve having a surface configuration adapted to fit said opening and constructed so as to be turned by hand, a shaft passing through said sleeve, a second frame-arm and a color-glass held thereby having a smaller opening other than circular and adapted to receive a portion of said shaft having a corresponding surface configuration, and each arm provided adjacent to its opening, with a rounded or cam end, and springs each adapted to bear upon said cam end and having a hump coming at either one side or the other of said cam ends so as to hold said arms in their operative and inoperative positions.

818,782. **FENCE-POST.** WILLIAM J. RAGS, Dayton, Ohio. Filed Oct. 30, 1905. Serial No. 284,994.



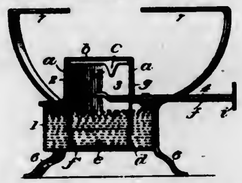
Claim.—1. A fence-post comprising a body and a longitudinal plate projecting therefrom, said plate being provided with wire-receiving grooves extending from the margin of the plate to the face of the body and having seats or recesses for the wires opening toward said body, and a locking-rod adapted to fit between the body and said recesses adjacent to the plate and prevent the wires in said recesses from entering the slots, substantially as described.

2. A fence-post comprising a body and a longitudinal plate projecting therefrom, said plate being provided with wire-receiving grooves extending from the margin of the plate to the face of the body and having seats or recesses for the wires opening toward said body, and a locking-rod adapted to fit between the body and said recesses adjacent to the plate and prevent the wires in said recesses from entering the slots, said body being provided with means for preventing lateral motion of the locking-rod away from the plate.

3. A fence-post comprising a cement body and a combined reinforcing and wire-supporting member consisting of a plate extending longitudinally of the portion of the post above ground, partly embedded therein to reinforce the same, and having its projecting part provided with wire-receiving grooves terminating in inwardly-opening recesses, pins projecting from the body along one side of the plate, and a locking-rod fitting between the pins and plate against the face of the body and adapted to close the mouths of the recesses, substantially as described.

4. A fence-post comprising a body and a longitudinal plate projecting therefrom, the projecting portion of the plate being provided with wire-receiving slots terminating in inwardly-opening recesses, and a free locking-rod adapted to fit between the recesses and the face of the body adjacent to the plate and having its upper extremity adapted to engage the plate, substantially as described.

813,783. **ALCOHOL-BURNER.** JOHN H. RENEY, Brooklyn, N. Y., assignor to Silver & Company, Brooklyn, N. Y., a Corporation of New York. Filed June 14, 1905. Serial No. 265,208.



Claim.—1. The combination in an alcohol-burner, of a burner-bowl having above its body a relatively contracted neck portion provided circumferentially with jet-orifices, a perforated crown-flange fixed to the bottom of the bowl in axial alinement with the neck portion, a vertically-movable flame-regulator consisting of an open-ended cylinder guided by the neck portion and the crown-flange, and means operating at the axis of the flame-regulator for raising and lowering it.

2. The combination in an alcohol-burner, of a burner-bowl having above its body a relatively contracted neck portion provided circumferentially with jet-orifices, a perforated crown-flange fixed to the bottom of the bowl in axial alinement with the neck portion, a vertically-movable flame-regulator consisting of an open-ended cylinder guided by the neck portion and the crown-flange and having a vertical slot therein, a radial tube fixed to the top of said body portion and projecting inwardly through said neck portion and said slot to the axis of said cylinder, a crank-shaft journaled in said tube with the crank at its inner end, and a slotted cross-bar fixed diametrically

in said cylinder to interact with said crank for moving said flame-regulator.

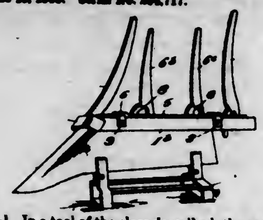
818,786. **PROCESS OF PRODUCING METALLIC OXIDS.** LAURENT-PIERE-HUGUENOT, Paris, France. Filed Jan. 10, 1905. Serial No. 240,494.

in one of said members and having a tongue adapted to be pivoted in the recess or bifurcated end of said base, a head having a socket member at one end adapted to receive the upper end of one of said side

Claim.—1. A string-frame for pianofortes and like musical instruments, having an approximately circular opening and a sound-

in said cylinder to interact with said crank for moving said flame-regulator.

813,784. SHAPING-TOOL. CONRAD FREITAG, Goodrich, N. D. Filed June 16, 1905. Serial No. 265,717.



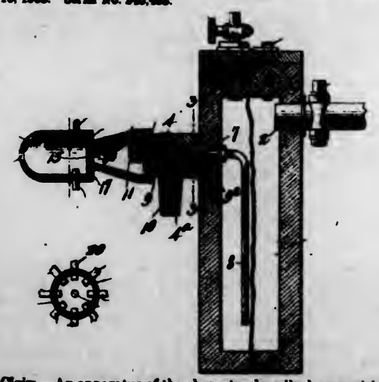
Claim.—1. In a tool of the class described, the combination of a holder embodying spaced longitudinal bars, members connecting said bars, a clamp member arranged between the longitudinal bars of the holder and mounted upon the members connecting said bars, and cam-levers arranged to coact with the clamp member to actuate the same.

2. In a tool of the class described, the combination of a holder embodying spaced longitudinal bars, members connecting said bars, a clamp member arranged between the longitudinal bars of the holder and mounted upon the members connecting said bars, levers pivoted to a side of the holder, and cams extended from said levers to engage between the clamp member and a side of the holder for actuating said clamp member.

3. In a tool of the class described, the combination of a holder embodying spaced longitudinal bars, a loop extension at one end of the holder, a clamp member mounted between the longitudinal bars of the holder, and a plurality of cam-levers mounted upon the holder and arranged to coact with the clamp member.

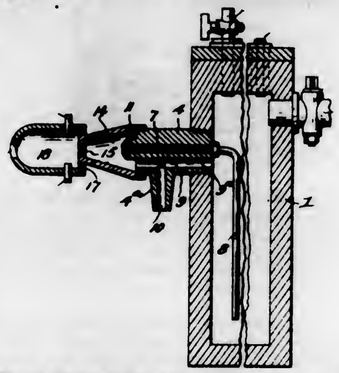
4. In a tool of the class described, the combination of a holder consisting of spaced longitudinal bars, members connecting said bars at intervals between the ends thereof, a clamp-bar extending longitudinally between the bars of the holders and provided with openings through which the members connecting the bars of the holder pass, levers having one end bifurcated, one of the bifurcated portions of each lever being pivotally attached to the side of the holder, the other bifurcated portion being formed into a cam extension.

813,785. APPARATUS FOR THE PREPARATION OF METALLIC OXIDS. LAURENT FIRE-HUGUENOT, Paris, France. Filed Jan. 10, 1905. Serial No. 240,483.



Claim.—An apparatus of the character described, comprising a container for molten metal, a discharge connection therefor formed with a conduit 7 for molten metal and conduits 9 and 10 for an elastic fluid, and an apertured, truncated cone upon the outer end of said discharge connection, into which the forward end of the conduits 7 and 9 open, radially-projecting burner-tubes 20 extending from said discharge connection, whereby when an elastic fluid is admitted into said conduit 10, a portion will enter said container to force the molten metal therein out of said conduit 7 and into said cone and the remaining portion of said fluid will enter said cone and cause a vortex stirring action in the same and expel the mixture through the aperture in said cone, substantially as described.

813,786. PROCESS OF PRODUCING METALLIC OXIDS. LAURENT FIRE-HUGUENOT, Paris, France. Filed Jan. 10, 1905. Serial No. 240,484.



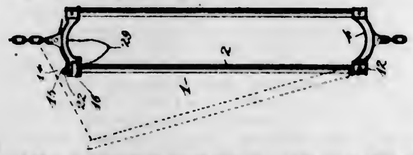
Claim.—The herein-described process of producing metallic oxids, which consists in forcing a fused metal to flow in a current under the action of a strong pressure, mingling an elastic fluid with said current, utilizing a portion of the force of the elastic fluid to create said strong pressure, confining the current to a restricted space to form a vortex jet and finally directing an oxidizing-flame against said jet, essentially as described.

813,787. HAIR-PIN. LLEWELLYN H. FLORY, Ashley, Pa. Filed Mar. 20, 1905. Serial No. 250,732.

Claim.—1. A hair-pin having a head provided with coils constituting stops, and legs having their terminals outturned and normally in engagement.

2. A hair-pin having a head provided on opposite sides with intermediate coils, with shoulders adjacent to the coils, and with crossed legs having their terminals normally in engagement.

813,788. STANCHION. JOHN FOSTER, Rochester, N. Y. Filed June 5, 1905. Serial No. 263,511.



Claim.—1. A stanchion comprising a pair of bars, one of which is adapted to swing, a hook upon said swinging bar, lateral projections adjacent to said hook, a head upon the other of said bars and formed with a recess to receive said hook and with grooves to the walls of said recess to receive said projections and a swinging latch upon said head and formed with a slot to receive said hook, substantially as described.

2. A stanchion comprising a tubular side member, a base secured to one end of said member, a slotted head secured to the other end of said member, a tubular swinging side member pivotally connected to one end of said base, an outwardly-extending hook 14 upon the free end of said side member, a guide upon one end of said head, a latch pivoted within said head and formed with a slot to receive said hook 14, a spring connected to said latch and head, said latch having a finger-piece 25, a flexible connection 29 attached to said swinging side member and to said slotted head to limit the opening movement of said swinging member, and a chain for suspending said stanchion, substantially as described.

3. A stanchion comprising two tubular side members a cast base having a tubular socket at one end to receive one of said members and a slotted or bifurcated portion at its opposite end, a plug secured

in one of said members and having a tongue adapted to be pivoted in the recess or bifurcated end of said base, a head having a socket member at one end adapted to receive the upper end of one of said side members and formed at its opposite end with a guide to receive the upper end of the other of said side members, said guide comprising a slot or recess formed with grooves in its walls, a hook upon the upper end of the pivoted side member adapted to enter the slot of said guide, lugs upon said hook to enter the grooves of said guide, a latch pivoted in a slot in said head and formed with an upturned slotted end adapted to engage said hook, a finger-piece upon said latch, a spring for holding said latch normally in engagement with said hook, and a chain or other flexible connection for limiting the swinging movement of said pivoted side member.

813,789. JAR-HOLDER. ANNIE FOX, Marietta, Mich. Filed Feb. 16, 1905. Serial No. 245,969.

Claim.—A jar-holder comprising two frames each formed of a single wire and including vertically-spaced members connected at their outer ends by an upwardly-arched portion and at their lower ends by a portion having its central part displaced upwardly, upper and lower semicircular wires secured to each frame, the oppositely-lying wires of the two frames having at one end interlocking eyes and having at their opposite ends one a hook and the other an eye disposed for engagement by the hook, the upwardly-displaced portions of the frames being arranged to receive and support a jar.

813,790. FLEXIBLE ADHESIVE BRACE. ALFRED FRESCHL, Chicago, Ill. Filed Aug. 19, 1905. Serial No. 274,576.

Claim.—1. The herein-described flexible adhesive brace, comprising the body portion 2 formed of flexible material with the end portions 4 4 covered with an adhesive material and the center plain portion 5, substantially as described and for the purpose set forth.

2. The herein-described flexible adhesive brace, comprising the body portion 2 formed of flexible material with the end portions 4 4 covered with an adhesive material, the center plain portion 5, and the recess 3, substantially as described and for the purpose set forth.

813,791. PIANOFORTE. JOHN W. GALLOWAY, Linton, Ind. Filed Nov. 8, 1905. Serial No. 286,262.

Claim.—1. A string-frame for pianofortes and like musical instruments, having an approximately circular opening and a sounding-board of corresponding shape fitted in said opening.

2. A string-frame for pianofortes and like musical instruments having an opening of approximately circular outline, a sounding-board arranged within said opening, and a rim encircling the sounding-board and filling the space between it and the wall of the said circular opening of the string-frame.

3. A string-frame for pianofortes and like musical instruments having an opening of approximately circular outline, a sounding-board arranged within said opening, and a rim encircling the sounding-board and filling the space between it and the wall of the said circular opening of the string-frame, said rim being firmly attached to both the sounding-board and string-frame.

4. A string-frame for pianofortes and like musical instruments having an opening of approximately circular outline, a sounding-board arranged within said opening, and a rim encircling the sounding-board and filling the space between it and the wall of the said circular opening of the string-frame, said rim being of wood and having a circular outline.

5. A string-frame for pianofortes and like musical instruments having an opening of approximately circular outline, a sounding-board arranged within said opening, and a rim encircling the sounding-board and filling the space between it and the wall of the said circular opening of the string-frame, said rim being of wood and of a laminated structure, the layers being secured to one another and to the sounding-board and the string-frame.

6. A string-frame for pianofortes and like musical instruments provided with an opening of approximately circular outline adapted to receive a sounding-board, and strings extending across the opening of the string-frame and attached to the latter at opposite points.

7. A string-frame for pianofortes and like musical instruments having an opening of approximately circular outline, a sounding-board of corresponding shape to said opening and fitted therein and a continuous bridge attached to said sounding-board.

8. A string-frame for pianofortes and like musical instruments provided with an opening of approximately circular outline, a sounding-board of corresponding shape to the opening and fitted therein, and a rim snugly fitting within said opening of the string-frame and having its inner wall rabbeted to form a seat for reception of the sounding-board, the three parts being firmly united or bonded.

813,792. HOSE-COUPLING. SHADRACK W. GOOCH, Bridgeport, Ohio, and WILLIAM C. LEASURE, Wheeling, W. Va. Filed Mar. 6, 1905. Serial No. 248,746.

Claim.—1. The combination with coacting coupler members, of a serrated band carried interiorly by one of said members, a spring-actuated pawl carried by the second member and adapted to engage the band, radially-movable buttons carried by the second member, and pins carried by the buttons and adapted to move the said pawl.

2. The combination with coacting coupler members, one of said members having an interior band of teeth, the other member being recessed and circumferentially grooved adjacent the recesses, pawls pivotally mounted in the grooves, springs adapted to force the pawls outwardly into engagement with the teeth of the first-mentioned member, buttons movable radially in the recesses and pins carried by the buttons and in engagement with the pawls.

3. The combination with coupling members having interlocking lugs, teeth carried on the interior of one member, the other member being recessed and grooved at diametrically opposite points, pawls pivotally mounted in the grooves, springs arranged in the grooves and adapted to force the pawls outwardly, buttons movable inwardly and outwardly in the recesses, and pins carried by the buttons and secured to the pawls, as and for the purpose set forth.

813,793. HOSE-SUPPORTER. VICTOR GUIMBEAU, New York, N. Y. Filed June 9, 1905. Serial No. 264,570.

Claim.—A hose-supporter comprising a belt formed in two parts

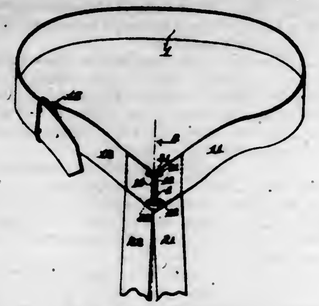
having diagonally-cut ends secured closely together by means of a plurality of thin separated staples and by stitching which covers the staples, and hose-supporting straps each spanning the belt adjacent

electric energy and including the said roll and said insulated rolling-surface, a pair of rolls arranged in proximity to said table said rolls being insulated from one another

of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impres-

face to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said

having diagonally-cut ends secured closely together by means of a plurality of thin separated staples and by stitching which covers the staples, and hose-supporting straps each crossing the belt adjacent the staples and being stitched securely thereto, substantially as described.



813,794. APPARATUS FOR FORMING SHEET AND PLATE GLASS. HARRY J. HAYS, Pittsburg, Pa., assignor to Edward F. Hays, trustee. Pittsburg, Pa. Filed Aug. 9, 1904. Serial No. 220,000.

Claim.—1. An apparatus of the type set forth, comprising a body of insulating material mounted upon legs, a receptacle seated in said insulating material and having a hollow interior and adapted to receive a cooling liquid and having an inlet-pipe and an outlet-pipe, the upper side of said receptacle constituting a rolling-surface, a roller mounted above said receptacle and out of contact therewith, means for transmitting a current of electricity through said receptacle and through said roller and means for moving said roller in a horizontal direction above said rolling-surface.

2. An apparatus of the character described, comprising legs, a receptacle mounted on said legs and insulated therefrom, a roller mounted above said receptacle and out of contact therewith, means for propelling said roller along said receptacle, means for passing an electric current through said receptacle and through said roller and means for varying the resistance of an electric circuit including said roller and said receptacle.

3. An apparatus of the type set forth, comprising a table having a rolling-surface, a roller adjustably mounted above and out of contact with said rolling-surface, means for propelling said roller along the table and for positively revolving the roller as it is propelled along the table, means for passing an electric current through said table and said roller and means for cooling said table.

4. An apparatus of the type set forth comprising a hollow table, having inlet and outlet ports, and an insulating-lining, means for supplying water and causing it to pass through said table, a roll adjustably mounted above said table, means for passing an electric current through said table, and said roll, and means for propelling said roll along said table.

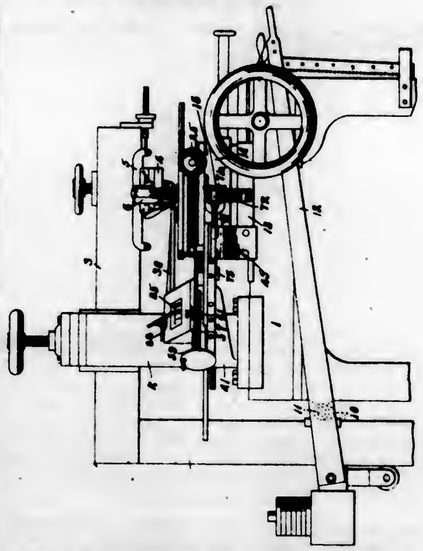
5. In an apparatus of the character described, the combination of a table, racks carried by brackets mounted on the table, a roll, pinions carried by said roll and meshing with said racks, and means carried by the said brackets and coengaging means mounted on the table for adjusting said brackets vertically.

6. In an apparatus of the character described, the combination of a table, vertical supporting-arms mounted at each end of the table and having racks formed on their edges, pinions engaging said racks, shafts on which said pinions are mounted, connections between said shafts, means for turning the shafts, and a roll supported by said brackets.

7. In an apparatus of the character described, the combination of a table, a roll mounted above the table, an insulated rolling-surface mounted on said table, an electric circuit including a source of electric energy and including the said roll and said insulated rolling-surface, a pair of rolls arranged in proximity to said table said rolls being insulated from one another and an electric circuit including said pair of rolls, and a source of electric energy.

8. In an apparatus of the character described, the combination of a table, brackets mounted at each edge of the table, a roll having a shaft, supported by said brackets and adapted to roll on the same, and a depending arm carried by said shaft and engaging the table to steady the roll in its movement over the table.

813,795. TRANSFER-PRESS. JOHN R. HILL, Washington, D. C. Filed Jan. 26, 1905. Serial No. 242,678.



Claim.—1. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said primary surface for adjusting the latter, actuating means for said adjusting means, a proportional-spacing mechanism, a second actuating means carried by said proportional-spacing mechanism, and means constructed to independently connect either of said actuating means to said adjusting means, substantially as described.

2. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said primary surface for adjusting the latter, actuating means for said adjusting means, a proportional-spacing mechanism, a second actuating means carried by said proportional-spacing mechanism, means constructed to independently connect either of said actuating means to said adjusting means, and vernier mechanisms arranged to accurately indicate the extent of movement of said two actuating means, substantially as described.

3. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said primary surface for adjusting the latter, two actuating means for said adjusting means, and means constructed to independently connect either of said actuating means to said adjusting means, substantially as described.

4. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said primary surface for adjusting the latter, two actuating means for said adjusting means, means constructed to independently connect either of said actuating means to said adjusting means, and vernier mechanisms arranged to accurately indicate the extent of movement of said two actuating means, substantially as described.

5. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said primary surface for adjusting the latter, actuating means for said adjusting means, a proportional-spacing mechanism, a second actuating means carried by said proportional-spacing mechanism, and means constructed to independently connect either of said actuating means to said adjusting means, substantially as described.

6. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said primary surface for adjusting the latter, actuating means for said adjusting means, a proportional-spacing mechanism, a second actuating means carried by said proportional-spacing mechanism, means constructed to independently connect either of said actuating means to said adjusting means, and vernier mechanisms arranged to accurately indicate the extent of movement of said two actuating means, substantially as described.

7. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, means constructed to produce universal adjustment of said support relative to said primary surface, adjusting means detachably connected to said primary surface for adjusting the latter, and means constructed to actuate said adjusting means, substantially as described.

8. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired character in their required relative arrangement, means constructed to produce universal adjustment of said support relative to said primary surface, adjusting means detachably connected to said primary surface for adjusting the latter, two acuating means for said adjusting means, and means constructed to independently connect either of said actuating means to said adjusting means, substantially as described.

9. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said primary surface for adjusting the latter, means constructed to actuate said adjusting means, and means constructed to impress the desired characters in the secondary surface in their required relative arrangement, substantially as described.

10. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said primary surface for adjusting the latter, two actuating means for said adjusting means, means constructed to independently connect either of said actuating means to said adjusting means, and means constructed to impress the desired characters in the secondary surface in their required relative arrangement, substantially as desired.

11. In an apparatus of the character described, the combination of an adjustably-mounted primary surface provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said primary surface for adjusting the latter, actuating means for said adjusting means, an adjustable proportional-spacing mechanism, means constructed to lock said adjustable spacing mechanism in its adjusted positions, a second actuating means carried by said proportional-spacing mechanism, and means constructed to independently connect either of said actuating means to said adjusting means, substantially as described.

12. In a transfer-press, the combination of a transfer-roll provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said transfer-roll for adjusting the latter, and means constructed to actuate said adjusting means, substantially as described.

13. In a transfer-press, the combination of a transfer-roll provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said transfer-roll for adjusting the latter, two actuating means for said adjusting means, and means constructed to independently connect either of said actuating means to said adjusting means, substantially as described.

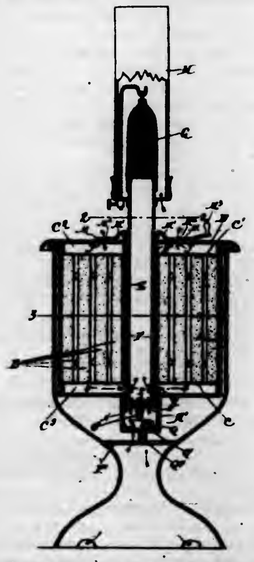
14. In a transfer-press, the combination of an adjustable support, a transfer-roll mounted in said support and provided with a plurality of characters and corresponding index-marks, said index-marks positioned about said roll angularly to the respective corresponding character, a pointer carried by said roll-support in cooperative relation to said index-marks, and a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, substantially as described.

15. In a transfer-press, the combination of an adjustable support, a transfer-roll mounted in said support and provided with a plurality of characters and corresponding index-marks, said index-marks positioned about said roll angularly to the respective corresponding character, a pointer carried by said roll-support in cooperative relation to said index-marks, a support for a secondary surface to receive impressions of the desired characters in their required relative arrangement, adjusting means detachably connected to said transfer-roll for adjusting the latter, and means constructed to actuate said adjusting means, substantially as described.

16. In an apparatus of the character described, the combination of an adjustable support, a primary surface carried thereby provided with a plurality of characters, a support for a secondary surface to receive impressions of the desired characters, a proportional-spacing mechanism, an adjusting means carried by said proportional-spacing mechanism and arranged to detachably engage said primary-surface support, actuating means carried by said proportional-spacing mechanism for actuating said adjusting means, a second actuating means for said adjusting means, and means constructed to independently connect either of said actuating means to said adjusting means, substantially as described.

17. In an apparatus of the character described, the combination of an adjustable support, a pointer carried by said support, a transfer-roll mounted in said support and provided with a plurality of characters and corresponding index-marks, said index-marks positioned about said roll angularly to the respective corresponding characters, substantially as described.

813,796. CARBURETER. GEORGE H. HOLGATE, Philadelphia, Pa. Filed Oct. 16, 1905. Serial No. 283,976.



Claim.—1. A carburetor consisting of a foot or receptacle, absorbent material contained within said receptacle, said absorbent

material so arranged as to leave a space above and below the same within the receptacle, a stationary tube extending downward through the center of the receptacle open at its upper end and closed at its

3. A car-truck comprising a combined truck-bolster and spring-support, springs mounted upon said spring-support, side bearings

2. In a trussed brake-beam, the combination with a cylindrical thrust-block having a groove in its periphery, of a removable brake-

the seat so as to pivot the seat near its back to the chair-frame, means for supporting the back in one of several positions, and a foot-rest

material so arranged as to leave a space above and below the same within the receptacle, a stationary tube extending downward through the center of the receptacle open at its upper end and closed at its lower end, a central gas-tube arranged within the first-named tube, said gas-tube also closed at its lower end and open at its upper end, means for causing the central gas-tube to remain stationary, a middle tube arranged between the two aforesaid tubes and adapted to revolve around between the same, ports formed through the walls of the two stationary tubes coincident with one another within the space below the absorbent material, openings formed through the walls of the revolving tube adapted to be brought in and out of register with the ports of the stationary tube, openings formed through the top of the font, a valve connected to the revolving tube for opening and closing these ports when the tube is revolved, ports for admitting air through the lower end of the gas-tube, means for opening and closing these ports by the revolution of the revolving tube, the bottom of the font provided with an opening for admitting air to the central gas-tube, means for closing said opening when the font is to be filled with a liquid, a chimney surrounding the upper end of the gas-tube, a burner arranged over the upper end of the tube within the chimney, as and for the purpose specified.

2. In a carbureter for lamps and the like, a font or receptacle, absorbent material contained within said font or receptacle, said absorbent material so arranged within the font as to leave a space above and below the same, a removable top for closing the upper end of the font, a tube open through the top at its upper end extending downward through the absorbent material to a point near the lower end of the font, the lower end of said tube being closed, a gas-tube arranged within the other tube, said gas-tube extending above the font and open at its upper end, the lower end being closed, means for causing said gas-tube to remain stationary, a middle tube arranged between the two other tubes and adapted to revolve in close contact with both of said tubes, the two stationary tubes provided with ports coincident with one another formed through the walls of the same within the space below the absorbent material, the revolving tubes provided with openings adapted to be brought in and out of register with the ports as the tube is revolved, the top of the font provided with openings, a ring lying flat over said openings, spring-arms connecting said ring with the revolving tube so that the ring will be held in spring contact with the tube, said ring provided with openings adapted to be brought in and out of register with the openings through the tube when the tube is revolved, the lower end of the two stationary tubes being provided with ports formed through the same coincident with one another, the lower end of the revolving tube being provided with openings adapted to be brought in and out of register with said ports when the tube is revolved, means for revolving said tube, the lower end of the font being provided with an opening through which air is admitted to the lower end of the gas-tube, a hollow body in which the font is adapted to rest, a valve for controlling the opening through the lower end of the font, means for automatically opening said valve when the font is placed within the body, and means for automatically closing the valve when the font is removed, a chimney arranged around the upper end of the gas-tube, and a burner within the chimney arranged above the gas-tube, as and for the purpose specified.

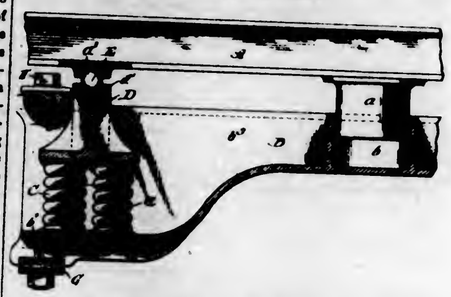
3. In a carbureter, a receptacle, absorbent material arranged within the receptacle, said absorbent material formed in the shape of concentric rings nested one inside of the other and spaced a distance apart, means for holding said rings at equal distances apart, a perforated screen arranged within the receptacle a slight distance above the bottom of the same upon which the absorbent rings rest, the absorbent rings extending upward to within a short distance of the top of the receptacle so as to leave a space above the same, means for admitting air to the upper space, means for taking the mixed air and vapor from the lower space, and means for controlling these inlets from the exterior of the receptacle, as specified.

813,797. **RAILWAY-CAR TRUCK.** JAMES M. HOPKINS, Chicago, Ill. Filed June 12, 1905. Serial No. 264,768.

Claim.—1. A car-truck comprising a combined truck-bolster and spring-support formed integrally and of metal, springs mounted upon said spring-support, and a side bearing mounted upon said springs and provided in its top surface with a bearing-surface to receive the weight of the body-bolster.

2. A car-truck comprising a combined truck-bolster and spring-support formed integrally and of metal, springs mounted upon said spring-support, a side bearing mounted upon said springs and provided in its top with a grooved bearing-surface to receive the weight of the body-bolster.

3. A car-truck comprising a combined truck-bolster and spring-support, springs mounted upon said spring-support, side bearings mounted upon said springs and provided in their tops with bearing-surfaces, a body-bolster having integral bearing-surfaces extending over the bearing-surfaces of the side bearings, and bearing-balls loosely disposed between said bearing-surfaces.



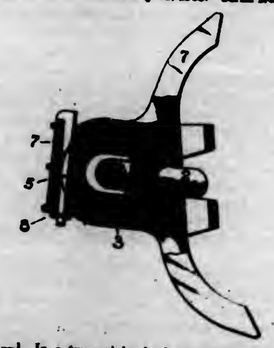
4. A car-truck comprising a combined truck-bolster and spring-support, springs mounted upon said spring-support, side bearings mounted upon said springs and provided in their tops with grooved bearing-surfaces, a body-bolster having integral grooved bearing-surfaces extending over the bearing-surfaces of the side bearings, and bearing-balls loosely disposed in the grooves in said bearing-surfaces.

5. A car-truck comprising a combined truck-bolster and spring-support, springs mounted upon said spring-support, side bearings mounted upon said springs and provided in their tops with grooved bearing-surfaces, a body-bolster having integral grooved bearing-surfaces extending over the bearing-surfaces of the side bearings, the grooves in both said surfaces being formed deeper at their centers than at their ends, and bearing-balls loosely disposed in said grooves.

6. A car-truck comprising a combined truck-bolster and spring-support formed integrally of metal and provided at its center with a socket to receive the center of the truck, springs mounted upon said spring-support, side bearings mounted upon said springs and provided in their tops with grooved bearing-surfaces, a body-bolster having integral grooved bearing-surfaces extending over the bearing-surfaces of the side bearings, the grooves in both said surfaces being formed deeper at their centers than at their ends, and bearing-balls loosely disposed in said grooves.

7. The combination with a combined truck-bolster and spring-support formed integral and of metal and provided at its ends with laterally-extended seats to receive the upper and lower truss-bars of the side frames, of bolts passing through said seats and truss-bars to retain said parts in position.

813,798. **BRAKE-BEAM.** CHARLES F. HUNTOON, Chicago, Ill., assignor to Chicago Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed July 18, 1905. Serial No. 270,172.

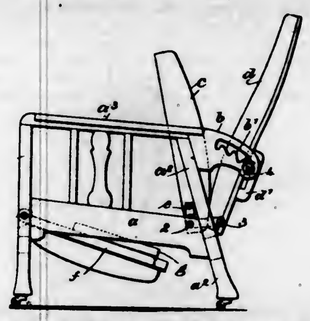


Claim.—1. In a trussed brake-beam, the combination with a thrust-block provided with a groove, of a removable brake-head, and a key or pin passing through said brake-head and through said groove in the thrust-block; substantially as described.

2. In a trussed brake-beam, the combination with a cylindrical thrust-block having a groove in its periphery, of a removable brake-head provided with an opening registering with said groove, and a key or pin passing through said opening and fitting in said groove; substantially as described.

3. In a trussed brake-beam, the combination with a cylindrical thrust-block having a groove in its periphery, of a removable brake-head provided with an opening registering with said groove, and a wedge key or pin passing through said opening and fitting in said groove, whereby said wedge-key tends to make the parts fit tight; substantially as described.

813,799. **RECLINING-CHAIR.** GEORGE HUNNEMAN, New York, N. Y. Filed July 10, 1905. Serial No. 268,913.



Claim.—1. In a reclining-chair, a seat, pivotal connections from the seat to the chair-frame, a back and pivotal connections at the lower end of the back to the seat and a rod and coacting devices for supporting the back in an adjustable inclined relation whereby the back has a sliding movement on the rod by and simultaneously with the movement of the seat.

2. In a reclining-chair, a seat, pivotal connections from the seat to the chair-frame, a back and pivotal connections at the lower end of the back to the seat, a rod and coacting devices for supporting the back in an adjustable inclined relation, and a foot-rest and pivots for connecting the same between the front uprights of the chair-frame, said foot-rest normally occupying a position beneath the seat and between the side members of the chair-frame, and the relation of the seat and back as specified, being such that they may be folded closely together so as to provide a space for swinging the foot-rest outward into its position for use.

3. The combination with the chair-frame of a seat, a device secured at each side and near the back of the seat, a back and pivot-pins for pivotally connecting the back near its lower end to the free ends of said devices secured upon the sides to the seat, whereby the seat and back occupy a pivotal relation to one another, pivot-pins passing through the side members of the chair-frame and through the said devices secured to the seat so as to pivot the seat near its back to the chair-frame, and means for supporting the back in one of several inclined positions and producing a sliding movement of the back on said rod with the movement of the seat.

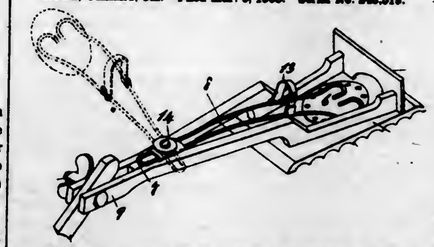
4. The combination with the chair-frame, of a seat, devices secured at the sides and near the back of the seat, a back and pivot-pins for pivotally connecting the back near its lower end to the said devices secured to the seat whereby the seat and back occupy a pivotal relation to one another, pivot-pins passing through the side members of the chair-frame and through the said devices secured to the seat so as to pivot the seat near its back to the chair-frame, slotted brackets forming devices of the side members of the chair-frame and provided with ratchet-teeth, cleats secured to the rear surface of the back and a rod passing through said cleats and through the slots of the brackets to support the back in any one of several inclined positions and afford a sliding movement to the back on said rod, and which rod is moved thereby simply by the movement of the back when the same is raised to change its inclination.

5. The combination with the chair-frame, of a seat, devices secured at the sides and near the back of the seat, a back and pivot-pins for pivotally connecting the back near its lower end to the said devices secured to the seat whereby the seat and back occupy a pivotal relation to one another, pivot-pins passing through the side members of the chair-frame and through the said devices secured to the seat so as to pivot the seat near its back to the chair-frame, means for supporting the back in one of several positions, and a foot-rest comprising a frame and pivoted leg-frame, said frame being pivotally connected by pins 5 to and between the front uprights of the chair-frame and adapted to occupy an initial position below the seat, and when the seat and back are folded to swing outward into a horizontal position for use.

6. The combination with the chair-frame, of a seat, devices secured at the sides and near the back of the seat, a back and pivot-pins for pivotally connecting the back near its lower end to the said devices secured to the seat whereby the seat and back occupy a pivotal relation to one another, pivot-pins passing through the side members of the chair-frame and through the said devices secured to the seat so as to pivot the seat near its back to the chair-frame, and a foot-rest comprising a frame and pivoted leg-frame, said frame being pivotally connected by pins 5 to and between the front uprights of the chair-frame and adapted to occupy an initial position below the seat and when the seat and back are folded to swing outward into a horizontal position for use.

7. In a reclining-chair, the combination with the chair-frame, of a seat and back, straps *e* of L form secured to the seat near the rear portion, pivot-pins 3 connecting the free ends of said straps to the back at its lower end, and pivots 2 passing through the chair-frame and said straps into the seat for pivoting the seat to the chair-frame.

813,800. **WINDOW-CLEANER.** ANNIE M. JOHNSON and DAVID H. ROWE, Oakland, Cal. Filed Mar. 6, 1905. Serial No. 248,519.



Claim.—1. A cleaner consisting of a substantially rectangular body portion transversely corrugated on its working face and provided with an angularly-disposed rigid scraper-plate on its opposite side, a handle and means for removably holding the ends of a cleaning or like fabric on the back of the body portion.

2. A cleaning device comprising a body portion transversely corrugated on one side, a handle secured to the opposite side, an angular rigid scraper-plate secured to the handle side of the body, a fabric passed over the corrugated surface of the body and over said scraper and having its ends brought together on the back of said body portion and a spring-clamp to hold the ends of said fabric, said spring-clamp being pivoted to the handle and arranged to swing laterally of said body.

3. A cleaning device comprising a body portion transversely corrugated on one side, a handle secured to the opposite side, an angular rigid scraper-plate secured to the handle side of the body, a fabric passed over the corrugated surface of the body and over said scraper and having its ends brought together on the back of said body portion, and a spring-clamp to hold the ends of said fabric.

4. A cleaning device comprising a rectangular body portion, a handle secured thereto, a spring pivoted intermediate of its ends to said handle and arranged to swing laterally of the body, and a presser-plate carried by said spring and arranged to impinge upon the back of the body.

813,801. **FIREARM.** THOMAS C. JOHNSON, New Haven, Conn., assignor to Winchester Repeating Arms Co., New Haven, Conn., a Corporation. Filed Oct. 16, 1905. Serial No. 283,009.

Claim.—1. In a firearm, the combination with the frame thereof, of a non-recoiling barrel, a balanced breech-block having a forwardly-projecting extension embracing the said barrel, a breech-block-closing spring encircling the said barrel, and a friction-brake

hounted at the forward end of the said extension and coacting directly with the non-recoiling barrel to retard the opening move-

of each are parallel to each other, the several bars being inclined from the middle portion of the main tension member.

stools, and extending around the under-arm sides and with their free

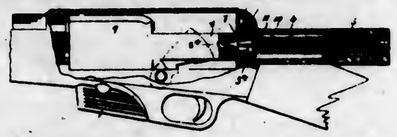
ment of said rock to open and close said doors, means to look said le-

located at the forward end of the said extension and coacting directly with the non-recoiling barrel to retard the opening movement of the breech-block and so reduce the shock of recoil.

2. In a firearm the combination with the frame thereof, of a non-recoiling barrel, a balanced breech-block having a forwardly-projecting extension turned upwardly at its forward end and formed with a conical friction-brake chamber, a breech-block-closing spring, and a sleeve-like friction-brake located in the said chamber and embracing the barrel with which it coacts to retard the opening movement of the breech-block and so reduce the shock of recoil.

3. In a firearm, the combination with the frame thereof, of a non-recoiling barrel, a balanced breech-block having a forwardly-projecting extension upturned at its forward end and formed with a friction-brake chamber, a breech-block-closing spring encircling the rear end of the said barrel, a jacket to inclose the said spring, and a friction-brake located in the said chamber and clasping the barrel upon which it is forced at the time of recoil by the walls of the said chamber, whereby during the opening movement of the block the brake is dragged over the barrel and the shock of recoil reduced.

813,802. **FIREARM.** THOMAS C. JOHNSON, New Haven, Conn., assignor to Winchester Repeating Arms Co., New Haven, Conn., a Corporation. Filed Oct. 16, 1905. Serial No. 282,863.

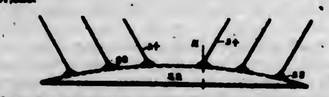


Claim.—1. In a gun, the combination with the frame thereof, of a balanced breech-block having a rearward extension containing a brake-chamber, a stationary rod supported at its rear end by the said frame, a friction-brake located in the said chamber and coacting with the said rod to retard the opening movement of the block and so reduce the shock of recoil.

2. In a gun, the combination with the frame thereof, of a balanced breech-block having a friction-brake chamber, a sleeve secured by its forward end in the rear end of the said frame and extending rearwardly therefrom, a rod mounted at its rear end in the rear end of the said cylinder, a breech-block-closing spring located in the said sleeve and encircling the said rod, and a friction-brake located in the said chamber and coacting with the said rod to retard the opening movement of the block and so reduce the shock of recoil.

3. In a gun, the combination with the frame thereof, of a balanced breech-block having a rearward extension containing a brake-chamber, a stationary rod, means carried by the gun-frame at the rear end thereof for supporting the said rod by its rear end, a breech-closing spring encircling the said rod, and a friction-brake located in the said chamber and coacting with the said rod to retard the opening movement of the block and so reduce the shock of recoil.

813,803. **COMBINED STEEL AND CONCRETE BEAM.** JULIUS KAHN, Detroit, Mich., assignor to Trussed Concrete Steel Company, Detroit, Mich., a Corporation of Michigan. Filed Oct. 7, 1904. Serial No. 227,852.



Claim.—1. A tension member for composite window and door lintels, comprising a hollow body having a convex top, and having portions thereof slitted and raised to form loops, and auxiliary tension members attached to said loops.

2. A tension member for combined concrete and metal structures, comprising a main tension member having loops struck up from the same, and substantially U-shaped auxiliary members engaging said loops.

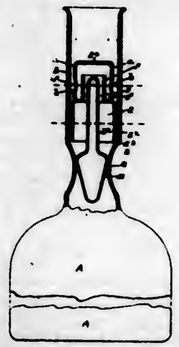
3. A metal tension member for composite structures, comprising a main tension member having loops struck up from the same, and substantially U-shaped auxiliary members passing through said loops, their projecting portions being parallel.

4. A metal tension member for composite structures, comprising a main tension member having a series of loops struck up from the same, and flat bars engaging said loops at the middle of their length, said bars being bent upward so that the projecting portions of each are parallel to each other, the several bars being inclined from the middle portion of the main tension member.

5. In a composite structure, the combination of a tension member comprising a hollow body with a convex top, loops struck up from said top and laterally-projecting flanges, auxiliary tension members engaging said loops and projecting upward, plastic bodies laid up on said flanges to form parallel walls, and a cementitious body filling the space between said walls and molded around said auxiliary tension members.

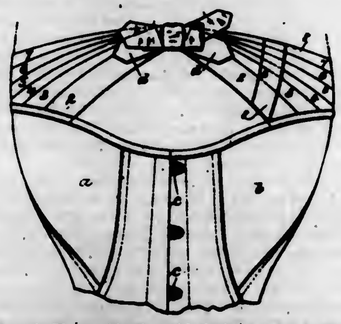
6. A tension member for combined concrete and metal structures, comprising a main tension member having loops struck up from the body of the same, and auxiliary tension members engaging said loops.

813,804. **NON-REFILLABLE BOTTLE.** JOHN M. KILDUFF, Boston, Mass. Filed May 10, 1905. Serial No. 259,881.



Claim.—In a non-refillable bottle, or such like, the combination with the neck provided with a valve-seat, and a valve, having a stem, operating upon said seat, of a cage secured at its inner portion within and to the neck and open at its inner and closed at its outer end, and having an open space about its unsecured portion and there provided with ports leading therefrom to the inside of the cage, and an inner tube open at both of its ends and secured to the cage opposite to said ports with an open space about it and between its open outer end and the closed end of the cage.

813,805. **APPAREL-CORSET.** DANIEL KORN, New York, N. Y. Filed Oct. 30, 1905. Serial No. 285,213.



Claim.—1. The combination with the halves of an apparel-corset of ordinary construction, of shaping-supports of flexible material, each formed of a multiplicity of pieces, at one end connected by sewing to the upper edge of the corset from a short distance from the front steels, and extending around toward the under-arm sides and with their free ends overlapped and converging and connected together, and means for connecting their free ends in an adjustable relation.

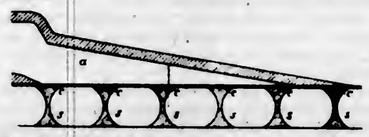
2. The combination with the halves of an apparel-corset of ordinary construction, of shaping-supports of flexible material, each formed of a multiplicity of pieces, at one end connected by sewing to the upper edge of the corset from a short distance from the front

steels, and extending around the under-arm sides and with their free ends overlapped and converging, and connected together, and tying-tapes formed as prolongations of the free converging ends of the shaping-supports, and by which the shaping-supports are tied together for use in an adjustable relation.

3. The combination with the halves of an apparel-corset of ordinary construction, of shaping-supports of flexible material, each formed of a multiplicity of pieces, at one end connected by sewing to the upper edge of the corset from a short distance from the front steels, and extending around toward the under-arm sides and with their free ends converging, and connected together, and means for connecting their free ends in an adjustable relation.

4. The combination with the halves of an apparel-corset of ordinary construction, having a binding along its upper edge of shaping-supports of flexible material, each formed of a multiplicity of pieces, at one end connected together by a binding and sewed thereto, and connected by sewing to the bound upper edge of the corset from a short distance from the front steels, and extending around toward the under-arm sides, and with their free ends converging and connected together, and means for connecting together the free ends of said shaping-supports as extending toward one another over the bust and in an adjustable relation.

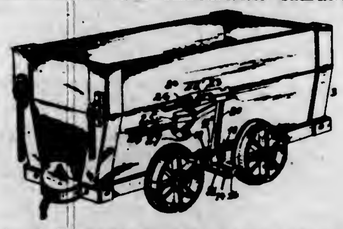
813,806. **NOZZLE FOR TURBINE-ENGINES.** HUGO LENTZ, Berlin, Germany. Original application filed Apr. 4, 1905, Serial No. 253,783. Divided and this application filed Oct. 17, 1905. Serial No. 283,091.



Claim.—1. In a turbine-engine, a turbine running-wheel provided with paddles, and a nozzle for delivering pressure medium thereto, said nozzle consisting of successive narrowing and broadening parts, one wall of the broadening part having an opening which runs back to the point of connection of the narrowing and broadening parts, and which opening is closed by the paddles of the running-wheel.

2. In a turbine-engine, a turbine running-wheel provided with paddles, and a nozzle for delivering pressure medium thereto, said nozzle consisting of successive narrowing and broadening parts, the said broadening part having top and side walls running forward from the point of connection of the narrowing and broadening parts, the bottom wall being entirely cut away forwardly from said point of connection, the opening thus formed being closed by the paddles of the running-wheel.

813,807. **DOOR-ACTUATING MECHANISM FOR CARS.** JOHN LEVAL, Lemont Furnace, Pa. Filed Oct. 5, 1905. Serial No. 281,513.

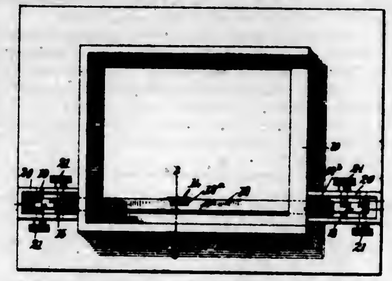


Claim.—1. The combination with a car-body having an opening formed in its bottom, of doors slidably mounted adjacent to said opening and adapted to close said opening, bell-crank levers connected to said car and to said doors, toothed sectors carried by said levers, a rack slidably mounted upon said car and engaging said toothed sectors, a lever pivotally mounted upon said car and when rocked adapted to actuate said rack, a spring-pressed pivotally-mounted retaining-arm carried by the side of said car and adapted to engage the upper end of said lever, substantially as described.

2. The combination with a car having an opening formed in its bottom, of doors slidably mounted upon the bottom of said car, and adapted to close said opening, a rack slidably mounted upon said car, a lever adapted to actuate said rack, means actuated by the movement of said rack to open and close said doors, means to lock said lever in a fixed position, substantially as described.

3. The combination with a car having sliding doors, of a lever pivotally connected to the side of said car, levers pivotally mounted on the bottom of the car and connected to said doors and actuated through the medium of said lever to open and close said doors, and means to lock said first-named lever in a fixed position, substantially as described.

813,808. **CAMERA ATTACHMENT.** MILTON I. LORTSA, Spokane, Wash. Filed Aug. 30, 1905. Serial No. 276,449.



Claim.—1. A camera attachment having a plurality of transparent tapes capable of relative adjustment, for the purpose specified, the said tapes having characters thereon adapted to be exposed to the photographic plate in the camera.

2. A camera attachment having a plurality of relatively adjustable transparent tapes, each having two sets of characters thereon, and a means in which said tapes are guided and inclosed, said means having two openings respectively adapted to expose the sets of characters on the tapes.

3. A camera attachment having a plurality of relatively adjustable transparent tapes, each having two sets of characters thereon, a means in which said tapes are guided and inclosed, said means having two openings respectively adapted to expose the sets of characters on the tapes, and a shutter device for the said openings.

4. A camera attachment having a plurality of relatively adjustable transparent tapes, each having two sets of characters thereon, a means in which said tapes are guided and inclosed, said means having two openings respectively adapted to expose the sets of characters on the tapes, and a shutter-tape movable in said means for inclosing the first-mentioned tapes, the shutter-tape having opaque portions adapted to close said openings.

5. A camera attachment having a flattened tube extending across the rear of the camera, in front of the plate, said tube having an opening therein, and a transparent tape having characters thereon, the tape being inclosed in the tube, and the opening serving to expose one or more of the characters.

6. A camera attachment having a flattened tube extending across the rear of the camera in front of the plate, and a plurality of transparent tapes movable through the tube, said tube having an opening therein, and the tapes having characters thereon adapted to be exposed through the opening.

7. A camera attachment having a flattened tube extending across the rear of the camera in front of the plate, a plurality of transparent tapes movable through the tube, said tube having an opening therein, and the tapes having characters thereon adapted to be exposed through the opening, and a shutter-tape adjustable in the tube and having an opaque portion adapted to be moved opposite the opening in the tube, for the purpose specified.

8. A camera attachment having a tube extending across the rear of the camera in front of the plate position, said tube having an opening opposite the plate position and an opening at one end portion, and the openings being out of longitudinal alinement with each other, and relatively adjustable transparent tapes located in the tube and each having two sets of numbers thereon, which sets of numbers are respectively visible through the openings in the tube.

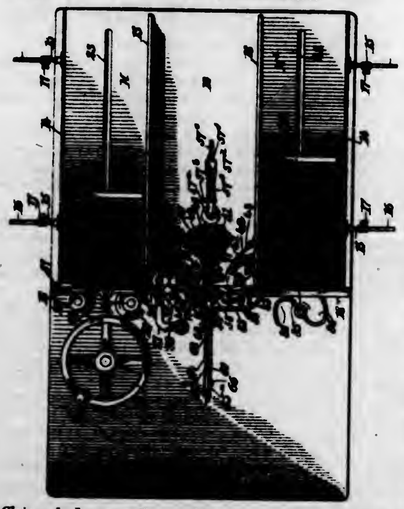
9. A camera attachment comprising a tube extending across the rear of the camera in front of the plate position, and formed with an opening therein opposite the plate position and a second opening in one end portion of the tube, and a tape adjustable in the tube and having two sets of numbers thereon, the openings in the tube being out of longitudinal alinement and serving respectively to expose the sets of numbers on the tape.

10. A camera attachment comprising a tube extending across the rear of the camera in front of the plate position, and formed with an opening therein opposite the plate position and a second opening in one end portion of the tube, a tape adjustable in the tube and having two sets of numbers thereon, the openings in the tube being out of longitudinal alinement and serving respectively to expose the sets of numbers on the tape, and a shutter-tape adjustable in the tube and having opaque portions adapted to cover said openings therein.

11. A camera attachment having a tube extending across the rear of the camera in front of the plate position, said tube having an opening therein opposite the plate position, transparent tapes having numbers thereon adapted to slide in the tube, and rolls located at the ends of the tube and having said tapes wound thereon.

12. A camera attachment having a tube extending across the rear of the camera in front of the plate position, said tube having an opening therein opposite the plate position, transparent tapes having numbers thereon adapted to slide in the tube, rolls located at the ends of the tube and having said tapes wound thereon, a box inclosing the rolls at one end of the tube, a member sliding in one wall of the box, and a shutter-tape adjustable in the tube and connected with said sliding member.

813,809. CANCELING-MACHINE. William G. Maynard, Rondout, N. Y. Filed Oct. 13, 1904. Serial No. 228,360.



Claim.—1. In a canceling-machine, the combination with a die, of an impression member, rolls between which the matter to be canceled passes, one of the rolls being movable from its companion roll by the matter to be canceled, a lever controlled by said movable roll, a cam, a rod coacting with the cam and connected with the impression member, and a link connecting the lever and rod.

2. In a canceling-machine, the combination with a die, of an impression member, rolls between which the matter to be canceled passes, one of the rolls being movable from its companion roll by the matter to be canceled, a lever controlled by the said movable roll, a cam, a rod coacting with the cam and adjustably connected with the impression member, and a link connecting the lever and rod.

3. In a canceling-machine, the combination with a die, of an impression member, a guide-roll having a groove, a controlling member movable in the groove, and operating mechanism connected with the controlling member and with the impression member.

4. In a canceling-machine, the combination with a die, of an impression member, a guide-roll having a groove, a lever provided with a roll coacting with the groove, and operating mechanism connected with the lever and with the impression member.

5. In a canceling-machine, the combination with feed-rolls and canceling mechanism including an impression-roll, of a pivoted and spring-pressed bar, a gate consisting of a plurality of fingers projecting from the end of the bar adjacent to the impression-roll and on the delivery side, and an eccentric rotatable with the feed-rolls and engaging said bar.

6. In a canceling-machine, the combination with a canceling mechanism, of feed-rolls for feeding the articles to the canceling mechanism, feed-rolls for feeding the articles from the canceling mechanism, one of the last-named rolls being provided with an eccentric, a pivoted and spring-pressed bar engaged by the eccentric, and a gate carried by the bar and arranged between the canceling mechanism and the rolls which feed the articles to the canceling mechanism.

7. In a canceling-machine, the combination with a supply-holder and a receiving-holder spaced apart, and a canceling mechanism between the holders, of feed and guide rolls, a support for sundry of the guide and feed rolls, said support being pivotally mounted upon the said holders.

8. In a canceling-machine, the combination with a supply-holder and a receiving-holder spaced apart, and a canceling mechanism between the holders, of feed and guide rolls, a support for sundry of said rolls, links pivotally connecting the support with the holders, and springs engaging the links.

9. In a canceling-machine, the combination of a movable support, and feed and guide rolls mounted in said support, a canceling mechanism, and means carried by the canceling mechanism for engaging the support, whereby the said rolls will be made to contact with their companion rolls with increased pressure.

10. In a canceling-machine, the combination of a yieldingly-mounted support having a projection, feed and guide rolls mounted in the support, a canceling mechanism, and means carried by the die of the canceling-mechanism for engaging the projection of the support, for forcing the said rolls into engagement with their companion rolls for the purpose set forth.

11. In a canceling-machine, the combination with canceling mechanism, of coacting feed-rolls, means for forcing the feed-rolls toward one another, and means for intermittently increasing the pressure.

12. In a canceling-machine, the combination with canceling mechanism, of coacting feed-rolls, means for forcing the feed-rolls toward one another, and means carried by the canceling mechanism for intermittently increasing the pressure.

13. In a canceling-machine, the combination with a movable die, of coacting feed-rolls, and a revoluble spring movable with the die and coöperating with the feed-rolls.

14. In a canceling-machine, the combination with a movable die, of coacting feed-rolls, a revoluble spring movable with the die and coöperating with the feed-rolls, and means for adjusting the position of the spring upon the die.

15. In a canceling-machine, the combination of feed-rolls, a movable spring-pressed support for one of the feed-rolls, a movable die, and a spring carried by the die and adapted to engage the movable support of the feed-roll.

16. In a canceling-machine, the combination with a die, of a yieldingly-mounted support, an impression-roll carried by the support, means for operating the die, a cam operated by the die-operating means, and a rod pivotally connected with the said support and provided with a projection engaging the cam.

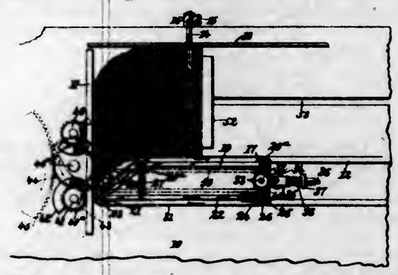
17. In a canceling-machine, the combination with a die, of a yieldingly-mounted support, an impression-roll carried by the support, means for operating the die, a cam operated by the die-operating means, a rod pivotally connected with the support and provided with a projection for engaging the cam, the projection of the rod being normally out of engagement with the cam, and means controlled by the matter to be canceled for operating the rod to bring its projection into engagement with the cam.

18. In a canceling-machine, the combination of a die, a spring-pressed frame, an impression-roll carried by the frame, an arm loosely connected with the frame, a rod pivoted to the arm and provided with a roller at its free end, a cam with which the roller of the arm engages, a lever movable by the matter to be canceled, and a connection between the free end of the lever and the rod.

19. In a canceling-machine, the combination of a die, an impression member mounted in a movable support, rolls between which the matter to be canceled passes, one of the rolls being movable from its companion roll, a lever operated by said movable roll, a cam operated by the die-operating means, a rod having one end pivotally connected with the support of the impression member and provided at the other end with a projection for engaging the cam, and a link connecting the said lever and rod.

20. In a canceling-machine, the combination of a die, means for operating the die, a spring-pressed frame, an impression-roll carried by the frame, an arm loosely connected with the frame, a rod pivoted to the arm and provided with a roller at its free end, a cam operated by the operating means and with which the projection of the rod engages, rolls between which the matter to be canceled passes, one of the rolls being movable from its companion roll, a lever operated by the movable roll, and a link connecting the lever and rod.

813,810. FEEDER. William G. Maynard, Rondout, N. Y. Filed May 22, 1905. Serial No. 261,809.



Claim.—1. A feeder, comprising a holder having an adjustable side wall, an endless belt mounted in the holder opposite the adjustable wall and forming a side wall of the holder and with the end wall of the said holder a feed-throat, and means for feeding objects through said throat.

2. A feeder, comprising a holder having one side wall terminating short of the end wall, an endless belt arranged in the space between the side and end wall and forming a continuation of said side wall and with the end wall of the holder a feed-throat, means for feeding objects through said throat, and means for imparting movement to the belt in a direction reverse of that of the objects fed from the holder.

3. A feeder comprising a holder having a side and end wall between which is a space, an endless belt arranged in said space and forming a continuation of said side wall, means for moving the belt rearwardly from the end wall, and means for feeding objects through the space.

4. A feeder comprising a holder having a side and end wall between which is a space, an endless belt extending from the side wall toward the end wall and having its inner face inclined at an angle to said walls, the inclined end of the belt being yieldingly mounted, and means for feeding objects through the space.

5. In a feeder, the combination with a holder having an end wall and an endless belt furnishing a side wall and separated from the end wall by a space, the end of the belt adjacent to the end wall being yieldingly mounted of means for feeding objects through the space.

6. In a feeder, the combination with a holder having an end wall and an endless member furnishing a side wall and separated from the end wall by a space, of means for intermittently moving the member, and means for feeding objects through the space.

7. In a feeder, the combination with a holder having an end wall and an endless belt furnishing a side wall and separated from the end wall by a space, the end of the belt adjacent to the end wall being inclined at an angle thereto, of means for yieldingly mounting the said inclined end of the belt, and means for feeding objects through the space.

8. A feeder comprising a base, a wall rising from the base, a feeding member situated adjacent to the wall, journals projecting from the base, rolls rotatable upon the journals, one of the rolls being bodily movable, and a belt operating over the rolls.

9. A feeder comprising a base, a wall rising from the base, a feeding member situated adjacent to the wall, journals projecting from the base, rolls rotatable upon the journals, an arm swinging upon a journal and extending toward the wall, a roll rotatable upon the arm, and a belt operating over the rolls.

10. A feeder comprising a base, a wall rising from the base, a feeding member situated adjacent to the wall, journals projecting from the base, rolls rotatable upon the journals, an arm swinging upon a journal and extending toward the wall, a roll rotatable upon the arm, a spring exerting its tension upon the arm, and a belt operating over the rolls.

11. A feeder comprising a base, a wall rising from the base, a feeding member situated adjacent to the wall, journals projecting from the base, rolls rotatable upon the journals, an arm swinging upon a journal and extending toward the wall, a second arm pivoted upon that first named, rolls rotatable upon the arms, and a belt operating over the rolls.

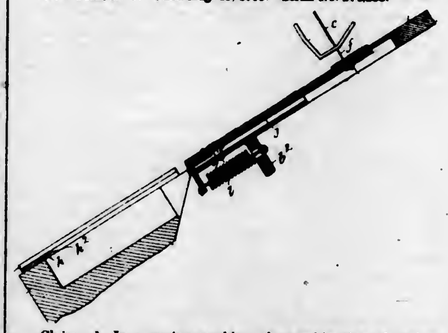
12. A feeder comprising a base, a wall rising from the base, a feeding member situated adjacent to the wall, journals projecting from the base, rolls rotatable upon the journals, an arm swinging upon a journal and extending toward the wall, a second arm pivoted upon that first named, rolls rotatable upon the arms, one of said rolls being bodily movable independently of the arms, and a belt operating over the rolls.

13. In a feeder, the combination of a holder, an endless belt forming one side of the holder and with a wall of the holder a feed-throat, means for feeding objects through the throat, and means for imparting movement to the belt in a direction the reverse of that of the objects fed from the holder.

14. In a feeder, the combination of a holder, an endless belt forming one side of the holder and with a wall of the holder a feed-throat, means for feeding objects through the throat, and means for imparting an intermittent traveling movement to the belt in a direction the reverse of that of the objects fed from the holder.

15. In a feeder, the combination of a holder, an endless belt having one end yieldingly mounted and forming one side of the holder and with a wall thereof a feed-throat, means for feeding objects through the throat, and means imparting movement to the belt in a direction the reverse of that of the objects fed from the holder.

813,811. THREAD-CUTTER FOR SEWING-MACHINES. Sophie Mendel, New York, N. Y., assignor to Benjamin Edmund David, New York, N. Y. Filed Aug. 15, 1905. Serial No. 274,258.



Claim.—1. In a sewing-machine, the combination of a plate having a groove, with a sharpened slotted post projecting into the groove, and a slidable hook engaging the post, substantially as specified.

2. In a sewing-machine, the combination of a plate having a groove, with a sharpened slotted post projecting into the groove, a slide, and a hook secured thereto and embraced by the post, substantially as specified.

813,812. LAST-THIMBLE. Ephraim S. Morton, Brockton, Mass. Filed Dec. 9, 1904. Serial No. 236,174.

Claim.—1. A socket-thimble for lasts comprising a tubular member adapted to be inserted in the spindle-socket of a last and formed with locking projections on its inner end, and a transverse piece having a flat upper surface and inclined sides engaged with said locking projections.

2. A socket-thimble for lasts comprising an open-ended lining-piece formed with tapered openings in opposite sides adjacent one end thereof, the sides of said openings constituting locking projections, and an end piece consisting of a flat-sided bar adapted to be inserted in said openings and engaged by the locking projections.

3. A socket-thimble for lasts comprising an open-ended tube adapted to be inserted in the spindle-socket of a last and formed with openings diametrically opposite each other in the side walls adjacent one end, and a bottom piece having a flat upper surface and inclined sides extended through the said openings.

4. A last having a spindle-socket, a tubular thimble inserted therein having an open bottom end and notches with inclined sides formed in diametrically opposite sides of the thimble at its end, the inclined sides of the notches constituting locking projections extending toward each other, and a bar having a flat upper surface and sides inclined to correspond to the inclination of the sides of the notches inserted into a transverse hole in the last and said notches, its sides engaging the locking projections and its ends extending beyond the sides of the thimble and engaging the wood of the last to lock the thimble in place.

5. A last having a spindle-socket, a tubular open-ended thimble inserted therein having dovetail-shaped notches in diametrically opposite sides at its bottom end, the openings of the notches at the end of the thimble being of less width than the interior of the notches, and a bar inserted in a transverse opening in the last intersecting the spindle, the bar having a flat upper surface and inclined sides, its shape in section corresponding to the shape of the notches, the bar being extended through the notches with its sides engaging the sides thereof and its ends projecting beyond the sides of the thimble in engagement with the wood of the last, whereby the bar constitutes a lock for holding the thimble in the last and an abutment for receiving the pressure of the jack-spindle.

6. In a last, a socket-thimble provided with a locking portion, and a socket bottom and thimble locking piece consisting of a bar having a flat upper surface and a segmental lower portion adapted to extend across the heel portion of a last and interlock with said locking portion of the socket-thimble.

7. In a last, a socket-thimble provided with a locking portion, and a socket bottom and thimble locking piece consisting of a bar having a flat upper surface and a segmental lower portion adapted to extend across the heel portion of a last and interlock with said locking portion of the socket-thimble, and being provided in its under part with serrations forming teeth.

813,813. **MUCILAGE-BOTTLE.** FREDERICK M. MUNROE, Brooklyn, N. Y. Filed Mar. 1, 1905. Serial No. 247,907.

Claim.—1. In a mucilage bottle or holder, the combination with a bibulous or absorbent cushion, and a cage for the cushion, of a mucilage-reservoir located below the cushion, said cushion extending into said reservoir and protruding above the same, and a neck or well extending above the cushion so that the cushion supports the brush in said neck or well and feeds the mucilage to the brush by capillary attraction without excess or flooding, substantially as described.

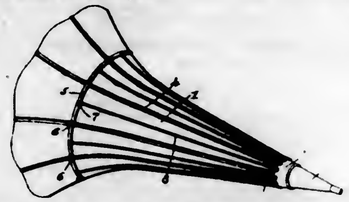
2. In a mucilage bottle or holder, the combination with a bibulous or absorbent cushion and a cage for the cushion, of a mucilage-reservoir located below said cushion, said cushion extending into said reservoir and protruding above the same, a neck or well extending above said cushion, and a vertically-movable brush and closure projecting into said neck or well and supported on said cushion, whereby the mucilage is fed to the brush by capillary attraction without flooding or excess and whereby the amount of mucilage taken up by the brush can be regulated without the necessity of wiping off any excess, substantially as described.

3. In a mucilage bottle or holder, a mucilage-reservoir, a cushion of bibulous or absorbent material, a perforated cage in which said cushion is held, a neck or well which extends above the said cushion and an offset attached to said cage to support it in the reservoir, substantially as described.

4. In a mucilage bottle or holder, a neck, a closure having a hemispherical lower surface and adapted to move up and down and wabble in said neck and a brush and handle held by said closure, substantially as described.

813,814. **FOLDING PHONOGRAPHIC HORN.** MARTIN L. MUNSON, New York, N. Y. Filed July 13, 1905. Serial No. 269,466.

Claim.—1. A horn of the class described, having a collapsible body, a plurality of stays attached to said body and extending longitudinally thereof, and jointed links connecting said stays and adapted to maintain the same apart



2. A horn of the class described, having a collapsible body and a mouthpiece attached thereto, a metallic frame attached to said mouthpiece and to said body, said frame comprising jointed links, a collar slidably mounted on said mouthpiece, and rods connecting said links with said collar for actuating said frame.

3. A horn of the class described, having a mouthpiece and a collapsible body, an extensible ring adapted to open said body and means for actuating said ring from a point near said mouthpiece.

4. A horn of the class described, having a mouthpiece and an expansible body, a plurality of links jointed together and pivotally supported on said body to expand the same.

5. A horn of the class described, having a collapsible body, jointed links attached to said body and forming an extensible ring, a mouthpiece attached to said body, a sliding collar on said mouthpiece and pull-rods connecting said collar with said links.

813,815. **ROTARY ENGINE.** ROSS S. MCINTOSH, Buffalo, N. Y., assignor to Liberty Manufacturing Company, Pittsburg, Pa. Filed Nov. 5, 1902. Serial No. 130,143.

Claim.—1. The combination of a casing provided with a longitudinal concentric piston chamber or bore, an inlet-passage for said chamber extending longitudinally thereof and communicating therewith by ports, an exhaust-passage also extending longitudinally of said chamber and communicating therewith, a cylindrical part fixed concentrically in said piston-chamber, and journaled at its ends, and a series of blades loosely arranged in longitudinal radial slots of said piston, said blades bearing at one edge against the fixed cylindrical part, and at the opposite edge against the wall of said chamber; substantially as described.

2. In a rotary engine, a cylinder or casing having therein a longitudinal, eccentric piston-chamber, longitudinally-extending inlet and exhaust passages in the wall of said chamber, and communicating therewith, one end of said chamber being closed by a transverse partition-wall around which the inlet-port extends, and which forms a seat for a piston-bearing, and a piston in said chamber; substantially as described.

3. In a rotary engine, a casing having a longitudinal piston-chamber therein open at one end and closed at the other by a partition-wall, a cap-ring closing the other end of the chamber around the piston, said ring having an exhaust-port therein communicating with longitudinal exhaust-passages in the wall of said chamber, and a piston in said chamber; substantially as described.

4. The combination of a casing provided with a piston-chamber, an inlet-passage communicating with said chamber and extending to one end of said casing, and an exhaust-passage communicating with said chamber and extending to the other end of said casing, a cylindrical part arranged concentrically in said piston-chamber and fixed at one end to one end of said casing, a tubular piston surrounding said fixed part, arranged eccentrically in said piston-chamber, and journaled at one end on said fixed part and at its other end on said casing, a shaft secured to one end of said piston, and blades loosely arranged in longitudinal slots in said tubular piston and bearing at their outer edges against the wall of said piston-chamber, and at their inner edges against said fixed cylindrical part, substantially as set forth.

813,816. **FENCE-POST.** JOHN C. MCVEY, Kansas City, Mo. Filed Dec. 7, 1903. Serial No. 183,743.

Claim.—1. The combination with a cementitious fence-post having a longitudinal groove in one side, the groove being dovetail shape, of a plurality of metal fence-wire-engaging devices longitudinally adjustable in said groove, each of said devices being formed of sheet metal fitting said groove and provided each with two arms extending beyond the face of the post, said arms having each in one edge beyond the face of the post a notch adapted to receive therein the fence-wire, said arms being foldable toward each other and foldable inwardly across the fence-wire embraced thereby.

2. The combination with a cementitious fence-post having in one side a longitudinal groove of dovetail shape, said groove having two longitudinal recesses disposed respectively where the side walls intersect the rear wall of the groove, of a plurality of fence-wire-engaging devices mounted in said groove, each of said devices being composed of sheet metal and provided each with a forwardly-curved rear portion adapted to be flattened and when flattened entering said recesses respectively, each device having two arms projecting beyond the face of the post, each arm having in one edge a notch adapted to receive the fence-wire, the arms of each device forward of said notches being foldable toward each other and across the fence-wire.

3. The combination with the fence-post having in one side a longitudinal groove of dovetail shape, of a wire-engaging device longitudinally adjustable in said groove and composed of sheet metal fitted to the walls of said groove, said device having two arms projecting beyond the face of the fence-post, each of said arms having in one edge beyond the face of the post a notch adapted to receive therein the fence-wire, said arms being foldable toward each other and rearwardly across the fence-wire.

4. The combination with a fence-post having on one side a dovetail groove disposed longitudinally and having two longitudinal recesses disposed respectively where the side walls intersect the rear wall of the groove, of a wire-engaging device longitudinally adjustable in said groove and composed of sheet metal, said device having a forwardly-curved rear portion adapted to be flattened and when flattened entering said recesses, said device having two arms projecting beyond the face of the post, each arm having in one edge a notch to receive the fence-wire, said arms being foldable toward each other and rearwardly across the fence-wire.

5. The combination with the fence-wire, of the post having a longitudinal dovetail-shape groove, and a wire-engaging device of sheet metal formed to fit said groove and provided with two arms projecting beyond the face of the post, each arm beyond the face of the post having a notch to receive the fence-wire, said arms being foldable toward each other and rearwardly across the fence-wire.

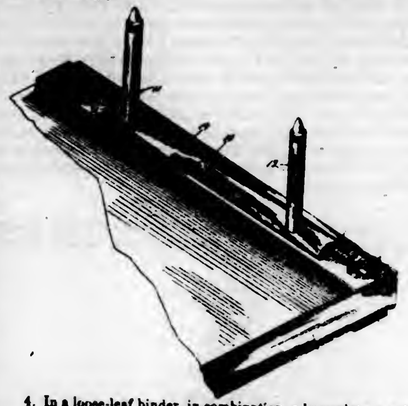
6. The combination with the fence-wires, of the post having a longitudinal dovetail-shape groove, and a plurality of wire-engaging devices longitudinally adjustable in said groove, each device being made of sheet metal formed to fit said groove and provided each with two arms projecting beyond the face of the post, each arm having in one edge a notch to receive the adjacent fence-wire, said arms of each device being foldable toward each other and rearwardly across the fence-wire held in the notches.

813,817. **FILE-BINDER.** CHARLES R. NELSON, Chicago, Ill., assignor to Sieber & Trumbull Manufacturing Company, a Corporation of Missouri. Filed Aug. 1, 1903. Serial No. 167,933.

Claim.—1. In a loose-leaf binder, in combination, a base-plate, a pair of posts set therein, a pressure-plate running on the posts, a binding-plate apertured to fit upon the posts and being in slidable engagement with the pressure-plate, the distance between one of the apertures and the remoter side of the other aperture differing from the distance between the posts correspondingly measured the binding-plate being elastic at one of its apertures.

2. In a loose-leaf binder, in combination, a base-plate, a plurality of posts rising therefrom, a pressure-plate running on the posts, a binding-plate in sliding engagement with the pressure-plate and apertured to fit loosely on the posts and being expansible at one of its apertures and non-expansible at the other aperture, and means for shifting the binding-plate laterally as to the posts.

3. In a loose-leaf binder, in combination, a base-plate, a plurality of posts rising therefrom, a pressure-plate running on the posts, a binding-plate in sliding engagement with the pressure-plate and having an aperture for loosely receiving each post and being expansible at one of its apertures and non-expansible at the other aperture, a block secured to the pressure-plate and having a threaded aperture, and a screw engaging each aperture and in swiveled engagement with the binding-plate.



4. In a loose-leaf binder, in combination, a base-plate, a pair of posts rising therefrom, an apertured pressure-plate running on the posts, a binding-plate slidingly engaging the pressure-plate and apertured to fit loosely on the posts, the centers of its apertures being closer together than the centers of the posts, such last-named plate being split from one end to the adjacent aperture, and means for sliding such plate laterally as to the posts.

5. In a loose-leaf binder, in combination, a base-plate, a pair of posts set therein, a pressure-plate running on the posts, a binding-plate apertured to fit upon the posts and being in slidable engagement with the pressure-plate, one of the apertures in the binding-plate being of less width at one end than the diameter of the post with which it coöperates and the plate being resiliently expansible at such aperture, and means for adjustably shifting the binding-plate in one direction to engage it with both posts.

813,818. **BINDER-FILE.** CHARLES R. NELSON, Chicago, Ill., assignor to Sieber & Trumbull Manufacturing Company, a Corporation of Missouri. Filed July 21, 1905. Serial No. 270,622.

Claim.—1. In a binder, in combination, a base-plate; a pair of posts rising therefrom; a binding-plate slidable upon one of the posts when transverse to a line through the posts, and adapted to positively engage both posts when in alinement therewith.

2. In a binder-file, in combination, a base-plate; a pair of posts rising therefrom; and a flexible binding-plate for engaging the posts normally fixed in position but vertically movable on one of the posts when flexed and on the other post only when turned at an angle from its normal position.

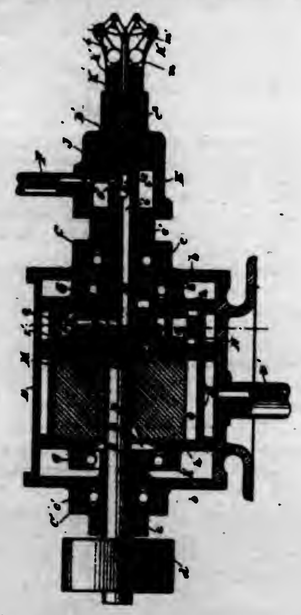
3. In a binder, in combination, a base-plate; a pair of posts rising therefrom and having lateral notches; a spring-plate apertured to receive the posts and adapted to run on one thereof, only when transverse to a line uniting the posts, the aperture for receiving the other post being prolonged at less than the major diameter of the post, the spacing of the apertures and the posts being different.

4. In a binder, in combination, a base-plate; a pair of posts rising therefrom, one of the posts being flattened and having lateral

notches, the greater diameter of each post being in a direction transverse to a line through the posts; and a binding-plate having, adjacent one of its ends, an aperture elongated longitudinally as to the plate for receiving the flattened post and of sufficient width to receive its contracted portion by engaging the post-notch, the opposite end of the binding-plate being adapted to positively engage the other post.

5. In a binder-die, in combination, base-plate; a pair of posts rising therefrom and having lateral notches, one of the posts being flattened and having its greater diameter in a direction transverse to a line between the posts; and a spring binding-plate for engaging the posts having, adjacent one of its ends, an aperture elongated longitudinally as to the plate for receiving the flattened post and of sufficient width to receive its contracted portion by engaging the post-notch, and adjacent its opposite end an aperture for receiving the other post and prolonged by a slot of less width than the diameter of such posts, the distance between the apertures being different from that between the posts.

813,819. MULTIPLE-EXPANSION ROTARY ENGINE. ALFRED I. OSTRANDER, Yonkers, N. Y. Filed May 27, 1905. Serial No. 262,542.



Claim.—1. In an engine, a cylinder, an eccentric piston, means for admitting fluid through said piston, and a hollow piston-shoe having arcuate faces in engagement with said piston.

2. In an engine, a rotary eccentric piston, and a radially-movable piston-shoe provided with curved bearing-surfaces which engage with, and are adapted to turn in, said piston.

3. In an engine, a cylinder, an eccentric revoluble piston carried by a shaft, a chambered piston-shoe having a radial sliding movement relative to said piston, and means for supplying motive fluid to said piston-shoe.

4. In an engine, a cylinder, an eccentric piston therein, a passage for motive fluid in said piston, and a hollow shoe fitted in said piston for radial and rocking movement therein, said shoe being adapted to lie across said passage in the piston.

5. In an engine, a cylinder, an eccentric revoluble piston carried by a shaft, a chambered piston-shoe seated in the piston to have a radial movement and a rocking movement therein, said shoe in one position being adapted to cut off the passage of motive fluid back of the same, and means for supplying a motive fluid to the chambered shoe.

6. In an engine, a cylinder, an eccentric revoluble piston carried by a shaft, a piston-shoe, one face of which is of the same radius as the cylinder and having an arcuate face or faces of a different radius, whereby the shoe is adapted to have a radial movement and a rocking play relative to the piston, and means for supplying a motive fluid to the shoe.

7. In an engine, a cylinder, a rotary eccentric piston therein, said piston having a pocket or chamber in its periphery, a passage for motive fluid in communication with said pocket or chamber, and a hollow piston-shoe occupying said pocket or chamber and adapted to turn and to slide therein.

8. In an engine, a cylinder, an eccentric revoluble piston carried by a shaft, a chambered piston-shoe having a plurality of arcuate faces and a port in one of said faces, said port being adapted to register with a port in the piston, and means for supplying motive fluid to the shoe.

9. In an engine, a piston, a piston-shoe seated in said piston on one side thereof, and a counterpoise carried by the piston on the other side.

10. In an engine, a cylinder, a piston, a piston-shoe seated in said piston on one side thereof, and a counterpoise seated in the piston on the other side, the shoe and the counterpoise being held in contact with a cylinder under centrifugal energy and movable relative to said piston.

11. In an engine, a cylinder, a piston, a piston-shoe seated in said piston on one side thereof, and a counterpoise seated in the piston on the other side, said counterpoise having traveling contact with a cylinder and arranged to permit passage of fluid within the same.

12. In an engine, a piston having pockets at opposite points, a piston-shoe in one of said pockets, and an annular counterpoise movable freely in the other pocket.

13. In an engine, a working cylinder divided into piston-chambers, a piston having members adapted to operate in said chambers, passages in the members of the piston for supplying motive fluid directly to one of the chambers and for exhausting the motive fluid into other piston-chambers, and a plurality of piston-shoes seated on the respective members of the piston for operation in the piston-chambers, each piston-shoe being arranged across one of said passages in a piston member.

14. In an engine, a working cylinder divided into piston-chambers, a piston having members adapted to operate in said chambers, passages in the members of the piston for supplying motive fluid directly to one of the chambers and for exhausting the motive fluid into other piston-chambers, and a plurality of chambered piston-shoes, one of said shoes being in one of said piston-chambers and each shoe extending across one of said passages; one of the passages and the complemental shoe in one piston member being in a different plane lengthwise of the piston from another passage and the shoe in the next piston-chamber.

15. In an engine, a working cylinder divided into piston-chambers, a piston having members adapted to operate in said chambers, passages in the piston, one of said passages opening into a high-pressure chamber, another passage extending between the adjacent chambers, and each of said passages being free and unobstructed in the body of the piston, and a plurality of piston-shoes seated in the members of the piston, each of said shoes being across the outlet of one passage where the latter discharges into one of the piston-chambers.

16. In an engine, a plurality of pressure-chambers, a piston-shaft, a plurality of piston members on said shaft and adapted to operate in the respective chambers, unobstructed fluid-passages in the body of the piston members whereby communication is established between the chambers and with a source of supply, and a plurality of hollow shoes seated on the respective piston members and each arranged across one of said passages, a single shoe being in each of the pressure-chambers.

17. In an engine, a plurality of pressure-chambers, a piston having members adapted to operate in said chambers, fluid-passages in the piston members, and a plurality of piston-shoes seated in the respective piston members and each disposed across the outlet end of one of the passages, each piston-shoe engaging with one piston member for axial and slidable movement relative thereto.

18. In an engine, a plurality of pressure-chambers, a single shaft, a piston having members adapted to operate in the chambers, a plurality of piston-shoes on the respective members of the piston, each shoe being capable of a radial movement and a rocking movement, means for supplying motive fluid to one shoe, and a passage in the piston leading from one chamber to the other piston-shoe.

19. In an engine, a plurality of pressure-chambers, a single shaft, a piston having members adapted to operate in the chambers, a plurality of piston-shoes seated on the piston members and arranged in different radial positions relative to each other, a plurality of counterpoises seated in the piston members opposite to the piston-shoes therein, and means for supplying a motive fluid to the chambers through said shoes.

20. In an engine, a piston-shaft, a pressure-chest, a live inlet to said pressure-chest, a cut-off adapted to rotate with the piston-shaft and to slide across the live inlet to the pressure-chest, and a governor operatively connected to the cut-off for giving the slidable movement thereto.

21. In an engine, a piston-shaft, a pressure-chest, a live inlet to said chest, a cut-off having a spiral operating-face, said cut-off being revoluble with the shaft and also adapted to slide thereon for moving the spiral face across the live inlet, and a governor operatively connected with the cut-off for imparting the sliding movement thereto.

22. In an engine, a cylinder, a piston rotating on an axis different from that of the cylinder, and a piston-shoe seated on said piston, said shoe having a plurality of arcuate faces, one of which is normally in engagement with the cylinder, other arcuate faces of said shoe being in engagement with the piston to have rocking play relative to the piston.

23. In an engine, a cylinder, a rotary piston, a fluid-passage therein, and a piston-shoe seated in the piston across the outlet from the passage thereof, said shoe having a plurality of arcuate faces, one of which is adapted for engagement with the cylinder and the other faces engaging with the piston to enable the shoe to turn axially therein.

24. In an engine, a piston-shaft having means for the admission of a motive fluid, a pressure-chest, a cut-off slidable relative to an inlet-port to said pressure-chest, for regulating the area of said port, a governor on the piston-shaft, and a stem slidable in the piston-shaft and connecting the governor with said cut-off.

25. In an engine, a piston-shaft having a longitudinal passage and an inlet-port, a pressure-chest, a cut-off revoluble with said shaft, and slidable relative to an inlet-port of said chest, a governor in coaxial relation to the piston-shaft and carried thereby, and a stem slidable in the piston-shaft and operatively connecting the cut-off with said governor.

26. In an engine, a casing provided at its ends with a set of externally-located bearings, a piston-shaft journaled in said bearings, bearing-sleeves rigid with the casing and located internally thereof, a revoluble cylinder provided at its ends with hollow journals which surround the bearing-sleeves, bearings engaging with the hollow journals and the bearing-sleeves, and a piston on the shaft.

27. In an engine, a piston having a pocket and a fluid-passage, and a piston-shoe seated in said pocket of the piston for axial movement relative thereto and disposed across the passage, said shoe being of greater width than the depth of the pocket.

813,820. PAPER-MACHINE. JAMES W. PACKER, Glens Falls, N. Y., assignor to The Sandy Hill Iron and Brass Works, a Corporation of New York. Filed Aug. 31, 1905. Serial No. 276,490.

Claim.—1. A shake-frame for machines of the class described consisting of two side bars and one end bar movably connected together, the side bars at one end with the ends of the end bar, respectively, the side bars being provided on their upper sides with bearings for the breast-roll opening upwardly and located forwardly of the end bar, and rear end hangers located rearwardly of the end bar, the side bars being adapted to be movably supported at their forward ends by a fixed frame, substantially as described.

2. A shake-frame for machines of the class described consisting of two side bars and one end bar movably connected together, the side bars at one end with the ends of the end bar, respectively, the side bars being provided with means for supporting the breast-roll, table-rolls and return-rolls forwardly of the end bar, with rear end hangers located rearwardly of the end bar and with means for supporting the save-alls beneath the table-rolls, and adapted to be movably supported at their forward ends by a fixed frame, substantially as described.

3. In a machine of the class described, the combination with a fixed frame; of a shake-frame consisting of two side bars and one end bar movably connected together, the side bars at one end with the ends of the end bar, respectively, the side bars having rear end hangers located rearwardly of the end bar; breast, table and return rolls supported by the side bars forwardly of the end bar; supporting-standards; pendulous connections between the end hangers and standards, respectively; means for movably supporting the forward end of the shake-frame by the fixed frame; and means for vibrating the rear end of the shake-frame, substantially as described.

4. In a machine of the class described, the combination with a fixed frame; of a shake-frame consisting of two side bars and one end bar connected together by vertical pivots, the side bars at one end with the ends of the end bar respectively, the side bars having end hangers located rearwardly of the end bar; rolls supported by the side bars for carrying the making-wire; supporting-standards located rearwardly of the shake-frame and provided with hangers vertically above the side-bar hangers on the shake-frame; and supporting-links connecting the standard-hangers with the side-bar hangers respectively; means for movably supporting the forward end of the shake-frame by the fixed frame, and means for vibrating the rear end of the shake-frame, substantially as described.

5. In a machine of the class described, the combination with a fixed frame; of a shake-frame consisting of two side bars and one end bar connected together by vertical pivots, the side bars at one end with the ends of the end bar respectively; universal-joint connections between the forward end of the shake-frame and the fixed frame; supporting-standards provided with hangers; pendulous connections between the shake-frame and hangers respectively; means for imparting vertical movements to the standard-hangers; means for securing the standard-hangers in different vertical positions; and means for communicating vibratory movements to the rear end of the shake-frame, substantially as described.

6. In a machine of the class described, the combination with a fixed frame, and supporting-standards; of a shake-frame consisting of two side bars and one end bar movably connected together the side bars at one end with the ends of the end bar, respectively, wholly supported by end connections, the forward end by the fixed frame and the rear end by the supporting-standards; and means for detachably supporting the breast-roll on the upper side of the two side bars intermediately of the end connections of the shake-frame whereby the breast-roll can be moved along the upper side of the side bars forwardly of the end bar in changing the making-wire, such end bar being located intermediately of the end connections of the shake-frame.

7. In a machine of the class described, the combination with a shake-frame having its rear end vertically adjustable and provided with a vertical slideway; of a follower adapted to move vertically in such slideway; and means for imparting approximately horizontal reciprocatory movements to the follower whereby vibratory movements in a horizontal direction may be imparted to the rear end of the shake-frame, substantially as described.

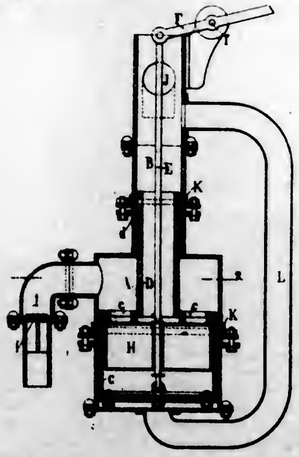
8. In a machine of the class described, the combination with a shake-frame having its rear end vertically adjustable and provided with a vertical slideway formed by adjustably securing a vertical bar to one side of the shake-frame and at a distance therefrom to permit the follower or journal-box to travel vertically between and be guided

by such bar and a guideway on the shake-frame; and means for imparting to the follower approximately horizontal reciprocating movements, substantially as described.

9. In a machine of the class described, the combination of a fixed frame; a shake-frame consisting of two side bars and one end bar connected together by vertical pivots the side bars at one end with the ends of the end bar respectively; standards; hangers vertically adjustable on the standards; pendulous connections between the rear ends of the side bars of the shake-frame and the standard-hangers respectively; universal-joint connections between the forward ends of the side bars of the shake-frame and fixed frame; a vertical slideway on one end of the end bar; a follower movable in such slideway; and means for imparting approximately horizontal reciprocatory movements to the follower, substantially as described.

10. In a machine of the class described, the combination with a fixed frame; a supporting-standard provided with hanger-supports located below the level of the breast-roll, whereby such roll can be moved upwardly and along the upper side of the side bars of the shake-frame when changing the making-wire; of a shake-frame movably connected at its forward end with the fixed frame and provided at the lower part of its rear end with hanger-supports; a pendulous connection between the hanger-supports of the shake-frame and the hanger-supports of the standard; and means for communicating shake movements to the shake-frame, substantially as described.

813,821. BALANCED SUCTION AND FORCE PUMP. PIERRE H. J. PAINDAVOINE and PIERRE A. PAINDAVOINE-DUPOUR, Les Fontenettes à la Chapelle aux Pots, France. Filed Sept. 23, 1904. Serial No. 225,022.



Claim.—1. A pump comprising a cylinder of relatively large diameter, and provided with an upward extension of relatively small diameter, a hollow piston within the cylinder provided with openings in its upper face, an upward extension on the piston for engaging the extension of the cylinder, a bracket on the extension of the cylinder, a handle pivoted to the bracket, a piston-rod connecting the handle with the lower face of the piston, a float-valve in the piston, and provided with an opening to engage the piston-rod, a supply-pipe communicating with the cylinder above the piston, a valve in the supply-pipe, and a tube forming a communication between the extension of the cylinder and the space below the piston.

2. A pump comprising a cylinder, a hollow piston within the cylinder, means for elevating and depressing the cylinder, a float-valve within the piston, a supply-pipe communicating with the cylinder above the piston and means acting on the bottom of the piston to assist in elevating the same.

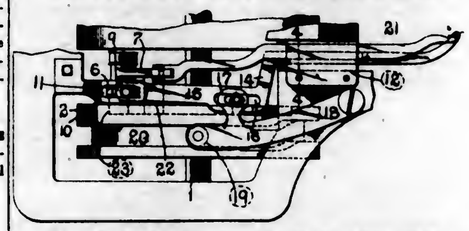
3. A pump comprising a cylinder, a hollow piston within the cylinder, means for elevating and depressing the cylinder, a float-valve within the piston and means for equalizing the pressure on the upper and the lower faces of the cylinder comprising a tube forming a communication between the space above and the space below the piston.

4. A pump comprising a cylinder, a hollow piston within the cylinder, means for elevating and depressing the cylinder, a float-valve within the cylinder, a supply-pipe communicating with the cylinder above the piston, and means whereby the fluid above the piston may communicate with the space below the piston to equalize the pressure on the opposite faces of the piston.

5. A pump comprising a cylinder, a hollow piston within the cylinder, means for elevating and depressing the piston, a float-valve within the piston, a supply-pipe communicating with the cylinder above the piston and independent means acting on the bottom of the piston to assist in elevating the same.

6. A pump comprising a cylinder, a hollow piston within the cylinder, means for elevating and depressing the piston, a float-valve within the piston, a supply-pipe communicating with the cylinder above the piston and independent means acting beneath the piston to assist in elevating the same.

813,822. THREAD-LAYING DEVICE. CHRISTIAN PEDERSEN, St. Louis, Mo., assignor to Landis Machine Company, St. Louis, Mo., a Corporation of Missouri. Filed Aug. 14, 1905. Serial No. 274,114.



Claim.—1. In a thread-laying mechanism for sewing-machines, the combination of an oscillatory lever having a thread-eye at one end; a horizontal movable lever pivoted to the frame of the machine and connected to said first-mentioned lever, a cam for actuating said second-mentioned lever, a rocking lever connected to the frame and to the first-mentioned lever, a cam for actuating the third-mentioned lever and a sliding hooked element coöperating with the first-mentioned lever to lay the thread about the barb of the needle, substantially as described.

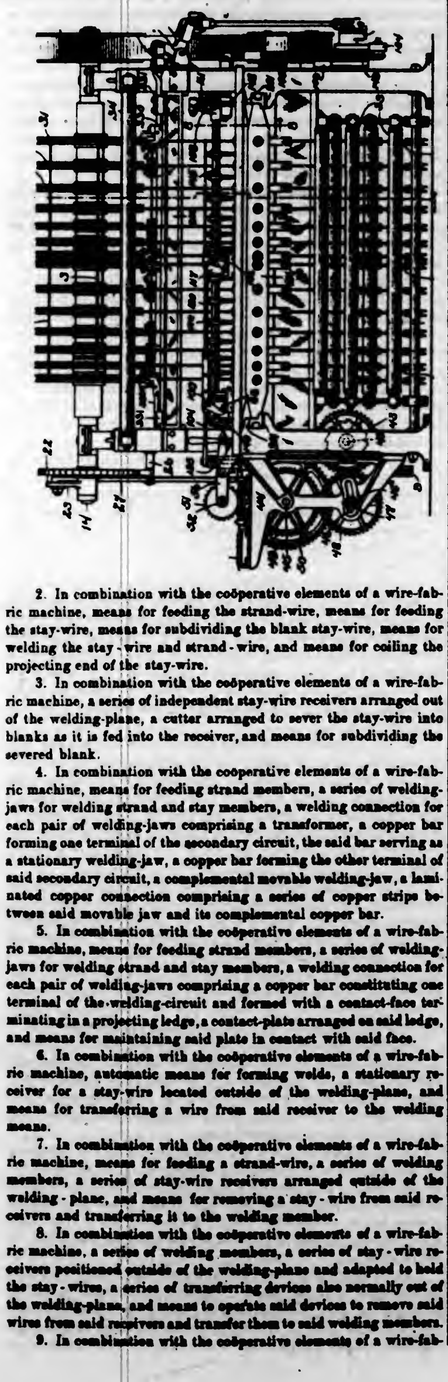
2. In a thread-laying mechanism for sewing-machines, an oscillatory thread-carrying lever, a pivoted element engaging said lever, a cam in engagement with said pivoted element and having a relatively straight groove, an offset groove the wall of which is offset slightly beyond the side wall of the straight groove and another offset groove the wall of which is offset slightly beyond the opposite side of said groove, and means for imparting a movement to said lever, at an angle to the movement imparted by the pivoted element and a reciprocatory hooked element for engagement with the thread and coöperating with the thread-carrying lever, substantially as described.

3. In a thread-laying mechanism for sewing-machines, the combination with a needle, a mechanism for actuating it, of a thread-laying mechanism for laying the thread about the needle comprising a thread-carrying lever, a pivoted element carried by the machine-frame and connected to said lever, said pivoted element having a movement at an angle to the axis of said lever, means for imparting movement to said lever at an angle to the movement of said pivoted element and a hooked member for engagement with the thread said hooked member having a movement at an angle to the angle of the movement of the pivoted member, substantially as described.

4. In a thread-laying mechanism for sewing-machines, an upstanding pivoted member carried by the machine-frame, a cam for actuating said pivoted member, a slide on the free end of such pivoted member, a support for said slide, a thread-carrying member connected to said slide, a lever engaging said thread-carrying member intermediate its ends, a cam for actuating said pivoted lever and a reciprocatory thread-engaging element coöperating with said thread-carrying element, substantially as described.

813,828. MACHINE FOR MAKING WIRE GOODS. JOHN C. PERRY, Clinton, Mass., assignor to Clinton Wire Cloth Company, Clinton, Mass. Filed Apr. 25, 1903. Serial No. 154,304.

Claim.—1. In combination with the coöperative elements of a wire-fabric machine, a series of stationary welding-jaws, a complemental series of yieldingly-mounted movable welding-jaws for welding strand and stay members, means for causing said jaws to grasp the parts to be welded, a series of primary circuit-closers, one for each pair or set of jaws, arranged to be operated in predetermined order, a series of primary circuit-breakers, one for each pair or set of jaws, arranged to be operated by the movable jaw of said pair or sets upon the softening of the metal to be welded.



2. In combination with the coöperative elements of a wire-fabric machine, means for feeding the strand-wire, means for feeding the stay-wire, means for subdividing the blank stay-wire, means for welding the stay-wire and strand-wire, and means for coiling the projecting end of the stay-wire.

3. In combination with the coöperative elements of a wire-fabric machine, a series of independent stay-wire receivers arranged out of the welding-plane, a cutter arranged to sever the stay-wire into blanks as it is fed into the receiver, and means for subdividing the severed blank.

4. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, a series of welding-jaws for welding strand and stay members, a welding connection for each pair of welding-jaws comprising a transformer, a copper bar forming one terminal of the secondary circuit, the said bar serving as a stationary welding-jaw, a copper bar forming the other terminal of said secondary circuit, a complemental movable welding-jaw, a laminated copper connection comprising a series of copper strips between said movable jaw and its complemental copper bar.

5. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, a series of welding-jaws for welding strand and stay members, a welding connection for each pair of welding-jaws comprising a copper bar constituting one terminal of the welding-circuit and formed with a contact-face terminating in a projecting ledge, a contact-plate arranged on said ledge, and means for maintaining said plate in contact with said face.

6. In combination with the coöperative elements of a wire-fabric machine, automatic means for forming welds, a stationary receiver for a stay-wire located outside of the welding-plane, and means for transferring a wire from said receiver to the welding means.

7. In combination with the coöperative elements of a wire-fabric machine, means for feeding a strand-wire, a series of welding members, a series of stay-wire receivers arranged outside of the welding-plane, and means for removing a stay-wire from said receivers and transferring it to the welding member.

8. In combination with the coöperative elements of a wire-fabric machine, a series of welding members, a series of stay-wire receivers positioned outside of the welding-plane and adapted to hold the stay-wires, a series of transferring devices also normally out of the welding-plane, and means to operate said devices to remove said wires from said receivers and transfer them to said welding members.

9. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, means for welding strand and stay members comprising a series of pairs of welding-jaws, a series of transformers for said welding-jaws, a series of primary circuits for said transformers, and means for closing said primary circuits in succession and in a predetermined selective order.

10. In combination with the coöperative elements of a wire-fabric machine, a series of stationary stay-wire receivers, a series of welding-jaws, a series of transferring-fingers, a rod upon which said fingers are mounted, and means for giving said rod a combined movement of rotation and translation to remove a wire from said receivers and transfer it to said welding-jaws.

11. In combination with the coöperative elements of a wire-fabric machine, two wire-holders each formed with a wire-passage inclosed upon one side by a yielding detent, means for severing the wire between said holders, and means for transferring the wire from said holders.

12. In combination with the coöperative elements of a wire-fabric machine, a shaft, two oppositely-arranged complemental cams on said shaft, a block loosely mounted between said cams, a pitman-strap slidingly arranged upon said block, a roller at each end of said strap arranged to be engaged by said cams, whereby a reciprocating motion is given to said pitman-strap.

13. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, a series of welding-jaws for welding strand and stay members, a secondary or welding circuit for each pair of jaws comprising a copper bar bent twice upon itself to form two coils, with an intervening space for reception of a primary coil, a copper bar provided with a welding-jaw connected to one terminal of said coiled bar, a copper bar connected to the other terminal of said coiled bar, a movable welding-jaw, and a laminated copper yielding connection between said last-mentioned bar and said movable welding-jaw.

14. In combination with the coöperative elements of a wire-fabric machine, means for receiving and holding a cross-wire, means for removing or liberating the cross-wire from the receiver or holder previous to welding, means for transferring or guiding said wire to the welding position, and means for welding.

15. In combination with the coöperative elements of a wire-fabric machine, means for welding crossed wires, means for holding a cross-wire crosswise of the longitudinal wires, but not in position for welding, means for transferring the cross-wire from the receiver to a position to be grasped by the welding-jaws.

16. In combination with the coöperative elements of a wire-fabric machine, independent stationary receivers or holders arranged to receive a cross-wire, combined with a wire-transferring mechanism arranged to remove said wire from said receivers and transfer it to the welding position.

17. In combination with the coöperative elements of a wire-fabric machine, a transfer device arranged normally out of the welding-plane, but adapted to carry a cross-wire into position for welding and to withdraw from the welding-plane as soon as said wire is clamped by the welding-dies, and means for operating said device.

18. In combination with the coöperative elements of a wire-fabric machine, a receiver arranged out of the welding-plane to receive and hold a cross-wire, means for removing said wire to the welding members, and means for welding said cross-wire to a plurality of strand-wires.

19. In combination with the coöperative elements of a wire-fabric machine, a stay-wire carrier operated to pass one side of a pair of coacting welding-jaws in placing the stay-wire in position for welding, and to withdraw entirely from the space between said coacting welding-jaws after the said stay-wire has been clamped in the welding-jaws, and while said welding is taking place.

20. In combination with the coöperative elements of a wire-fabric machine, a warp-wire, a holder for one or more cross-wires, means for liberating or removing said wire or wires from said holder one at a time, means for receiving and holding said liberated wire in a position to be grasped by coacting welding-jaws, and means for welding said warp and cross wires together at their intersections.

21. In combination with the coöperative elements of a wire-fabric machine, a holder for a cross-wire, welding-jaws operated to engage said wire to remove it from its holder and to weld the same to the strand-wires.

22. In combination with the coöperative elements of a wire-fabric machine, a guide for conveying a cross-wire into a position to be grasped by coacting welding-jaws, stops to receive and locate said wire, said stops being constructed to allow the cross-wire to pass on with the fabric after welding.

23. In combination with the coöperative elements of a wire-fab-

ric machine, means out of the welding or strand-wire plane for supporting cross-wires, means for moving said cross-wires into a position across strand-wires to be grasped by coacting welding-electrodes.

24. In combination with the coöperative elements of a wire-fabric machine, a beam or rail, means for reciprocating said rail, plungers yieldingly mounted in said rail carrying movable welding-jaws and springs for coacting upon said plungers to effect the upsetting pressure when welding.

25. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, means for welding strand and stay members comprising a pair of welding-jaws each provided with a contact welding-plate having a flat back or rear contact-face, beveled sides and a groove to receive the part to be welded.

26. In combination with the coöperative elements of a wire-fabric machine, an electrical welding device, a strand-wire feed, a stay-wire receiver arranged out of the plane of said welding device, a transferring device normally out of the plane of the welding device, and means for operating said transferring device to transport a stay-wire from said receiver to said welding device, and means for operating the welding devices to grasp the strand and stay wires and weld the same.

27. In combination with the coöperative elements of a wire-fabric machine, a wire-feed, a stationary knife, a movable thimble through which the wire is fed into the said machine alongside of said knife, and means for moving the thimble to draw the wire against the knife to sever said wire.

28. In combination with the coöperative elements of a wire-fabric machine, a stationary stay-wire receiver arranged out of the strand-plane, and independent means for transferring a stay-wire from the receiver to the strand-plane.

29. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection comprising a bar or head, means for reciprocating the same, a plunger yieldingly mounted in said head carrying a movable welding-jaw, and a spring coacting with said plunger to effect the upsetting pressure when welding.

30. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection, comprising a series of stay-wire receivers arranged out of the welding-plane and automatically-acting means for subdividing a blank held in said receivers.

31. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection, comprising means arranged to place a cross-wire in position to be grasped by the welding means and then to withdraw out of the strand-plane.

32. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection, comprising a cross-wire receiver, a cross-wire-transfer device arranged to place a wire in position to be grasped by the welding means, means for positioning the wire in the welding means arranged to permit the removal of the wire after the welding operation.

33. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection, comprising a stay-wire receiver arranged to permit the removal of a stay-wire therefrom, a transfer device arranged to remove a wire from said receiver and place it in a position to be grasped by the welding means and having provision to permit the releasing of said wire after it is engaged by said welding means.

34. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection, comprising a stay-wire receiver, a transfer device, comprising two wire-engaging members, one of which is movable and arranged as a finder or means for guiding the stay-wire between said members.

35. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for positioning and welding said strand and stay wires at points of intersection, a fabric-drum, and means including an adjustable belt-tightener for driving said drum to take up the fabric.

36. In combination with the coöperative elements of a wire-fabric machine, an intermittently-operated stay-wire feed, comprising means for gripping and feeding the wire and mechanism for driving said means including a continuously-driven but intermittently-deflected pawl.

37. In combination with the coöperative elements of a wire-fabric machine, a stay-receiver, comprising a member formed with a segmental groove terminating in a wire-receiving slot and a spring-pressed finger formed with a complemental segment adapted to fit into said groove and yieldingly retain the stay-wire in said slot but to permit the removal of the wire therefrom.

38. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection, a stay-wire cutter comprising a stationary knife, a sliding thimble or member, and means for moving said member to draw the wire against the knife to sever the wire.

39. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for receiving and holding a stay-wire, means for subdividing said wire after it is fed into the receivers, and means for welding said wires at points of intersection.

40. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for receiving the stay-wire, means for subdividing said wire, and means for welding said wires at points of intersection.

41. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection, a stay-wire coiler, comprising a stationary pin or anvil and a reciprocating bending-pin adapted to bend the end of a stay-wire about said anvil and means for operating said pin.

42. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for positioning and welding said wires at points of contact, and means for controlling the welding action, comprising a transformer for each pair of welding-jaws, a circuit-closer for the primary circuit of each transformer, and means for selectively operating said closers.

43. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for positioning and welding said wires at points of intersection, said welding means including a plurality of pairs of welding-jaws and a transformer for each pair of welding-jaws, a break-switch in the primary circuit of each transformer, a movable girth arranged to close said switches as a gang, and means carried by one member of each pair of welding-jaws for independently opening its individual switch.

44. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for positioning and welding said wires at points of intersection comprising a gang of rear stationary welding-jaws, a series of independent movable complemental front welding-jaws, means for moving the front jaws as a gang to grasp the wires, and provision whereby each front jaw moves independently to upset the weld.

45. In combination with the coöperative elements of a wire-fabric machine, means for feeding the strand-wires, means for feeding a stay-wire, means for positioning and welding said wires at points of intersection, comprising a gang of stationary welding-jaws or electrodes, a movable girth, a complemental series of independent welding-jaws yieldingly mounted in said girth, means for operating said girth to advance the movable jaws to permit the wires to be grasped between each front and rear welding-jaw, with provisions whereby each movable welding-jaw moves independently to upset the weld.

46. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection to form a fabric, said stay-wire-feeding means comprising a device to place a stay-wire in position to be grasped by the welding means and then withdraw out of the strand-plane.

47. In combination with the coöperative elements of a machine for making wire fabric, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection to form a fabric, said stay-wire-feeding means comprising a receiver and an independent transfer device arranged to remove the wire from said receiver and place it in position to be received by the welding means.

48. In combination with the coöperative elements of a machine for making wire fabric, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection to form a fabric, said stay-wire-feeding means comprising a receiver arranged to permit the removal of a stay-wire therefrom, an independent transfer device arranged to remove a wire from said receiver and position it to be grasped by the welding means, and having provision to permit the release of said wire after it is engaged by said welding means.

49. In combination with the coöperative elements of a machine for making wire fabric, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection to form a fabric, said stay-wire-feeding means comprising a receiver and an independent transfer device, said device being composed of two wire-engaging members, one of which is movable and arranged as a finder or means of guiding the stay-wire between said members.

50. In combination with the coöperative elements of a wire-fabric machine, a transfer device, comprising two members, one of which is movable with relation to the other and having a part for locating the stay-wire and guiding it in position to be grasped by said transfer member.

51. In combination with the coöperative elements of a wire-fabric machine, automatic welding means, means for feeding strand-wires, means for feeding a stay-wire, comprising two members, one of which is movable with relation to the other and formed with an extension or part for locating the stay-wire and guiding it in position to be grasped by said members, and a spring arranged to yieldingly maintain the movable member against its complemental member except when opened by resistance offered through the stay-wire.

52. In combination with the coöperative elements of a wire-fabric machine, a dovetailed rail, a series of arms adapted to rest on said rail, each formed with a lip to engage the under side of the rail, and clamps arranged to engage said arms on the opposite side of said rail whereby said arms may be secured in any desired position of adjustment.

53. In combination with the coöperative elements of a wire-fabric machine, a series of movable electrodes, a complemental series of break-switches, a movable rail or girth arranged to set or close said switches, and means whereby each electrode automatically breaks or opens the switch of its circuit.

54. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, means for feeding a stay member, means for welding said members at points of intersection, comprising a pair of welding-jaws, a transformer, a copper bar connecting each jaw to a terminal of the secondary circuit of the transformer, said copper bars being secured together but insulated from each other.

55. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, means for feeding a stay member, means for welding said members at points of intersection, comprising a series of pairs of welding-jaws, a transformer for each pair of welding-jaws, a series of primary circuit-closers, means for operating said closers selectively in advance of the welding operation, a break-switch for each pair of welding-jaws, and means controlled by the amount of upset for automatically opening each break-switch individually.

56. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, means for feeding a stay member, means for welding said members at points of intersection, comprising a plurality of pairs of welding-jaws, a transformer for each pair of welding-jaws, a copper bar forming each terminal of the secondary circuit of each transformer, one welding-jaw of each pair being connected to one end of one of said bars, and a laminated copper connection between the complemental jaw and one end of the complemental bar.

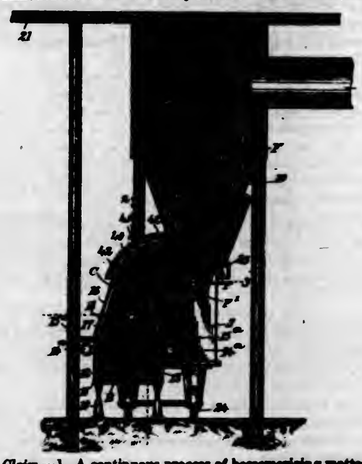
57. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, means for feeding a stay member, means for welding said members at points of intersection, comprising a plurality of pairs of welding-jaws each connected to a stationary copper bar, a transformer for each pair of welding-jaws, the secondary circuit of the transformer being composed of a copper bar formed in two coils with a space between the coils, one end of the coil being connected to one of the stationary bars and the other end of the coil to the other end of the other stationary bar, the primary circuit of the transformer being composed of a wire coil arranged in the space between the loops or turns of the secondary circuit.

58. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, means for feeding a stay member, means for welding said members at points of intersection, comprising a series of pairs of welding-jaws, a transformer for each pair of welding-jaws, a primary circuit open at two points for each transformer, a series of closers, a series of break-switches, means for selectively operating the closer of each primary circuit in advance of the welding action and maintaining the circuit closed at this point during the welding action, means for closing the break-switches in advance of the welding action, and means whereby the opening of each break-switch is controlled by the amount of upset of the weld.

59. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand-wires, means for feeding a stay-wire, means for welding said wires at points of intersection, comprising a plurality of stationary welding-jaws, a plurality of complemental movable welding-jaws, means for moving the movable jaws as a gang to grasp the work, and means whereby each movable jaw has an independent upsetting movement.

60. In combination with the coöperative elements of a wire-fabric machine, means for feeding strand members, means for feeding a stay member, means for welding said members at points of intersection, comprising a series of welding units, a source of power, means for selectively and independently connecting each welding unit with the source of power, an independent power-disconnecting device for each unit, and means controlled by each unit for automatically operating its power-disconnecting device upon the completion of the welding operation of that unit.

813,824. **SMELTING AND REFINING PROCESS.** ENOS C. POLLARD, Seattle, Wash. Filed May 21, 1904. Serial No. 209,201.



Claim.—1. A continuous process of bessemerizing matter, consisting in passing a stream of siliceous slag over the bessemerizing regions to absorb the products of bessemerizing blasts, discharging this slag from the bessemerizing region into contact with siliceous material to dissolve the silica and incorporate it in the slag, discharging a part of the slag, and returning the remainder of the slag to the bessemerizing regions while still in a molten condition.

2. A process of bessemerizing matter, consisting in passing a stream of siliceous slag over the matte in the bessemerizing regions, discharging the slag from the bessemerizing region into contact with siliceous material continuously, discharging a part of the slag, and returning the remainder thereof to the bessemerizing regions.

3. A continuous process of bessemerizing copper matter, consisting in passing a stream of siliceous slag over the bessemerizing regions, discharging the slag into contact with ferrous sulfid to reduce any copper carried by the slag to a subsulfid, discharging a part of the slag, and returning the remainder thereof together with ferrous and cuprous sulfids, to the bessemerizing regions to supply matte to the bessemerizing regions.

4. A continuous cyclical process of reducing ore containing sulfur, consisting in melting it in the presence of a flux to produce matte, separating matte and slag from the ore, passing a stream of slag over the matte, bessemerizing the matte in the presence of the slag, returning a part of the slag to the ore-melting regions to furnish a flux for additional ore, and returning the slag with new matte to the bessemerizing regions.

5. The process of bessemerizing, consisting in passing a stream of siliceous slag over the material while being subjected to bessemer-

being blasts, causing a mixture of cuprous oxid and cuprous sulfid to reast beneath a column of molten slag, thereby causing the formation of sulfur dioxid within the slag and forcing the slag by the dynamic energy due to the effervescence thus produced, together with the kinetic energy of the bessemerizing blasts, into the presence of ore being fused in a higher plane than that from which it was introduced into the converter, and thereafter causing the matte and siliceous slag to flow into the bessemerizing region by the force of gravity.

6. A process of bessemerizing consisting in passing a stream of siliceous slag over the material while being subjected to bessemerizing blasts, causing a reaction beneath a column of molten slag to produce a gas within the slag and force the latter by the dynamic energy of effervescence thus produced together with the kinetic energy of the bessemerizing blasts into the presence of ore being fused, and thereafter causing the matte and siliceous slag to flow back into the bessemerizing region by the force of gravity.

7. The process of bessemerizing matte, which consists in maintaining over the matte a layer of liquid siliceous slag obtained from fusing the ore, passing a blast of air through the matte and through said supernatant layer of slag, and in expelling the slag from the presence of the matte by the combined agency of the kinetic energy of the bessemerizing blasts and effervescence due to oxidizing the sulfur in the matte.

8. The process of bessemerizing matte, consisting in passing a stream of siliceous slag over the matte in the bessemerizing region, continuously discharging the slag from the bessemerizing region into contact with a siliceous material, and returning a part of the slag to the bessemerizing region.

9. A continuous cyclical process of reducing copper ores containing sulfur, consisting in melting them in the presence of a flux to produce matte, separating matte and slag from the ore, passing a stream of slag over the matte, bessemerizing the matte in the presence of slag, drawing off the lighter portion of the slag, returning a part of the slag to the ore-smelting regions in a higher plane than the bessemerizing regions, and returning the slag from the melting regions with new matte to the bessemerizing regions.

10. A process of refining metals, which comprises the fusing of a charge of ore containing sulfur and an excess of silica, retaining all the iron of the ore in the matte, running off and settling the resultant matte and siliceous slag, and returning portions of the slag into the presence of the ore.

11. A process of refining metals, which consists in fusing a charge of ore containing copper, iron, sulfur and an excess of silica, without oxidizing the iron and the major portion of the sulfur, running off and settling the resultant matte and slag, and returning portions of the slag into the presence of the ore.

12. A process of refining metals, comprising the fusing of ore containing sulfur, the bessemerizing of the matte produced, and the cyclical circulation of a stream of slag alternately to the fusing and bessemerizing regions.

13. A process of refining sulfid copper ores which comprises fusing the metallic contents of the ore in the presence of a flux and retaining in the matte the iron and the major portion of the sulfur contained in the ore in an unoxidized condition and bessemerizing the resulting material.

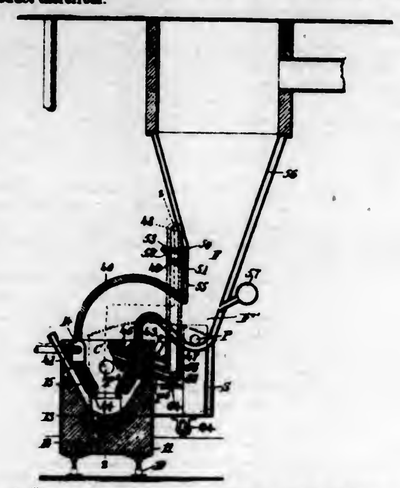
14. A process of refining metals which comprises fusing ore containing sulfur, copper and iron, bessemerizing the matte produced, continuously running off the lighter portions of the slag, and cyclically circulating a stream of richer slag alternately to the fusing and bessemerizing regions.

813,825. SMELTING AND REFINING APPARATUS. ELMER C. POLLARD, Seattle, Wash. Filed Apr. 26, 1905. Serial No. 257,206.

Claim.—1. The combination of a furnace having a boot or bowl-like portion at its lower end, a converter having a throat opening into the lower part of the furnace, a settler, and means for conducting molten materials from the boot of the furnace into the settler and from the settler into the converter.

2. The combination of a furnace having a boot or bowl-like portion at its lower end, a converter having a throat opening into the lower part of the furnace, a settler, means for conducting molten materials from the boot of the furnace into the settler and from the settler into the converter, and a receiver in communication with the converter to receive finished product therefrom.

3. The combination of a converter, a melting-furnace, means for establishing a cyclical passage of molten materials from the converter to the furnace and from the furnace to the converter, and a receiver in communication with the converter to receive finished product therefrom.



4. The combination of a converter, a melting-furnace, and means for causing molten material to flow from the converter to a point in the furnace at a higher level than the converter, discharge said materials onto the contents of the furnace, and cause a transfer of materials from the interior of the furnace into the converter.

5. The combination of a converter, a melting-furnace, means for establishing a passage of molten materials from the converter to the furnace and from the furnace to the converter, and a settler or forehearth located in and forming part of the path of the molten materials.

6. The combination of a converter, a melting-furnace, means for conducting material from the furnace to the converter, and separate means for conducting materials from the converter to the furnace.

7. The combination of a furnace having a depressed lower portion, a converter located at a lower level than the bottom of the furnace, said converter having a hood communicating with its top and with the furnace, means for conducting materials from the lower part of the furnace into the converter, and means for conducting materials from the converter into the upper part of the furnace.

8. The combination of a furnace, a converter located at a lower level than the bottom of the furnace, means for conducting material from the lower part of the furnace into the converter, and means for conducting material from the converter into the upper part of the furnace.

9. The combination of a furnace, a converter, means for conducting material from the lower part of the furnace into the converter, and means for conducting material from the converter into the upper part of the furnace.

10. The combination of a converter, a melting-furnace, means for conducting material from the furnace to the converter, and separate means for conducting materials from the converter to the furnace; said separate means comprising a conductor discharging into the furnace, and means in the conductor for forcing material therein to ascend.

11. The combination of a converter, a melting-furnace, means for conducting material from the furnace to the converter, and separate means for conducting materials from the converter to the furnace, said separate means comprising a conductor discharging into the furnace and means in the conductor for forcing material therein to ascend; said last-named means comprising an explosion-tube and means for conducting a mixture of explosive gases into said tube.

12. The combination of a converter, a melting-furnace, means for conducting material from the furnace to the converter, and separate means for conducting materials from the converter to the furnace; said separate means comprising a conductor discharging into the furnace, and means in the conductor for forcing material therein to ascend; said last-named means comprising a conical explosion-tube having an open upper end and a passage in its lower end, a valve for closing said passage, a pair of chambers normally separated from each other, said valve controlling communication between said chambers, and yielding means for normally forcing the valve to close communication between said chambers and also to close the opening in the bottom of the explosion-tube.

13. The combination of a melting-furnace, a converter located at a lower level than the melting-furnace and having a discharge-opening adapted to deliver slag by gravity from the converter, a stand-pipe communicating with the lower end of said discharge-opening and extending to a point above the bottom of the furnace, a pipe for conducting material from the stand-pipe to the furnace above the charging-line thereof, and means for causing materials in the stand-pipe to ascend therein and be discharged into the furnace.

14. The combination of a melting-furnace, a converter having a discharge-opening adapted to deliver slag from the converter, a stand-pipe communicating with said discharge-opening and extending to a point above the bottom of the furnace, a pipe for conducting material from the stand-pipe to the furnace, and means for causing material in the stand-pipe to ascend therein and be discharged into the furnace.

15. The combination of a converter, a conductor for conveying materials therefrom, and means in the conductor for forcing material therein to ascend; said last-named means comprising a conical explosion-tube having an open upper end and a passage in its lower end, a valve for closing said passage, a pair of chambers normally separated from each other, said valve controlling communication between said chambers, and yielding means for normally forcing the valve to close communication between said chambers and also to close the opening in the bottom of the explosion-tube.

16. The combination of a converter, a melting-furnace, and means for conducting material from the converter to the furnace, comprising a conductor, an explosion-tube in the conductor for forcing material therein to ascend, and means for conducting a mixture of explosive gases into said tube.

17. The combination of a furnace having a depressed lower portion, a converter located at a lower level than the bottom of the furnace, said converter having a hood communicating with its top and with the furnace, means for conducting materials from the lower part of the furnace into the converter, and means for conducting materials from the converter into the upper part of the furnace; said converter having passages in its walls constituting twyers, and opening near the bottom of the converter.

18. The combination of a converter having passages molded in its walls and opening at the bottom thereof, said passages constituting twyers, means for conducting compressed air to said passages, a melting-furnace, means for conducting molten materials from the melting-furnace to the converter, and means for conducting molten materials from the converter to the melting-furnace.

19. The combination of a converter having a molded lining, and a pipe constituting a portion of the inner wall of the lining, a passage in the lining constituting a twyer and passages for conducting air from the pipe to the twyer, and means for conducting molten material from the converter.

20. The combination of a converter, said converter being provided with inclined passages in its walls upon opposite sides thereof and converging toward the bottom of the converter, bustle-pipes also in its walls and constituting part of the inner face thereof, passages from the bustle-pipes to the inclined passages, and water-cooling pipes located above the mouths of the inclined passages within the converter, and means for conducting molten materials from the converter.

21. The combination of a converter, a furnace into which the converter discharges, a settler, means for conducting molten material from the furnace to the settler and from the settler to the converter, a vertically-adjustable overflow-conductor in the settler, and a receiver in communication with the lower part of the converter to receive the finished product thereof.

22. The combination of a converter, a furnace into which the converter discharges, a settler, means for conducting molten materials from the furnace to the settler and from the settler to the converter, a vertically-adjustable overflow conductor in the settler, and a receiver in communication with the lower part of the converter to receive the finished product thereof; said receiver constituting a portion of the converter and being separated therefrom by a non-conducting partition.

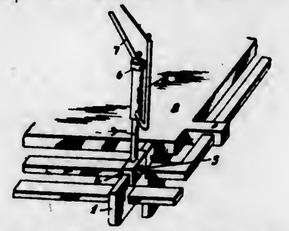
813,826. EAVES-TROUGH HANGER. WILLIAM G. RAU, Louisville, Ky. Filed Oct. 11, 1905. Serial No. 282,267.

Claim.—1. An eaves-trough hanger consisting of the strap adapted to embrace the trough, and a V-shaped brace secured upon said strap and adapted to depress said strap and deflect water from said strap into the trough.

2. In an eaves-trough hanger, the combination with a strap embracing the trough, of a V-shaped brace secured upon said strap adjacent the edge of the trough and adapted to deflect water from said strap into the trough.

3. In an eaves-trough hanger, the combination with a trough and a strap embracing said trough, of a brace having slots therein adapted for the reception of the strap, said brace adapted to depress said strap and deflect the water from the strap into the trough.

813,827. DRAFTING INSTRUMENT. GEORGE RIND, Allegheny, Pa., assignor of one-third to Harvey H. Smith, Pittsburg, Pa. Filed June 13, 1905. Serial No. 265,067.



Claim.—1. The combination with a drafting-table, of a bracket carried by one edge thereof, a standard detachably connected to said bracket, a beam revolubly attached to said standard, an upwardly-extending arm carried by said standard adjacent to said standard, an adjustable wire connecting the top of said arm and the outer end of said beam, a sleeve adjustably mounted upon said beam, a plate carried by said sleeve, a shaft rotatably mounted in said plate, and a beam-compass carried by the lower end of said shaft, substantially as described.

2. The combination with a drafting-table having an upwardly-extending bracket, of a standard detachably secured to said bracket, a beam pivotally connected to said standard, a sleeve slidably mounted upon said beam, a plate carried by said sleeve, a shaft journaled in said plate, a beam-compass carried by the lower end of said shaft, means to adjustably support the outer end of the first-named beam, means to revolve said shaft, and means to lock said sleeve in engagement with said beam, substantially as described.

3. The combination with a table, of a bracket carried by one edge of said table, a standard detachably secured to said bracket, a beam pivotally mounted upon said standard, an adjustable beam-compass slidably mounted upon said beam, means to rotate said beam-compass, and means to support the outer end of the first-named beam, substantially as described.

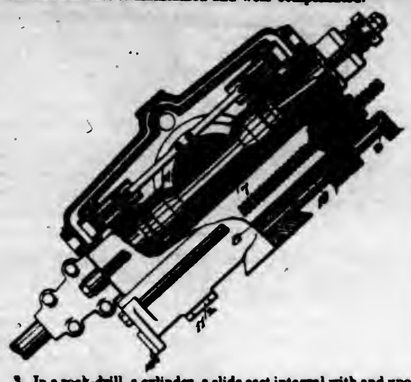
4. The combination with a table, of a bracket mounted at one edge of the table, a standard detachably mounted on said bracket, a beam pivotally mounted upon said standard, a sleeve slidably mounted on said beam, a horizontal plate carried by said sleeve, a vertically-disposed rotary shaft carried by said plate, a member carried by said shaft and adjustable thereon, a beam passing through said member, adjustable heads mounted on said last-named beam, and markers carried by said heads.

813,828. ROCK-DRILL. EDWARD A. RIX, San Francisco, Cal. Filed Aug. 16, 1905. Serial No. 274,457.

Claim.—1. The combination in a rock-drill, of a cylinder, having a slide fixed to and projecting from its bottom, a shell within which said slide is movable, the bottom of said slide and the bottom of the guide being spaced from each other, and means operable in said space between said bottoms and adjustable in one direction to compensate for wear between the bottom and also the sides of said guide.

2. In a rock-drill, a slide cast integral with the cylinder and parallel with the bore thereof, said slide having diverging sides, a shell having corresponding interior surfaces between which the slide is

movable, the bottom of the slide and the bottom of the guide being separated from each other, and a wear-plate in the space between said bottoms and adjustable in one direction whereby contact between said surfaces is maintained and wear compensated.



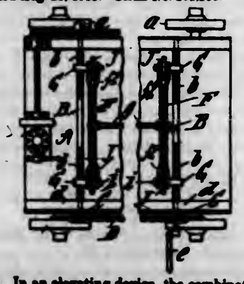
3. In a rock-drill, a cylinder, a slide cast integral with and upon one side of said cylinder, and having divergent sides; a shell having corresponding sides within which the slide is movable, a take-up plate bearing against the bottom of the slide and occupying a space between the bottom or outer surface of the slide and the interior of the shell, and means for adjusting said plate.

4. The combination with a rock-drill and the cylinder thereof of a hollow shell, with upwardly-convergent sides, a projection from the bottom of the cylinder with sides fitting and slidable against the sides of the shell, said shell and projection having bottoms spaced from each other, and a take-up plate in the said space between said bottoms, and means for adjusting said plate upwardly.

818,829. SUPPOSITORY. HERMAN ROSARTS, St. Louis, Mo., assignor of one-half to Frederick S. Hasbarin, St. Louis, Mo. Filed Nov. 8, 1905. Serial No. 287,943.

Claim.—The combination with a compressed expansive porous body and a cord secured thereto, of a solid homogeneous protective shell of medicated composition which entirely incloses and seals the expansive porous body and a portion of the cord which joins with said porous body, and which protective shell is fusible at the temperature of the body; substantially as specified.

818,880. ELEVATING DEVICE. ELI ROSEBOUX, Springfield, Minn. Filed Aug. 28, 1905. Serial No. 275,206.



Claim.—1. In an elevating device, the combination with a bottom platform or support, a pair of horizontal parallel right and left threaded screw-shafts journaled for rotation thereon, and means for concurrently turning said shafts, of two pairs of nuts or screw-engaging parts on said shafts, opposite sets of lazy-tongs having the crossed lower members thereof pivotally engaged with said nuts, wheels or rollers provided for rotation on the pivots of the lower lazy-tongs bars, and having rolling supports on said bottom platform in lines parallel with the lengths of said screws, and a platform or supporting structure, supported at the tops of said sets of lazy-tongs.

2. In an elevating device, the combination with a bottom platform or support, a pair of horizontal parallel right and left threaded screw-shafts journaled for rotation thereon, and means for concurrently turning said shafts, of two pairs of nuts or screw-engaging parts, opposite sets of lazy-tongs having the crossed bar members thereof pivotally engaged with said nuts, and a platform or supporting structure, having at its opposite end portions centrally located, rigidly-affixed depending members pivotally connected at the junctions of the top pairs of lazy-tongs bars, and said platform also having at the middles of their end portions outside the said lazy-tongs rigidly-affixed depending bars, and guiding members, having vertical ways therethrough, affixed to each end of one of the pivot-bars between opposite pairs of the lazy-tongs bars which are below the top bars, in which members said depending bars have guiding engagements.

3. In an elevating device, the combination with a bottom platform or support, a pair of horizontal parallel right and left threaded screw-shafts journaled for rotation thereon, and means for concurrently turning said shafts, of two pairs of nuts or screw-engaging parts having horizontal transversely-extending studs, wheels mounted for rotation on said studs and running on said platform, opposite sets of lazy-tongs having the crossed lower bars thereof fork-shaped, engaged on said nut-studs and embracing said wheels, and nuts on the extremities of the studs and confining the forked lazy-tongs bars and said wheels in place on the nut-studs.

4. In an elevating device the combination with a bottom platform, a pair of horizontal parallel right and left threaded screw-shafts journaled for rotation thereon and each having a sprocket-wheel, a sprocket-chain running around said wheels, and means for rotating one of said screw-shafts, of two pairs of nuts having horizontal transversely-extending studs, wheels mounted for rotation on said studs, and running on said platform, opposite sets of lazy-tongs having the crossed lower bars thereof fork-shaped, engaged on said nut-studs and embracing said wheels, and nuts on the extremities of the studs and confining the forked lazy-tongs bars and said wheels in place on the nut-studs.

818,881. RAIL-JOINT. ALBERT T. ROWLANDS, Carrick, Pa. Filed Nov. 21, 1905. Serial No. 288,411.

Claim.—1. The combination of two sections of rails having their base-flanges scalloped, a chair having a seat formed therein, said seat having scalloped sides corresponding to the scalloped base-flanges of said rails, substantially as described.

2. The combination with a rail having the edge of its base-flange scalloped, of a chair having a seat formed therein, said seat having scalloped sides adapted to engage the base-flanges of said rail, substantially as described.

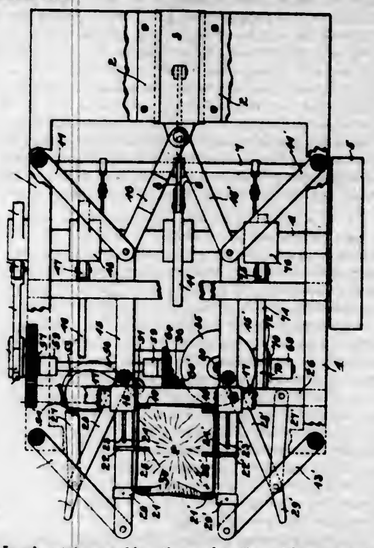
818,882. BAG-TYING MACHINE. PETER RUSS, Chicago, Ill. Filed May 28, 1904. Serial No. 210,128.

Claim.—1. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm, shuttle mechanism acting in conjunction with said needle-arm to form a loop of tying-cord about the folded part, a rotatable thimble in which said loop becomes disposed, said thimble being provided with wire, and means upon rotation of said thimble for causing said wire to be twisted about the ends of said loop to secure the folded end of the bag.

2. In a bag-tying machine, the combination with folding means for folding the mouth of a bag after filling thereof, of means independent of said folding means for looping cord about the folded part of the bag, and means for twisting wire about the ends of the loop to securely tie the bag.

3. In a bag-tying machine, the combination with a supporting-frame, of a stationary cross-bar thereon, jaw members extending forwardly from said stationary cross-bar at right angles thereto, means for suspending an empty bag between said stationary bar and said jaw members, and means for moving said jaw members parallelly toward each other and toward said stationary member, whereby the mouth of said bag is folded.

4. In a bag-tying machine, the combination with a supporting-frame, of a stationary cross-bar thereon, jaw members extending forwardly from said stationary bar, means for suspending an empty bag from said jaw members, means for moving said jaw members toward each other and toward the stationary bar to fold the mouth of the bag, arms pivoted to said jaw members and adapted upon movement of said jaw members to assist in folding the bag and securing the folded bag against the stationary bar, and means for tying the bag when folded.



5. In a bag-tying machine, the combination with a supporting-frame, of a stationary cross-bar thereon, jaw members extending forward from said bar, hooks suspended from said jaw members, arms pivoted to said jaw members, means for causing the jaw members to move toward said stationary bar to fold the bag, and means for causing said arms to swing against the bag to assist in the folding operation and to secure the folded part of the bag against the stationary bar, means for looping cord about the folded part, and means for securing together the loop ends to securely tie the bag.

6. In a bag-tying machine, the combination with a supporting-jaw consisting of a stationary transverse rear member and forwardly-extending longitudinal side members, of hooks supported from the side members for receiving an empty bag, mechanism for causing said side members to move toward each other and toward the rear member, arms for assisting the side members to fold the mouth of the bag at the center thereof, and means upon folding of said bag for removing the bag from the hooks.

7. In a bag-tying machine, the combination with a supporting-jaw consisting of a stationary rear member and forwardly-extending side members, of hooks disposed about said jaw for supporting the bag, means for causing said side members to move toward each other and toward the stationary rear member to fold the mouth of the bag, and a shield over said hooks adapted upon closure of said jaw to remove the bag from the hooks.

8. In a bag-tying machine, the combination with a supporting-jaw consisting of a stationary rear member and forwardly-extending side members, of hooks carried by said members for supporting the bag, means causing said side members to move toward each other and toward the rear stationary member to fold the mouth of the bag, arms adapted to engage the folded portion of the bag to hold the folded portion against the rear stationary member, and means associated with each hook for removing the bag from the hooks upon closure of the jaw.

9. In a bag-tying machine, the combination with a supporting-frame, of a stationary cross-bar secured to the front end thereof, link members extending transversely over said cross-bar, the forward ends of said links forming a jaw with said cross-bar, hooks suspended in said jaw from said link members for supporting the bag, link mechanism connected with said connecting-links for moving said links parallelly toward each other and toward said cross-bar to fold the mouth of the bag in the jaw, and arms pivoted to said connecting-links adapted upon movement of said links to close over a folded part of the bag to secure said part against the stationary cross-piece.

10. In a bag-tying machine, the combination with a supporting-frame, of a cross-bar secured to the forward end thereof, parallel connecting-links extending transversely over said cross-bar, links connecting said connecting-links with the machine-frame, a cross-head connected with the rear ends of said connecting-links, cam mechanism for moving said cross-head to cause said connecting-links to move parallelly toward each other and toward the rear of the machine, the forward ends of said connecting-links forming a jaw with said stationary cross-bar, hooks for said jaw suspended from said connecting-links, actuation of said cross-head causing the said jaws to close the fold of the mouth of the bag, arms pivoted to said connecting-links, the ends of said arms adapted upon actuation of said connecting-links to cross over the folded part of the bag to secure this part against the stationary bar, means for removing the hooks from the bag after folding thereof, and means for tying the folded bag.

11. In a bag-tying machine, the combination with a supporting-frame, of a stationary cross-bar secured to the front end thereof, journal-boxes adapted for sliding engagement with said stationary bar, parallel connecting-links adapted to slide through said journal-boxes and transversely across said stationary bar, links connecting the ends of said connecting-links with the machine-frame, a cross-head connected with the rear ends of said connecting-links, cam mechanism for reciprocating said cross-head to cause said connecting-links to move parallelly toward each other and toward the rear of the machine, the forward end of said connecting-links forming a jaw with said stationary bar, hooks for said jaw suspended from said connecting-links and from said journal-boxes for supporting the bag, the mouth of said bag being folded upon rearward motion of said cross-head, arms pivoted to said connecting-links, the ends of said arms being adapted to engage over the folded part of the bag to secure this part against the stationary bar, means for removing the hooks from the bag after folding thereof, and means for tying the bag upon folding.

12. In a bag-tying machine, the combination with a supporting-frame, of a stationary cross-bar at the forward end thereof, journal-boxes adapted to slide on said cross-bar, sleeves passing through transverse openings through said boxes, connecting members passing through said sleeves and transversely over said stationary bar to form a jaw at their forward end with said bar, links connecting the ends of said connecting members with the machine-frame, a cross-head connected with the rear ends of said connecting members, means for moving said cross-head to bring said connecting members toward each other and toward the rear of the machine to close the jaw, hooks secured to the forward ends of said connecting-links, hooks secured to said boxes and hooks secured to said sleeves, said hooks serving to support the bag to be tied, said bag being folded at the mouth upon closure of said jaw, arms connected to said connecting members, means for closing the ends of said arms over the folded part of the bag upon rearward travel of the cross-head to secure the folded part against the stationary cross-bar, and means for tying the bag when folded.

13. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of means independent of said folding means for disposing a cord-loop about the folded part, and means for applying turns of wire about the loop ends adjacent to the folded part, the loop ends remaining stationary.

14. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm adapted to form a loop of tying-cord about the folded part, a slotted thimble in which said loop becomes disposed, means for inserting wire in said thimble, and means for rotating said thimble to tie said wire about the loop ends, whereby said bag is tied.

15. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm, shuttle mechanism acting in conjunction with said needle-arm to form a loop of tying-cord about the folded part of the bag independent of the folding means, and means for twisting a length of wire about the ends of said loop, whereby said bag is tied.

16. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm, shuttle mechanism acting in conjunction with said needle-arm to form a loop of tying-cord about the folded part, a thimble having a slot in which said loop becomes disposed, said thimble being provided with wire extending radially therethrough into said slot, and means for rotating said thimble to twist said wire about the ends of said loop.

17. In a bag-tying machine, the combination with means for

folding the mouth of a filled bag, of a needle-arm for conveying tying-cord, a slotted thimble disposed before the folded portion, a bearing in which said thimble may revolve, said bearing having a slot adapted to register with the slot through said thimble, there being a passage-way extending through said bearing and thimble into said thimble-slot, shuttle mechanism acting in conjunction with said needle-arm to form a loop of tying-cord about the folded part of the bag and to dispose the ends of said loop in said thimble-slot, means for causing rotation of said thimble within said bearing, and means upon such rotation for causing a length of wire sheared through said radial passage-ways and into the thimble-slot to be sheared off and twisted about the ends of said cord-loop.

18. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm adapted to convey tying-cord, a thimble having a longitudinal slot disposed before the folded part of the bag, a bearing in which said thimble may rotate, said bearing having a longitudinal slot adapted to register with the slot through said thimble, there being a passage-way extending radially through said bearing and said thimble-walls and through the thimble-slot, an end plate secured to said bearing and provided with an opening for receiving the end of a feed-wire extending through said passage-way, shuttle mechanism for forming a loop of tying-cord about the folded part of the bag and for disposing the loop ends within the slot through said thimble, and means for rotating said sleeve within said bearing, whereby the end is sheared from the feed-wire and whereby said end is twisted about the end of the cord-loop.

19. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm for conveying tying-cord from a supply-reel, a thimble having a longitudinal slot disposed with its end before the folded part of the bag, said thimble having a radial passage-way extending into said slot, a stationary part adjacent to the end of said slot having an opening for receiving a wire extending through said slot, shuttle mechanism acting in conjunction with said needle-arm for forming a loop of tying-cord about the folded part of the bag and for disposing said loop ends within said slot, means for rotating said thimble, whereby said wire is twisted about the end of said loop, and means for severing said loop from the remainder of the cord.

20. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm for conveying tying-cord from a supply-reel, a thimble having a longitudinal slot disposed with its end before the folded part of the bag and having a passage-way extending radially into said slot, a stationary part adjacent to the end of said slot having an opening for receiving a wire extending through said slot, shuttle mechanism acting in conjunction with said needle-arm for forming a loop of tying-cord about the folded part of the bag and for disposing said loop within said slot, teeth at the end of said thimble, a gear-wheel engaging said teeth for causing rotation of said thimble to cause said wire to be twisted about the loop ends close to the folded part of the bag, a knife secured to said gear-wheel, and means for causing said knife to sever said loop from the remaining cord after said wire has become twisted about the loop ends.

21. In a bag-tying machine, the combination with a thimble having a longitudinal slot extending radially to its center, of a needle-arm, shuttle mechanism acting in conjunction with said needle-arm, said needle-arm and shuttle mechanism being normally disposed to extend tying-cord across the end of said slot, means for folding the mouth of a filled bag and disposing the folded part before the end of said slot and before said cord, means for causing actuation of said needle-arm to convey said tying-cord toward said shuttle to be looped about the folded portion of the bag, means for causing said shuttle mechanism to convey the ends of the formed loop into said thimble-slot across a wire extending into said slot, and means for causing rotation of said thimble for twisting said wire about the loop ends.

22. In a bag-tying machine, the combination with a thimble having a longitudinal slot extending radially to its center, of a needle-arm normally disposed to one side of said thimble for carrying tying-cord, rotary shuttle mechanism disposed at the other side of said thimble, said tying-cord normally passing through the needle-eye and by the end of said thimble-slot, the end of said cord being held by said shuttle mechanism, means for folding the mouth of a filled bag and disposing the folded portion before the end of the thimble-slot and against the tying-cord, means for causing actuation of said needle-arm to carry the tying-cord toward said shuttle mechanism to form a loop about the folded portion of the bag, means for causing rotation of said shuttle mechanism to dispose the ends of said formed loop within the thimble-slot, there being a passage-way near the forward end of said thimble extending radially and forwardly toward the mouth of said slot for receiving a wire, a stationary member having an opening disposed before the mouth of said slot for receiving and securing the end of said wire, and means for causing rotation of said thimble, whereby said wire is twisted spirally about the ends of the cord-loop in said slot.

23. In a bag-tying machine, the combination with a thimble having a longitudinal slot extending to its center and having a transverse passage-way for receiving a wire extending into said slot, of a needle-arm normally disposed to one side of said thimble for carrying tying-cord, rotary shuttle mechanism disposed at the other side of said thimble, said tying-cord normally passing through the needle-eye and by the end of said thimble-slot, the end of said cord being held by said shuttle mechanism, means for folding the mouth of a filled bag and disposing the folded portion before the end of the thimble-slot and against the tying-cord, means for causing actuation of said needle-arm to carry the tying-cord toward said shuttle mechanism to form a loop about the folded portion of the bag, means for causing rotation of said shuttle mechanism to dispose the ends of said formed loop within the thimble-slot across the wire therein, and means for causing rotation of said thimble to cause said wire to be twisted about the ends of said loop close to the folded part of the bag.

24. In a bag-tying machine, the combination with a thimble having a longitudinal slot extending to its center, of a needle-arm normally disposed to one side of said thimble for carrying tying-cord, rotary shuttle mechanism disposed at the other side of said thimble, said tying-cord normally passing through the needle-eye and by the end of said thimble-slot, the end of said cord being held by said shuttle mechanism, means for folding the mouth of a filled bag and disposing the folded portion before the end of the thimble-slot and against the tying-cord, means for causing actuation of said needle-arm to carry the tying-cord toward said shuttle mechanism to form a loop about the folded portion of the bag, means for causing rotation of said shuttle mechanism to dispose the ends of said formed loop within the thimble-slot, there being a passage-way near the forward end of said thimble extending radially into said slot for receiving a wire, a stationary member before said slot having an opening for receiving the end of said wire, and means for causing rotation of said thimble, whereby said wire is twisted about the ends of the loop close to the folded part of the bag.

25. In a bag-tying machine, the combination with a thimble having a longitudinal slot extending radially to its center, of a needle-arm normally disposed to one side of said thimble for conveying tying-cord, rotary shuttle mechanism disposed at the other side of said thimble, said tying-cord normally passing through the needle-eye and by the end of said thimble-slot, the end of said cord being held by said shuttle mechanism, means for folding the mouth of a filled bag and disposing the folded portion before the end of the thimble-slot and against the tying-cord, means for causing actuation of said needle-arm to carry the tying-cord toward said shuttle mechanism to form a loop about the folded portion of the bag, means for causing rotation of said shuttle mechanism to dispose the ends of said formed loop within the thimble-slot, there being a passage-way near the forward end of said thimble extending radially and forwardly through said bearing and thimble, a plate secured to said bearing extending forwardly before the mouth of the thimble-slot, said plate having an opening for securing the end of a feed-wire extending through said radial passage-way, means for causing rotation of said thimble to shear from said feed-wire the part within the thimble, and means for causing said part to be twisted about the ends of the loop disposed within said slot.

27. In a bag-tying machine, the combination with a thimble having a longitudinal slot extending radially to its center, of a bearing in which said thimble may rotate, said bearing having a horizontal slot adapted to register with said thimble-slot, a needle-arm normally disposed at one side of said thimble for conveying tying-cord, rotary shuttle mechanism at the other side of said thimble, said tying-cord normally passing through the needle-eye and disposed before the mouth of said thimble-slot, the end of said cord being secured to said shuttle, means for folding the mouth of a filled bag and disposing the folded portion before the mouth of the thimble-slot and against the cord, means for causing rotation of said needle-arm toward said shuttle to form a loop of tying-cord about the folded part of the bag, means for causing rotation of the shuttle mechanism to carry the ends of the loop through the bearing-slot and into the thimble-slot and to tighten the loop, there being a passage-way near the mouth of said thimble-slot extending radially and forwardly through the walls of said bearing and said thimble for receiving a wire, an end plate secured to said bearing and disposed before the mouth of the thimble-slot, said plate having an opening for securing the end of said wire extending through said passage-way, means for causing rotation of said thimble to shear from said wire the part within the thimble and to twist said part about the ends of the loop within said slot.

28. In a bag-tying machine, the combination with a thimble having a longitudinal slot extending radially to its center, of a bearing in which said thimble may rotate, said bearing having a horizontal slot adapted to register with said thimble-slot, a needle-arm normally disposed at one side of said thimble for conveying tying-cord, rotary shuttle mechanism at the other side of said thimble, said tying-cord normally passing through the needle-eye and disposed before the mouth of said thimble-slot, the end of said cord being secured to said shuttle, means for folding the mouth of a filled bag and disposing the folded portion before the mouth of the thimble-slot and against the cord, means for causing rotation of said needle-arm toward said shuttle to form a loop of tying-cord about the folded part of the bag, means for causing rotation of the shuttle mechanism to carry the ends of the loop through the bearing-slot and into the thimble-slot and to tighten the loop, there being a passage-way near the mouth of said thimble-slot extending radially and forwardly through the walls of said bearing and said thimble for receiving a wire, an end plate secured to said bearing and disposed before the mouth of the thimble-slot, said plate having an opening for securing the end of said wire extending through said passage-way, means for causing rotation of said thimble to shear from said wire the part within the thimble and to twist said part about the ends of the loop within said slot, and means for severing the loop from the remainder of the cord after said wire is twisted.

29. In a bag-tying machine, the combination with a thimble having a longitudinal slot extending radially to its center, of a bearing in which said thimble may rotate having a horizontal slot adapted to register with said thimble-slot, a needle-arm normally disposed at one side of said thimble for conveying tying-cord, rotary shuttle mechanism at the other side of said thimble, said tying-cord normally passing through the needle-eye and disposed before the mouth of said thimble-slot, the end of said cord being secured to said shuttle, means for folding the mouth of a filled bag and for disposing the folded portion before the mouth of the thimble-slot and against the cord, means for causing rotation of said needle-arm toward said shuttle to form a loop of tying-cord about the folded part of the bag, means for causing rotation of the shuttle mechanism to carry the ends of the loop through the bearing-slot and into the thimble-slot and to tighten the loop, there being a passage-way near the mouth of said thimble-slot extending radially and forwardly through the walls of said bearing and said thimble for receiving a wire, an end plate secured to said bearing and disposed before the mouth of the thimble-slot, said plate having an opening for securing the end of said wire extending through said passage-way, teeth at the rear end of said thimble, a gear engaging said teeth for causing rotation of said thimble to shear from said feed-wire the part within the thimble and to twist said part about the ends of the loop disposed in said thimble-slot, and a knife secured to said gear-wheel adapted after said wire part is twisted about said loop to sever said loop from the remainder of the cord.

30. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm normally disposed at one side of the folded part of the bag for carrying tying-cord, shuttle mechanism disposed at the other side of said folded part, said tying-cord normally extending from the end of said needle-arm and passing by one side of said folded part, the end of said cord being secured to said shuttle mechanism, a stationary segmental part for said shuttle mechanism having an annular ridge provided with a groove, a rotatable disk disposed over said ridge, teeth on said disk adapted to enter said groove, means for causing said needle-arm to loop said cord about the folded part of the bag and to dispose the cord before the mouth of said groove, means for causing rotation of said disk, whereby a tooth engages the cord conveyed before said groove by said needle-arm to clamp said cord and to tighten the loop about said folded part, and means for twisting a wire about the ends of the loop.

31. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm normally disposed at one side of the folded part of the bag for carrying tying-cord, shuttle mechanism disposed at the other side of said folded part, said tying-cord normally extending from the end of said needle-arm and passing by one side of said folded part, a stationary segmental part for said mechanism having an annular ridge provided with a groove, a rotatable disk disposed over said ridge, teeth on said disk adapted to enter said groove, means for causing said needle-arm to loop said cord about the folded part of the bag and to dispose the cord before the mouth of said groove, means for causing rotation of said disk, whereby a tooth engages the cord conveyed before said groove by said needle-arm to clamp said cord and to tighten the loop about said folded part, means for twisting a wire about the ends of the loop, and means for severing the tied loop from the remainder of the cord.

32. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm normally disposed at one side of the bag, for carrying tying-cord, shuttle mechanism disposed at the other side of the bag, a normally stationary part for said shuttle mechanism having an annular groove, a rotatable disk disposed above said groove, teeth extending from said disk adapted to enter and pass through said groove, said tying-cord normally passing through the needle-eye and clamped at its end in said groove by one of said teeth, said cord being normally disposed at one side of the folded part, means for causing rotation of the needle-arm to form a loop about the folded part of the bag and to convey the cord before the mouth of said groove, means for causing rotation of said disk, whereby a tooth engages the cord before the groove and carries the cord to be clamped between the groove and disk, further rotation of the disk causing the loop to be tightened about the folded portion of the bag, and means for twisting wire about the loop ends close to the folded part of the bag.

33. In a bag-tying machine, the combination with a thimble having a horizontal slot extending radially to its center, of a needle-arm normally disposed at one side of said thimble for conveying tying-cord, shuttle mechanism disposed at the other side of said thimble, a stationary segmental part for said shuttle mechanism having an annular groove, a rotatable disk disposed above said segmental part, teeth extending from said disk adapted to enter and to pass through said groove, said tying-cord normally passing through the needle-eye and before the mouth of said thimble-slot, the end of said cord being clamped before one tooth between said disk and segmental part, means for folding the mouth of a filled bag and disposing the folded part before the mouth of said thimble and before said cord, means for causing rotation of said needle-arm to form a loop about said folded part and to convey the cord before the mouth of said annular groove, means for causing rotation of said disk, whereby another tooth engages the cord conveyed by the needle-arm to clamp said cord between the disk and segmental part, continued rotation of said disk causing both said teeth to carry the ends of the formed loop into said thimble-slot and to tighten said loop, and means for causing rotation of said thimble to twist a wire in said thimble about said loop ends adjacent to the folded part of the bag.

34. In a bag-tying machine, the combination with a thimble having a horizontal slot extending radially to its center, of a needle-arm normally disposed at one side of said thimble for conveying tying-cord, shuttle mechanism disposed at the other side of said thimble, a stationary segmental part for said shuttle mechanism having an annular groove, a rotatable disk disposed above said segmental part, teeth extending from said disk adapted to enter and to pass through said groove, said tying-cord extending through the needle-eye and before the mouth of said thimble-slot, the end of said cord being clamped before one tooth between said disk and segmental part, means for folding the mouth of a filled bag and disposing the folded part before the mouth of said thimble and before said cord, means for causing rotation of said needle-arm to form a loop about said folded part and to convey the cord before the mouth of said annular groove, means for causing rotation of said disk, whereby another tooth engages the cord conveyed by the needle-arm to clamp said cord between the disk and segmental part, continued rotation of said disk causing both said teeth to carry the ends of the formed loop into said thimble-slot and to tighten said loop, said thimble having a wire extending therefrom, means for causing rotation of said

thimble to twist said wire about said loop ends adjacent to the folded part of the bag, and means for severing the tied loop from the remainder of the cord.

35. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm for conveying tying-cord, a thimble having a longitudinal slot disposed before the folded part of the bag, a bearing in which said thimble may rotate, said bearing having a longitudinal slot adapted to register with said thimble-slot, a needle-arm normally disposed at one side of said thimble for conveying tying-cord, rotary shuttle mechanism at the other side of said thimble, said tying-cord normally passing through the needle-eye and disposed before the mouth of said thimble-slot, the end of said cord being secured to said shuttle, means for folding the mouth of a filled bag and disposing the folded portion before the mouth of the thimble-slot and against the tying-cord, means for causing actuation of said needle-arm to carry the tying-cord toward said shuttle mechanism to form a loop about the folded portion of the bag, means for causing rotation of said shuttle mechanism to carry the ends of the loop through the bearing-slot and into the thimble-slot and to tighten the loop, there being a passage-way near the mouth of said thimble-slot extending radially and forwardly through the walls of said bearing and said thimble for receiving a wire, an end plate secured to said bearing and disposed before the mouth of the thimble-slot, said plate having an opening for securing the end of said wire extending through said passage-way, means for causing rotation of said thimble to shear from said wire the part within the thimble and to twist said part about the ends of the loop within said slot, and means for severing the loop from the remainder of the cord after said wire is twisted.

36. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm normally disposed at one side of the folded part of the bag for carrying tying-cord, shuttle mechanism disposed at the other side of said folded part, said tying-cord normally extending from the end of said needle-arm and passing by one side of said folded part, the end of said cord being secured to said shuttle mechanism, a stationary segmental part for said shuttle mechanism having an annular ridge provided with a groove, a rotatable disk disposed over said ridge, teeth on said disk adapted to enter said groove, means for causing said needle-arm to loop said cord about the folded part of the bag and to dispose the cord before the mouth of said groove, means for causing rotation of said disk, whereby a tooth engages the cord conveyed before said groove by said needle-arm to clamp said cord and to tighten the loop about said folded part, means for twisting a wire about the ends of the loop, and means for severing the tied loop from the remainder of the cord.

37. In a bag-tying machine, the combination with means for folding the mouth of a filled bag, of a needle-arm normally disposed at one side of the bag, for carrying tying-cord, shuttle mechanism disposed at the other side of the bag, a normally stationary part for said shuttle mechanism having an annular groove, a rotatable disk disposed above said groove, teeth extending from said disk adapted to enter and pass through said groove, said tying-cord normally passing through the needle-eye and clamped at its end in said groove by one of said teeth, said cord being normally disposed at one side of the folded part, means for causing rotation of the needle-arm to form a loop about the folded part of the bag and to convey the cord before the mouth of said groove, means for causing rotation of said disk, whereby a tooth engages the cord before the groove and carries the cord to be clamped between the groove and disk, further rotation of the disk causing the loop to be tightened about the folded portion of the bag, and means for twisting wire about the loop ends close to the folded part of the bag.

38. In a bag-tying machine, the combination with a thimble having a horizontal slot extending radially to its center, of a needle-arm normally disposed at one side of said thimble for conveying tying-cord, shuttle mechanism disposed at the other side of said thimble, a stationary segmental part for said shuttle mechanism having an annular groove, a rotatable disk disposed above said segmental part, teeth extending from said disk adapted to enter and to pass through said groove, said tying-cord normally passing through the needle-eye and before the mouth of said thimble-slot, the end of said cord being clamped before one tooth between said disk and segmental part, means for folding the mouth of a filled bag and disposing the folded part before the mouth of said thimble and before said cord, means for causing rotation of said needle-arm to form a loop about said folded part and to convey the cord before the mouth of said annular groove, means for causing rotation of said disk, whereby another tooth engages the cord conveyed by the needle-arm to clamp said cord between the disk and segmental part, continued rotation of said disk causing both said teeth to carry the ends of the formed loop into said thimble-slot and to tighten said loop, said thimble having a wire extending therefrom, means for causing rotation of said

Claim.—1. In a loom, angle-rods pivoted therein; arms secured on said angle-rods; a whip-roll secured on said arms; a crank-shaft; [illegible] and two stone-clamping devices connected with said members by screw-threads, one of the screw-threads for each clamping device

thimble to twist said wire about said loop ends adjacent to the folded part of the bag, and means for severing the tied loop from the remainder of the cord.

36. In a bag-tying machine, the combination with a thimble having a horizontal slot extending radially to its center, of a needle-arm normally disposed at one side of said thimble for conveying tying-cord, shuttle mechanism disposed at the other side of said thimble, a stationary segmental part for said shuttle mechanism having an annular groove, a rotatable disk disposed above said segmental part, teeth extending from said disk adapted to enter and to pass through said groove, said tying-cord extending through the needle-eye and before the mouth of said thimble-slot, the end of said cord being clamped before one tooth between said disk and segmental part, means for folding the mouth of a filled bag and disposing the folded part before the mouth of said thimble and before said cord, means for causing rotation of said needle-arm to form a loop about said folded part and to convey the cord before the mouth of said annular groove, means for causing rotation of said disk, whereby another tooth engages the cord conveyed by the needle-arm to clamp said cord between the disk and segmental part, continued rotation of said disk causing both said teeth to carry the ends of the formed loop into said thimble-slot and to tighten said loop, a wire in said thimble, teeth at the rear end of said thimble, a gear-wheel engaging said teeth for causing rotation of said thimble to twist a wire passing through said thimble spirally about the ends of said cord-loop, and a knife secured to said gear-wheel adapted after said wire is twisted about the loop ends to cut said loop from the remainder of the cord.

37. In a bag-tying machine, the combination with hooks for suspending the distended bag, means for causing said hooks to converge to fold the mouth of the filled bag, means for holding the folded part in position after folding, means for releasing the hooks from the folded bag, means for forming a loop of tying-cord about the folded part, and means for twisting a wire about the ends of the loop adjacent to the folded part.

38. In a bag-tying machine, the combination with hooks from which the distended bag is suspended, means for converging said hooks to fold the mouth of the filled bag, means for holding the folded part in position after folding, shields for said hooks adapted to push the bag from the hook-points after folding thereof, means for forming a loop of tying-cord about the folded part, and means for spirally twisting a wire about the ends of the loop adjacent to the folded part.

39. In a bag-tying machine, the combination with a supporting-frame, of a stationary transverse bar at the front part thereof, longitudinal bars extending across said transverse bar, link members connecting said longitudinal bars with the machine-frame, a cross-head at the end of said supporting-frame, a driving-shaft pivoted in said frame, a cam mounted on said driving-shaft, and cam-levers connected with said cross-head and said cam, rotation of said shaft causing rotation of said cam to move the cross-head rearwardly whereby the longitudinal bars are brought toward each other and moved rearwardly, hooks supported from said longitudinal bars in front of said cross-arms for receiving a bag, the mouth of said bag being folded toward the center upon closure of said longitudinal bars.

40. In a bag-tying machine, the combination with hooks from which the distended bag is suspended, means for converging said hooks to fold the mouth of the filled bag, and means for severing the tied loop from the remainder of the cord.

41. In a bag-tying machine, the combination with hooks from which the distended bag is suspended, means for converging said hooks to fold the mouth of the filled bag, means for raising the bag during the folding operation, means for tying the folded part of the bag, means after tying for releasing the bag from the hooks, and means after releasing the bag from the hooks for again lowering said bag to its normal position.

42. In a bag-tying machine, the combination with hooks from which the distended bag is suspended, a platform for holding the filled bag, means for causing the hooks to move together to fold the mouth of the bag toward the center thereof, means for raising said platform with the bag during the folding operation, means for tying the bag after folding thereof, means for releasing the bag from the hooks, and means for thereafter lowering said platform to carry the bag to its normal position.

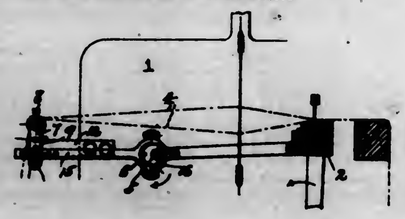
43. In a bag-tying machine, the combination with a supporting-frame, of a stationary cross-bar thereon, longitudinal parallel cross-bars cooperating with said transverse bar, a cross-head connected with said longitudinal bars, a driving-shaft pivoted in said frame, a cam mounted on said driving-shaft, a cam-arm associated with said cam and connected with said cross-head, hooks suspended from the longitudinal bars in front of said cross-bar for supporting the bag to be filled, a platform below the bag, lever mechanism connecting said platform with said cam-arm, actuation of said driving-shaft causing rotation of said cam to move the cross-head to carry the longitudinal arms toward each other and toward the cross-bar whereby said hooks are brought together to fold the mouth of the bag, said platform during said folding operation being moved by said lever mechanism to raise the bag, and means for tying the bag after folding thereof, further rotation of said cam allowing release of said longitudinal members and of said platform whereby the tied bag is released from the hooks and returned to its normal position.

44. In a bag-tying machine, the combination with a transverse bar, of longitudinal parallel bars extending across said transverse bar, bearing-boxes adapted to slide on said cross-bar and through which said longitudinal bars may slide, supporting-hooks suspended from said boxes, supporting-hooks suspended from said longitudinal bars in front of said transverse bar, sleeves passing over said longitudinal bars and through said boxes, supporting-hooks suspended from said sleeves, means for causing said longitudinal bars to be moved rearwardly and parallelly toward each other whereby the hooks are brought together and whereby the mouth of a bag suspended from said hooks is folded at the center of the bag.

45. In a bag-tying machine, the combination with supporting-bars, of hooks suspended from said bars, a shield over each hook normally disposed to allow application of a distended bag to the hooks, means for causing said bars to be moved together to fold the mouth of the bag, and means upon such movement of the bars for causing the shields on the hooks to be engaged to push the bag from the hooks.

46. In a bag-tying machine, the combination with a stationary transverse bar, of longitudinal parallel bars extending across the transverse bar, hooks suspended from said longitudinal bars in front of the transverse bar, a shield for each hook, said shields being normally disposed to permit application of a bag to the hooks, means for causing said longitudinal bars to be moved rearwardly and parallelly together to fold the mouth of the bag, the shields of the hooks on one longitudinal bar being engaged by the opposite longitudinal bar upon closure of the bars to cause the bag to be pushed from the hooks whereby said bag is released.

813,883. MEANS FOR REGULATING THE TENSION UPON WARP-THREADS OF LOOMS. WILLIAM H. RYDER, Providence, R. I. Filed Mar. 28, 1903. Serial No. 251,671.



Claim.—1. In a loom, angle-rods pivoted therein; arms secured on said angle-rods; a whip-roll secured on said arms; a crank-shaft; an eccentric actuated thereby; a strap having a connection between said eccentric and one of said arms, and said eccentric and strap having a clearance therebetween.

2. In a loom, in combination with the lay having an operating crank-shaft, of pivotal angle-rods properly supported on the loom-frame; arms secured on said angle-rods, beneath their pivot centers; a whip-roll secured in the upper part of said arms; an eccentric secured upon the crank-shaft; a strap on said eccentric having a connection with the lower part of one of said arms, arranged to partially operate the whip-roll by the crank-shaft, and said eccentric and strap having a clearance therebetween to permit the tension of the warp-threads to complete the operation, substantially as set forth.

3. In a loom, in combination with the lay having an operating crank-shaft, of fixed brackets; supports mounted in said brackets and having bifurcated upper ends; arms; a whip-roll secured on said arms; angle-rods having one portion secured in said arms and the other portion mounted in the bifurcated ends of said supports; an eccentric secured upon the crank-shaft; a strap having a connection from said eccentric to an extension integral with one of said arms, and said strap being of greater diameter interiorly than the exterior of the eccentric to provide a clearance therebetween, substantially as set forth.

4. In a loom, a shaft, an eccentric actuated thereby, a movable whip-roll, and a connection between said whip-roll and eccentric, said connection and eccentric having a clearance therebetween.

5. In a loom, a lay, a whip-roll mounted on movable bearings, a lay-operating shaft, and connection between said whip-roll and lay-operating shaft for operating the whip-roll, comprising an eccentric and an eccentric-strap having a clearance between them.

6. In a loom, a whip-roll mounted on arms, pivotal connections between the arms and the frame of the loom, and means to operate said whip-roll comprising an eccentric and connection between the whip-roll and the eccentric having a clearance therebetween.

7. In a loom, the combination with the lay and the lay-operating means, of a swinging whip-roll, and connection between the lay-operating means and the whip-roll comprising an eccentric and an eccentric-strap having a clearance therebetween.

813,884. WOOD-GRINDER. THOMAS H. SAVERY, Wilmington, Del. Filed Apr. 18, 1903. Serial No. 153,054.

Claim.—1. A grinder comprising a shaft, a member connected with the shaft by a screw-thread and movable by such screw-thread along the shaft to increase the clamping pressure as the latter rotates, and a stone-clamping device connected with said member by a screw-thread, one of said screw-threads being tapered, substantially as described.

2. A grinder comprising a shaft, a member connected with the shaft by a screw-thread and movable by such screw-thread along the shaft to increase the clamping pressure as the latter rotates, and a stone-clamping device connected with said member by a tapering screw-thread, substantially as described.

3. A grinder comprising a shaft, a member connected with the shaft by a screw-thread and movable by such screw-thread along the shaft to increase the clamping pressure as the latter rotates, and a stone-clamping device connected with said member by a tapering screw-thread, said member being split, substantially as described.

4. A grinder comprising a shaft, a member connected with the shaft by a straight screw-thread and movable by such screw-thread along the shaft to increase the clamping pressure as the latter rotates, and a stone-clamping device connected with said member by a tapering screw-thread, said member being split, substantially as described.

5. A grinder comprising a shaft, two members connected with the shaft by right and left hand screw-threads and movable by such screw-threads along the shaft and toward each other as the shaft rotates, and two stone-clamping devices connected with said members by screw-threads, one of the screw-threads for each clamping device being tapered, substantially as described.

6. A grinder comprising a shaft, two members connected with the shaft by right and left hand screw-threads and movable by such screw-threads along the shaft and toward each other as the shaft rotates, and two stone-clamping devices connected with said members by tapering screw-threads, substantially as described.

7. A grinder comprising a shaft, two members connected with the shaft by right and left hand screw-threads and movable by such screw-threads along the shaft and toward each other as the shaft rotates, and two stone-clamping devices connected with said members by tapering screw-threads, said members being split substantially as described.

8. A grinder comprising a shaft, a member connected with the shaft by a screw-thread, and movable by such screw-thread along the shaft to increase the clamping pressure as the latter rotates, and a stone-clamping device connected with said member by a screw-thread, substantially as described.

9. A grinder comprising a shaft, two members connected with the shaft by right and left hand screw-threads and movable by such screw-threads along the shaft and toward each other as the shaft rotates, and two stone-clamping devices connected with said members by screw-threads, substantially as described.

10. A grinder comprising a shaft, a member connected with the shaft by a screw-thread and movable by such screw-thread along the shaft to increase the clamping pressure as the latter rotates, and a stone-clamping device connected with said member by a screw-thread, said member being split, substantially as described.

813,885. DANDY-ROLL. JOHN R. SINCLAIR, Holyoke, Mass. Filed Nov. 19, 1904. Serial No. 233,429.

Claim.—A dandy-roll consisting of end heads, one of which is essentially apertured, a wire or strip, cross-sectionally of the form of an elongated rectangle and of comparatively slight thickness, wound into a succession of helixes, and with such so-wound strip arranged with its larger cross-sectional dimension substantially radial to the roll center with its convolutions separated, and extending from one end head to the other, wires engaging the outer edges of the flat-strip helixes, and extending from end to end of the roll on gradually-sweeping helical lines, longitudinal wires, a winding-wire and a wire-gauze covering whereby is produced within and throughout the length of the roll a spiral channel having smooth parallel sides and its base or side uniting portion constituted by the aforesaid helical strip-supported wires and gauze covering, and the walls of said continuous spiral channel offering but a minimum of obstruction to the endwise progression of accumulations within the dandy-roll.

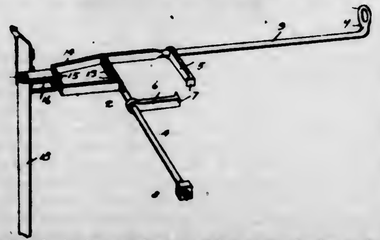
813,886. SHADOW-CLOCK. RICHARD B. BOYCE, New York, N. Y.

813,836. SHADOW-CLOCK. RICHARD B. SMITH, New York, N. Y. Filed Apr. 3, 1905. Serial No. 253,706.

Claim.—1. In an apparatus of the class described, a going-train having a member provided with studs, another train including a fly and a notched locking-disk, a double-armed locking-lever provided with projections adapted to engage, respectively, with said locking-disk and with a projection on the fly, an operating-lever in the path of the projections on said member of the going-train, an intermediate lever operatively related to the aforesaid levers, condensing and projecting lenses, a source of light, transparent time-indicating means intermediate of said lenses and actuated by the going-train, and a panel-carrier operating between the lenses and operated at intervals by the second-named train.

2. In an apparatus of the class described, condensing and projecting lenses, a source of light, a rotary toothed panel-carrier equipped with a plurality of transparent panels and arranged to present said panels successively between said lenses, transparent time-indicating disks operating between the lenses, a going-train adapted to operate said disks, said train including a member provided with studs, an operating-lever actuated by said studs, another train geared to the toothed panel-carrier, said last-mentioned train including a locking-disk and a fly, a locking-lever having two members arranged to engage, respectively, with said locking-disk and the fly of the last-mentioned train, and a lever intermediate of the operating and locking levers for releasing the train to operate the panel-carrier at intervals.

813,837. WIRE-STRETCHER. JOHN S. SNYDER and MOSE A. SNYDER, New Lexington, Pa. Filed Aug. 7, 1905. Serial No. 273,157.



Claim.—1. A wire-stretcher comprising an angular frame, dogs slidable upon the angularly-disposed members of said frame and adapted to engage a post or the like, a guide upon one of said members, a lever pivotally mounted upon the other of said members, a flexible connection passed through said guide and engaged with said lever, a wire-attaching device upon one end of said flexible connection, and means for holding said chain in an adjusted position, substantially as described.

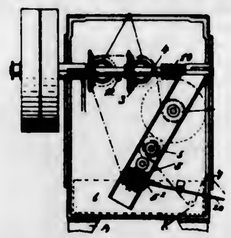
2. A wire-stretcher comprising a frame having substantially right-angularly-extending members, dogs slidable upon said members and formed with prongs to engage a post or the like, stops upon the outer ends of said members, one of said stops being formed with a guide-aperture, a bracket upon one of said members, a lever pivoted to said bracket and having a hooked end, a chain or the like engaged with the hook of said lever and passing through the guide-aperture in said stop, a clamping device upon one end of said chain and a locking-pin adapted to be passed through one of the links of said chain and into an aperture in one of said members, substantially as described.

813,838. CLASP. ISAAC STEINBERG, Nashville, Tenn., assignor to Hercules Safety Clasp Company, Nashville, Tenn., a Corporation of Tennessee. Filed May 9, 1905. Serial No. 259,499.

Claim.—1. In a clasp and in combination, a casing provided with a horizontal slit at one end thereof, an arched spring secured at one end to the bottom of the casing adjacent to the slit, a hook on the rise of the arch adjacent to the slit, a button secured to the rise of the arch adjacent to the free end of the spring and projecting through the upper face of the casing, and a slide traversing the slit in the casing and provided with an opening to engage the hook.

2. In a clasp, the combination of a casing, provided with an opening at one of the ends thereof, an arched spring secured at one end to the bottom of the casing adjacent to the opening, a slide traversing the opening on the casing, means actuated by the spring to engage the slide, and means without the casing for depressing the spring to release the engaging means.

813,839. POLISHING-MACHINE. FRANK TERRANOVA, San Francisco, Cal. Filed Jan. 21, 1905. Serial No. 242,006.



Claim.—1. An apparatus for abrading and polishing the surface of cloth, comprising revoluble rollers having an abrasive surface, rollers upon which independent rolls of cloth may be supported, means whereby the last-named rolls are caused to respectively rotate in the same directions to simultaneously wind and unwind the cloth, and means whereby the cloth may be drawn over the abrading-rollers from either of the cloth-supporting rollers.

2. In an apparatus for abrading and polishing cloth, revoluble rollers having an abrading-surface, mechanism by which the rollers are revolved, a plurality of rollers upon which lengths of cloth are first wound, either of said last-named rollers adapted to deliver the cloth to the abrading-rollers, means for rotating the last-named rollers simultaneously and in the same direction whereby the cloth is wound upon one roller and simultaneously unwound from the other roller, means for moistening the cloth before and during the operation, and means for retarding the movement of the cloth over the abrading-rollers.

3. In an apparatus for polishing cloth, revoluble rollers having abrading-surfaces, mechanisms by which said rollers are revolved, other rollers upon which the cloth is first coiled, a water-tank, guide-rollers over which the cloth is passed through the tank before being thus coiled, a supplemental spraying device located contiguous to the abrading-rollers, and a receiving-drum and mechanism by which it is revolved in unison with the movement of the abrading-rollers and in the same direction.

813,840. INSULATED RAIL-JOINT. McLEOD W. THOMSON, Altoona, Pa., assignor of one-half to Andrew Morrison, Pittsburg, Pa.; William Paton Thomson and Samuel Garver Thomson executors of said McLeod W. Thomson, deceased. Filed Apr. 10, 1902. Serial No. 102,956.

Claim.—1. An insulated rail-joint having opposite splice-bars, the halves of said bars on the same side of said joint being respectively insulated and uninsulated; substantially as described.

2. An insulated rail-joint having opposite splice-bars, the inner faces on one side of the joint being insulated and the corresponding faces on the other side of the joint being uninsulated; substantially as described.

3. An insulated rail-joint having opposite splice-bars, the portion of said bars on the same side of the joint being planed or recessed to admit of insulating material; substantially as described.

4. An insulated rail-joint having splice-bars provided with depending flexible flanges inclined inwardly at about forty-five degrees, and having flat inner faces, a triangular block of resilient material below the rail-bases and within the flanges, and cross-bolts or fastenings below the middle of the block and arranged to draw the flanges toward each other to force the block upwardly; substantially as described.

5. An insulated rail-joint having splice-bars with depending flanges inwardly inclined, a wooden block below the rail-bases and between the depending flanges, and cross-bolts or fastenings arranged to draw the flanges toward each other and force the block upwardly; substantially as described.

6. An insulated rail-joint having splice-bars with depending flanges inwardly inclined, a wooden block below the rail-bases and between the depending flanges, a metal plate seated on the block under the end portion of one rail only, and cross-bolts or fastenings arranged to draw the depending flanges toward each other and force the block upwardly; substantially as described.

7. An insulated rail-joint having splice-bars with depending flanges inwardly inclined, a triangular wooden block below the rail-bases and between the flanges, a metal plate seated in a recess in the block, and cross-bolts or fastenings arranged to draw the depending flanges toward each other; substantially as described.

8. An insulated rail-joint having splice-bars with depending inwardly-inclined flanges, a wooden block below the end portions of both rails and within the flanges, and a layer of insulating material between the wooden block and the rail-base; substantially as described.

9. An insulated rail-joint having splice-bars with depending inwardly-inclined flanges, a triangular wooden block below the rail-bases and between the flanges, a layer of insulating material upon the wooden block, and a metal plate in the recess of the block under the end portion of one rail only; substantially as described.

10. In an insulated rail-joint, an insulating-support extending below the rail ends, insulation thereon, a metallic protecting-plate between the same and the base of at least one of the rails, and insulating means for maintaining the rails in alinement; substantially as described.

11. In an insulated rail-joint, a resilient, insulating-support extending below the ends of the rails and having thereon a metallic plate below the base of at least one rail, insulation between said plate and the support, and insulating means for maintaining the rails in alinement and electrically separating their ends; substantially as described.

12. An insulated rail-joint having inclined depending flanges, a triangular block between said flanges, and bolts or other fastening means arranged to pass through said block and flanges to draw said flanges toward each other and force the block against the base of the rail; substantially as described.

13. An insulated rail-joint provided with inwardly-depending flanges having straight inner faces inclining with the base of the rail a triangular space, a wooden block in said space having a metal plate secured to the top face thereof, and bolts or other fastening means securing said flanges together and holding said block against the rail; substantially as described.

813,841. METHOD OF TREATING CEMENT AND CEMENT CONSTRUCTION. MAXIMILIAN TOCH, New York, N. Y., assignor of one-half to Henry M. Toch, New York, N. Y. Filed Oct. 13, 1905. Serial No. 282,886.

Claim.—1. The method of treating Portland-cement constructions which consists in applying to the surface of the cement a suitable organic acid or acid body, substantially as described.

2. The method of treating Portland-cement constructions which consists in applying to the surface of the cement a solution containing an acid resin, substantially as described.

3. The method of treating Portland-cement constructions which consists in applying to the surface of the cement a solution containing an acid resin and the vegetable drying-oil, substantially as described.

4. The method of treating Portland-cement constructions which consists in applying to the surface of the cement a solution containing an acid resin, a vegetable drying-oil and a diluent, substantially as described.

5. The method of treating Portland-cement constructions which consists in applying to the surface of the cement a suitable organic acid or acid body, and then applying a mixture containing a pigment, substantially as described.

6. The method of treating Portland-cement constructions which consists in applying to the surface of the cement a suitable organic acid or acid body, and then applying a mixture containing a dissolved resin and a pigment.

7. The method of treating Portland-cement constructions which consists in applying to the surface of the cement a solution containing an acid resin, a vegetable drying-oil and a diluent, and then applying a mixture containing a dissolved resin and a pigment, substantially as described.

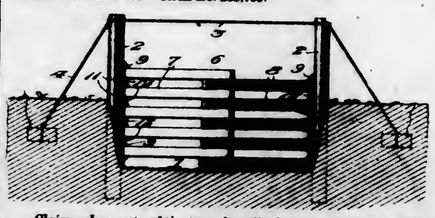
8. An oil and water proof Portland-cement construction superficially treated with an organic acid or acid body, substantially as described.

9. An oil and water proof Portland-cement construction containing a compound of a resin acid, substantially as described.

10. An oil and water proof Portland-cement construction having a surface layer containing a compound of a resin acid, substantially as described.

11. An oil and water proof Portland-cement construction having a surface layer containing calcium resinate, substantially as described.

813,842. FLOOD-GATE. LEVERETT W. TRAVIS, Martin, Tenn. Filed Oct. 21, 1905. Serial No. 283,780.



Claim.—In a gate of the type described, a pair of posts or standards, two sets of cooperating gate members arranged in vertically-spaced relation and in relative staggered order, said sets of members being adapted for arrangement with their outer ends in overlapping superposed condition, and means for pivotally connecting the sets of members with their respective posts, said pivoting means comprising an element threaded through the set of sections, and fastening members for attaching the element to the post at points between the sections.

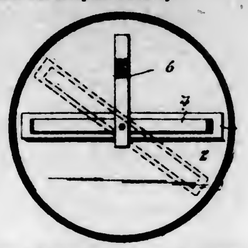
813,843. PUNCH. EDWIN D. TOOKER, Santa Barbara, Cal. Filed May 23, 1905. Serial No. 261,857.

Claim.—1. In a device of the character described, a receptacle, a spring member having one of its ends rigidly secured to the receptacle, and a punch secured to the free end of said spring member, whereby to permit the punch being withdrawn and replaced in a perforation made in the receptacle thereby.

2. In a device of the character described, a receptacle, a spring member having one of its ends rigidly secured to the receptacle, and a punch movably secured to the free end of said spring member, whereby to permit the punch being removed and replaced in a perforation made in the receptacle thereby.

3. In a device of the character described, a receptacle, a spring

member having one of its ends rigidly secured to said receptacle, and a double-pointed punch secured to the free end of said spring member, whereby to permit the punch being withdrawn and replaced in perforations made in the receptacle thereby.



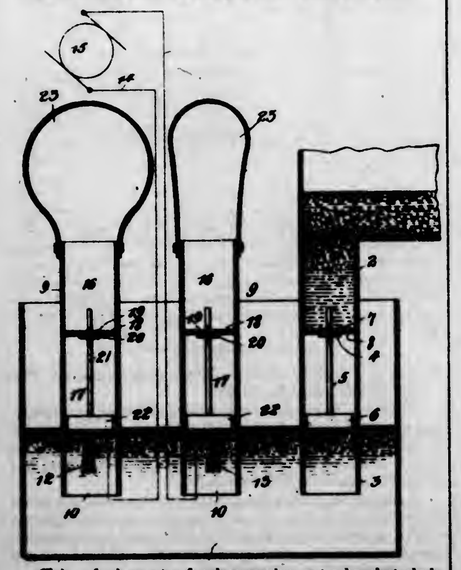
4. In a device of the character described, a receptacle, a spring member having one of its ends rigidly secured to said receptacle, a punch secured to the free end of said spring member, whereby to permit of its being removed and replaced in a perforation made in the receptacle thereby, and a sealing means carried by the punch.

5. In a device of the character described, a receptacle, a spring member having one of its ends rigidly secured to said receptacle, and a punch secured to the free end of said spring member, the end of said spring member projecting beyond the punch to provide a handle by means of which the punch may be removed and replaced in a perforation made in the receptacle thereby.

6. In a device of the character described, a receptacle having the top thereof provided with indentations, a spring-retaining member secured to the top thereof, a punch movably secured to said retaining member and provided with points adapted to normally occupy said indentations, means for preventing said punch from accidentally penetrating the bottoms of said indentations, and a sealing member secured to said punch.

7. In a device of the character described, a receptacle provided with an indentation, a yielding member secured to the receptacle, a punch secured to the yielding member and provided with a point adapted to be seated in said indentation, a seal means carried by the punch, and means carried by the punch for preventing the point thereof from accidentally penetrating the bottom of said indentation.

813,844. **ELECTROLYTIC APPARATUS.** Leroy Van Scoyoc, Gilbert Station, Iowa. Filed May 15, 1905. Serial No. 260,479.

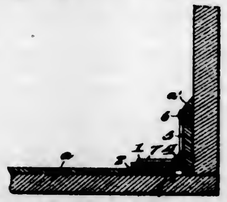


Claim.—1. Apparatus for decomposing water by electrolysis, comprising a receiver, means including a valve actuated by variations in the water-level in the receiver, to supply water to the latter, a gas-collector, electrodes in the receiver in suitable relationship to the gas-collector and a valve actuated by variations in the water-level in the receiver, to control the discharge of gas to the collector.

2. An electrolytic apparatus comprising a liquid-container, an automatic liquid-supply for maintaining the liquid in said container at a constant level, gas-collectors having their open lower ends projecting below the level of the liquid in said container, electrodes in said collectors, partitions in said collectors having valve-openings therein, and float-valves in said collectors and coacting with said valve-openings, substantially as described.

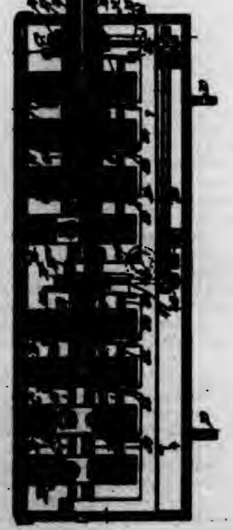
3. An electrolytic apparatus comprising a liquid-container, a liquid-supply therefor, a float-valve in said supply for containing the liquid at a constant level in said container, gas-collecting receptacles having their lower open ends submerged in said container, electrodes in said receptacles, partitions in said receptacles having valve-openings therein, float-valves in said receptacles and coacting with said valve-openings, and gas-bags at the upper open ends of said receptacles, substantially as described.

813,845. **CARPET-FASTENING.** George W. Voelkle, Collinsville, Tex. Filed June 2, 1905. Serial No. 263,450.



Claim.—The combination with a floor and washboard, of curved pins fixed to the floor and washboard, a clamping-strip having openings for the passage of the pins and pivotally mounted thereby upon the pins to swing between the floor and washboard, and holding devices pivoted to the washboard to swing in a direction longitudinally of the strip and having right-angularly-bent pressure-arms to engage and hold the strip in a horizontal position.

813,846. **ODOMETER.** Bernhard Volkmar, New York, N. Y., assignor to The Ajax Auto-Meter Company, New York, N. Y. Filed Sept. 6, 1905. Serial No. 277,212.

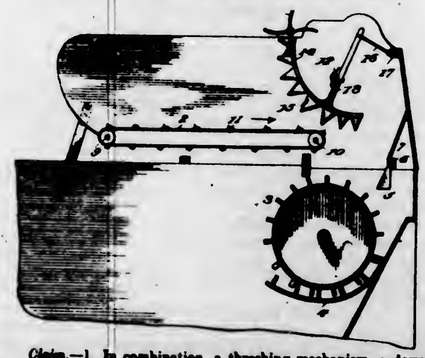


Claim.—1. In odometers, a casing, a carrying-shaft mounted for end and rotary movement in the casing, a set of registering-disks and a set of recording-disks loosely mounted on the said shaft, one set of disks being independent of the other and each disk in a set being independent of each other, each disk of both sets being provided with series of apertures in one of its faces, a ratchet-wheel loosely mounted on the said carrying-shaft adjacent to the initial disk of each set, spring latch-arms secured at one end to the face of each disk opposite that containing the apertures, a similar arm being similarly connected with each ratchet-wheel, each of the said latch-arms having a bevel foot-section formed at its free end, and posts on said foot-sections adapted to enter apertures in opposing disks, fixed spurs located in the path of the foot-sections of the said latch-arms, a line-shaft, means for driving the line-shaft, and independent dogs carried by said line-shaft, engaging the said ratchet-wheels.

2. In odometers, a casing, a carrying-shaft mounted for end and for rotary movement in the casing, a set of registering-disks and a set of recording-disks loosely mounted on the said shaft, one set of disks being independent of the other and each disk in a set being independent of each other, each disk of both sets being provided with series of apertures in one of its faces, a ratchet-wheel loosely mounted on said carrying-shaft adjacent to the initial disk of each set, spring latch-arms secured at one end to the face of each disk opposite that containing the apertures, a similar arm being similarly connected with each ratchet-wheel, each of the said latch-arms having a beveled foot-section formed at its free end, and posts on said foot-sections, adapted to enter apertures in opposing disks, fixed spurs located in the path of the foot-sections of the said latch-arms, a line-shaft common to both sets of disks, means for driving the line-shaft, eccentrics carried by the said line-shaft, and independent dogs carried by the said eccentrics, one dog being adapted for engagement with each ratchet-wheel.

3. In odometers, the combination with a casing, a carrying-shaft mounted for end and for rotary movement in the casing, a set of registering-disks loosely mounted on said shaft, a set of recording-disks likewise loosely mounted on the said shaft, the sets of disks being independent of each other, each disk having openings in one side face, a ratchet-wheel loosely mounted on the said shaft opposite the initial disk of each set, spring latch-arms attached to the faces of the disks opposite those provided with the openings and corresponding arms secured to the said disks, each latch-arm being provided with a beveled foot-section at its free end and posts extending from the said foot-sections, and a bar located below the disks and provided with spurs which are in the path of the free ends of the latch-arms as the disks and ratchet-wheels revolve, of pins extending from the faces of the registering-disks having the openings therein, sleeves frictionally mounted on the shaft, each registering-disk being adapted to turn loosely on a sleeve, each sleeve being provided with a finger to engage the pin of the disk to which it belongs, stops on the said shaft, whereby by moving the shaft endwise the disks are carried to and from the pin-faces of the said registering-disks, a line-shaft, cams carried by the line-shaft, means for rotating the line-shaft and dogs mounted on said cams, a dog being adapted for engagement with the ratchet-wheels of each set of disks, as described.

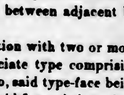
813,847. **BAND-CUTTER AND FEEDER.** Halbert C. Wallace, McPherson, Kans. Filed Jan. 13, 1906. Serial No. 240,800.



Claim.—1. In combination, a threshing mechanism, a downwardly and rearwardly inclined plate located above the threshing mechanism and at the rear side thereof, a transverse bar located a short distance from the lower edge of said plate, a second plate connected at its lower edge with said bar and inclined upwardly and rearwardly and forming a close joint at its upper edge with the first-mentioned plate, knives secured to said transverse bar, a feeder located forward of and above the threshing mechanism, and a band-cutter arranged above the delivery end of said feeder and acting jointly therewith to advance the grain and retard the upper portion thereof.

2. In combination, a threshing mechanism, a downwardly and rearwardly inclined plate located above the threshing mechanism and at the rear side thereof, a transverse bar located a short distance from the lower edge of said plate, a second plate connected at its lower edge with said bar and inclined upwardly and rearwardly and forming a close joint at its upper edge with the first-mentioned plate, knives secured to said transverse bar, a feeder located forward of and above the threshing mechanism, oscillatory band-cutters operating over the entrance to the threshing mechanism and above the delivery end of the feeder, and a rotary retarder located above the forward end of said oscillatory band-cutters.

813,848. **TYPE.** Kansas U. Whitted, Topeka, Kans. Filed Jan. 13, 1905. Serial No. 240,864.

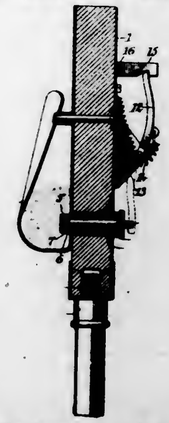


Claim.—1. The combination with a form having linotype-slugs with blank portions thereon, of an associate flanged type-face, said type-face being adapted to rest upon the blank portion of the slugs with the flange extending downwardly and clamped between adjacent slugs, substantially as set forth.

2. The combination with the product of type-casting or line-casting machines having bodies and faces and blank portions on the bodies, of an associate flanged type-face, said type-face being adapted to rest upon the blank portions with the flange extending downwardly and clamped between adjacent bodies, substantially as set forth.

3. The combination with two or more lines of type with blank portions, of an associate type comprising a thin type-face and a flange secured thereto, said type-face being adapted to rest upon the blank portions, and said flange being adapted to extend downwardly between contiguous lines of type so as to be held firmly in place in the lock-up, substantially as set forth.

813,849. **FLASH-LIGHT DEVICE.** Takenari Asuma, Kanda, Tokyo, Japan. Filed Aug. 11, 1905. Serial No. 273,733.



Claim.—1. A flash-light device comprising a body portion, a pan thereon open at the sides and top, the opening at the top being narrow, a tube extended removably through the body portion into the pan and adapted to receive an exploding medium, a plunger for operating in the tube, and a spring-actuated hammer for forcing the plunger against the igniting material.

2. A flash-light device, comprising a body portion, a pan thereon, a tube removably extended through the body portion and projected into the pan, the said tube having a slot through which an igniting medium may pass, a plunger operating in the tube, a spring-actuated hammer for striking the plunger, a holding-latch for said

813,851. **CORN CUTTER AND SHOCKER.** Elmer Berry and Homer A. Berry, Hebron, Ohio. Filed May 18, 1905. Serial No.

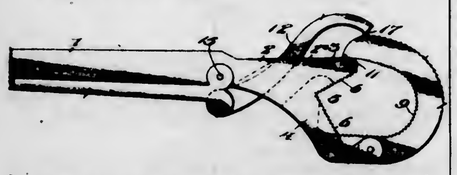
carriage slidably mounted on the track, a turn-table on the carriage, a cradle hinged to the turn-table, means for supporting the cradle from opposite ends of the tubular portion of the bill, a pin threaded

niting medium may pass, a plunger operating in the tube, a spring-actuated hammer for striking the plunger, a holding-latch for said hammer, and a pneumatic for releasing the latch from the hammer.

3. A flash-light device, comprising a body portion, a pan thereon having its outer wall inclined upward and inward, or toward the body portion, a tube removably extended through the body portion and into the pan, said tube having a slot through which an igniting medium may pass, a plunger operating in the tube, a spring-actuated hammer for striking the plunger, a latch for holding the hammer in one position, a lever on which said latch is mounted, a plate on the front end of the lever, an air-tube, and a cap movable on said air-tube for contact with said plate.

4. A flash-light device, comprising a body portion, a pan thereon, the said body portion having an opening leading into the pan, a tube for removably engaging in said opening and adapted to receive an igniting medium, a plunger operating in the tube, a plate on the outer end of said tube, buttons on the body portion for engaging the said plate, and a hammer for striking said plunger.

818,850. **WRENCH.** JOHN A. BARTON, Virginia, Minn. Filed Aug. 5, 1905. Serial No. 272,365.



Claim.—1. A wrench comprising a handle carrying a fixed jaw, a rigid, arcuately-curved movable jaw pivoted at one end to one side of the fixed jaw and adapted to bear when closed at its free end upon the opposite side of the fixed jaw, and a pivoted dog for engaging the free end of and locking the movable jaw in closed position.

2. A wrench comprising a handle carrying a Y-shaped fixed jaw, a U-shaped rigid movable jaw pivoted at one end to one member of the fixed jaw and adapted to bear at its free end upon the other member of the fixed jaw, and pivotally supported independent of the movable jaw for engaging the free end of the movable jaw to hold the same in closed position.

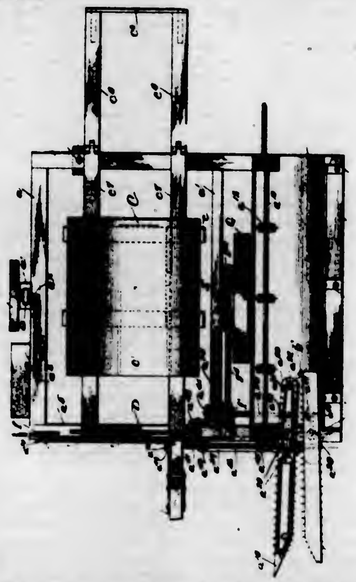
3. A wrench comprising a handle carrying a fixed jaw and provided with a transverse slot, a rigid, arcuately-curved movable jaw pivoted at one end to one side of the fixed jaw and adapted to bear at its free end upon the opposite side thereof, a lever pivoted to the handle on one side thereof, and a dog extending through said transverse slot and connected at one end to the handle and provided at its opposite end with a toothed terminal to interlock with the free portion of the pivoted jaw.

4. A wrench comprising a handle carrying a fixed jaw, a rigid arcuately-curved movable jaw pivoted at one end to one side of the fixed jaw and adapted to bear when closed at its free end upon the opposite side of the fixed jaw, a lever pivoted to the handle of the wrench, and a dog pivotally connected to the lever and adapted to engage the free end of and lock the movable jaw in closed position.

5. A wrench comprising a handle carrying a Y-shaped fixed jaw and provided with an oblique slot in rear thereof, a rigid arcuately-curved movable jaw linked at one end to one of the branches of the fixed jaw and adapted to bear at its free end against the other branch of the fixed jaw, a lever pivoted to one side of the handle, and a dog projecting through said oblique slot and pivotally connected at one end to the lever and provided at its other end with a tooth to engage the free end of and lock the movable jaw in closed position.

6. A wrench comprising a handle provided with a Y-shaped fixed jaw and an oblique slot in rear thereof, one of the branches of said fixed jaw having a bearing-face, a rigid arcuately-curved lever linked to the other branch of the fixed jaw and adapted to bear at its free end against said bearing-face, said movable jaw being provided with an inner set of serrations and an outer set of locking-teeth, a lever pivoted to the handle at the side of the wrench opposite the bearing-face, and a locking-dog pivotally connected at one end to the lever and extending beyond the opposite side of the wrench through said oblique slot and having an offset free end provided with a tooth to engage the locking-teeth of the movable jaw, said offset free end being adapted to permit the free end of the movable jaw to have movement between it and the bearing-face of the fixed jaw and enable the movable jaw to be freely adjusted.

818,851. **CORN CUTTER AND SHOCKER.** BLAINE BERRY and HOMER S. BERRY, Hebron, Ohio. Filed May 18, 1905. Serial No. 261,014.



Claim.—1. In a corn cutter and shocker, the combination of a frame, dividing-boards on the frame, a cutter between the dividing-boards, lug-chain conveyers on the dividing-boards, a pin for engaging the butts of the stalks at the inner ends of the dividing-boards, a trough beyond the dividing-boards on the frame, upright supports secured to the frames, shafts journaled in the ends of the supports, lug-chain conveyers on the shafts, horizontal bars secured to the supports, shafts journaled in the ends of the bars, lug-chain conveyers on the shafts, a track on the frame and beneath the free ends of the bars, a hinged extension on the track at the rear of the frame, brackets on the free ends of the hinged extension, caster-wheels journaled in the brackets, a carriage slidably mounted on the track, a turn-table on the carriage, a cradle hinged to the turn-table, a depressible shoe for supporting the rear end of the frame, a grain-wheel for supporting one side of the frame, means whereby the grain-wheel may be elevated and depressed, a bull-wheel for supporting the opposite side of the frame, means for elevating and depressing the frame with respect to the bull-wheel, and connections between the bull-wheel, the cutter and the conveyers, whereby the motion of the bull-wheel will operate the cutter and conveyers.

2. In a corn cutter and shocker, the combination of a frame, dividing-boards on the frame, a cutter between the dividing-boards lug-chain conveyers on the dividing-boards, a pin for engaging the butts of the stalk at the inner end of the dividing-boards, a trough behind the dividing-boards and on the frame, upright supports secured to the frame, shafts journaled in the ends of the supports, lug-chain conveyers on the shafts, horizontal bars secured to the supports, shafts journaled in the ends of the bars, lug-chain conveyers on the shafts, a track on the frame and beneath the free ends of the bar, a hinged extension on the track at the rear of the frame, means for supporting the free ends of the extension, a carriage slidably mounted on the track, a turn-table on the carriage, a cradle hinged to the turn-table, means for supporting the frame and for actuating the cutter and conveyers, comprising a bull-wheel journaled in the frame, means for elevating and depressing the frame with respect to the bull-wheel, and connections between the bull-wheel and the cutter and conveyers.

3. In a corn cutter and shocker, the combination of a frame, dividing-boards on the frame, cutting means between the dividing-boards, conveying means on the dividing-boards, means for engaging the butts of the stalks at the inner end of the dividing-boards, a trough behind the dividing-boards for receiving the cut stalks, a track on the frame, a hinged extension on the track at the rear of the frame, means for supporting the free ends of the hinged extension, a carriage slidably mounted on the track, a turn-table on the carriage, a cradle hinged to the turn-table, means for conveying the cut stalks from the trough to the cradle, means for supporting the frame and for actuating the moving parts, comprising a bull-wheel journaled in the frame.

4. In a corn cutter and shocker, the combination of a frame, dividing-boards on the frame, means for cutting the corn, means for receiving the cut stalks, a track on the frame, and provided with a hinged extension, means for supporting the hinged extension, a carriage slidably mounted on the track, a turn-table on the carriage, a cradle hinged to the turn-table, means for conveying the corn from the receiving means to the cradle, and means for supporting the frame and actuating the cutter and conveyer.

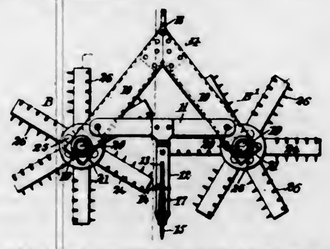
5. In a corn cutter and shocker the combination of the frame, a trackway on the frame, and provided with a hinged extension, means for supporting the extension, a carriage mounted on the trackway, a turn-table on the carriage, a cradle hinged to the turn-table, means on the frame for cutting the corn, means for receiving the corn from the cutting means, and means for conveying the corn to the cradle.

6. In a corn cutter and shocker, the combination of the frame, a trackway on the frame, and provided with a hinged extension, means for supporting the extension, means for leveling the frame with respect to the extension, a carriage mounted on the trackway, a turn-table on the carriage, a cradle hinged to the turn-table, means on the frame for cutting the corn, means for receiving the corn from the cutting means, and means for conveying the corn to the cradle.

7. In a corn cutter and shocker, the combination of the frame, a trackway on the frame, an extension hinged to the ends of the trackway, caster-wheels on the ends of the extension, means for leveling the frame with respect to the extension, a carriage mounted on the trackway, and a tilting cradle on the carriage.

8. In a corn cutter and shocker, the combination of a frame, a trackway on the frame, an extension hinged to the ends of the trackway, caster-wheels on the ends of the extension, means for leveling the frame with respect to the extension, and a tilting cradle slidably mounted on the trackway.

813,852. **HARROW.** WILLIAM H. BOND, Newcastle, Ind. Filed Oct. 12, 1905. Serial No. 282,488.

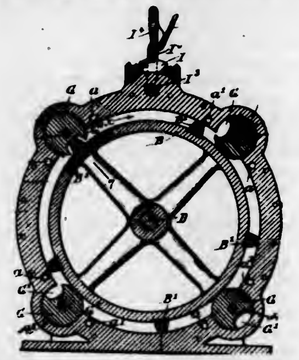


Claim.—In an agricultural implement, the combination with an A-frame and spindles mounted to revolve in the rear end portions of the limbs of the said frame, of harrows each comprising a body attached to one of the spindles, arms radially attached to the said body and teeth diagonally passed through the said arms, the inclination of the teeth of one harrow being opposite to the inclination of the teeth of the opposing harrow, an arm extending rearwardly from the frame between the two harrows, and a colter the shank of which is pivotally mounted in the said arm.

813,853. **ANIMAL-CALL.** JOSEF BRUNNER, Pinegrove, Mont. Filed Sept. 19, 1904. Serial No. 224,969.

Claim.—In a device of the character described, a trough-shaped bill pointed at its forward end, the rearward end of said bill being formed tubular and exteriorly threaded, a vibrating tongue secured at its rearward end over the open side of the bill, the forward or free end of the tongue tending to spring upward, a casing composed of two parts, the outer end of each part of the casing being provided with an opening smaller than the tubular portion of the bill, the other end of each part of the casing being interiorly threaded, and each part adapted to be threaded upon the threaded portion of the bill from opposite ends of the tubular portion of the bill, a pin threaded through the casing above the vibrating tongue, said pin adapted to control the vibrations of the tongue by screwing the same inward or outward, and a spring tending to force the pin away from the tongue, as and for the purpose specified.

813,854. **ROTARY ENGINE.** HENRY BURLIGH, New York, N. Y. Filed July 28, 1905. Serial No. 271,023.



Claim.—1. A rotary engine comprising a cylinder, a rotor mounted concentrically within the said cylinder and having a plurality of peripheral heads, rotary abutments mounted in the said cylinder and having cut-out portions for the passage of the said rotor-heads, the number of abutments being one less than the number of the said heads, and an admission, cut-off and reversing valve mechanism for controlling the steam to the cylinder at either side of each of the said abutments, arranged on one side of said rotor and an exhaust-valve on the opposite side of the same.

2. A rotary engine comprising a cylinder, a rotor mounted concentrically within the said cylinder and having a plurality of peripheral heads, rotary abutments mounted in the said cylinder and having cut-out portions for the passage of the said rotor-heads, and a valve mechanism for controlling the motive agent to the said cylinder and consisting of a ring-shaped reversing-valve having sets of ports adapted to register with ports formed in the cylinder and leading to the working space at opposite sides of each abutment, means for turning the said ring-shaped valve, to bring either port of a set of ports in register with the corresponding cylinder-port, a manually-controlled cut-off valve connected with a steam-supply, and an admission-valve interposed between the said reversing-valve and the said cut-off valve and rotating with the said rotor, the said admission-valve having in its rim elongated openings adapted to register with the ports in the said reversing-valve and the ports in the said cut-off valve.

3. A rotary engine comprising a cylinder, a rotor mounted concentrically therein and having a plurality of peripheral heads, the said rotor forming a working chamber with the said cylinder, abutments mounted to rotate in the said cylinder and in unison with the said rotor, each abutment having a cut-out portion for the passage of the said rotor-heads, a steam-chest on one end of the said cylinder and connected with a steam-supply, a manually-controlled cut-off valve mounted to turn in the said steam-chest and concentric with the said rotor, and an admission-valve rotating with the said rotor and having elongated openings adapted to register with ports in the rim of the said cut-off valve, the said elongated openings of the admission-valve being also adapted to register with ports leading into the working chamber.

4. A rotary engine comprising a cylinder, a rotor mounted concentrically therein and having a plurality of peripheral heads, the said rotor forming a working chamber with the said cylinder, abutments mounted to rotate in the said cylinder and in unison with the said rotor, each abutment having a cut-out portion for the passage of the said rotor-heads, a steam-chest on one end of the said cylinder and connected with a steam-supply, a manualy-controlled cut-off valve mounted to turn in the said steam-chest and concentric with the said rotor, an admission-valve rotating with the said roter and having elongated openings adapted to register with ports in the rim of the said cut-off valve, and a manually-controlled reversing-valve mounted to turn in the said steam-chest and having sets of admission-

ports adapted to register with the said elongated openings and with sets of ports leading into the working chamber at opposite sides of the said abutments.

5. A rotary engine comprising a cylinder, a rotor mounted concentrically therein and having a plurality of peripheral heads, the said rotor forming a working chamber with the said cylinder, abutments mounted to rotate in the said cylinder and in unison with the said rotor, each abutment having a cut-out portion for the passage of the said rotor-heads, a steam-chest on one end of the said cylinder and connected with a steam-supply, a manually-controlled cut-off valve mounted to turn in the said steam-chest and concentric with the said rotor, an admission-valve rotating with the said rotor and having elongated openings adapted to register with ports in the rim of the said cut-off valve, a manually-controlled reversing-valve mounted to turn in the said steam-chest and having sets of admission-ports adapted to register with the said elongated openings and with sets of ports leading into the working chamber at opposite sides of the said abutments, and an exhaust-valve having sets of exhaust-ports opening into the said working chamber at opposite sides of the abutments, the said exhaust-valve turning with the said reversing-valve.

6. A rotary engine comprising a cylinder, a rotor mounted concentrically therein and having a plurality of peripheral heads, the said rotor forming a working chamber with the said cylinder, abutments mounted to rotate in the said cylinder and in unison with the said rotor, each abutment having a cut-out portion for the passage of the said rotor-heads, a steam-chest on one end of the said cylinder and connected with a steam-supply, a manually-controlled cut-off valve mounted to turn in the said steam-chest and concentric with the said rotor, an admission-valve rotating with the said rotor and having elongated openings adapted to register with ports in the rim of the said cut-off valve, a manually-controlled reversing-valve mounted to turn in the said steam-chest and having sets of admission-ports adapted to register with the said elongated openings and with sets of ports leading into the working chamber at opposite sides of the said abutments, an exhaust-valve having sets of exhaust-ports opening into the said working chamber at opposite sides of the abutments, the said exhaust-valve turning with the said reversing-valve, and an exhaust-chamber at the end of the cylinder opposite the one having the said steam-chest, the said ports in the exhaust-valve opening into the said exhaust-chamber.

7. A rotary engine comprising a cylinder, a rotor mounted concentrically therein and having a plurality of peripheral heads, the said rotor forming a working chamber with the said cylinder, abutments mounted to rotate in the said cylinder and in unison with the said rotor, each abutment having a cut-out portion for the passage of the said rotor-heads, a steam-chest on one end of the said cylinder and connected with a steam-supply, a manually-controlled cut-off valve mounted to turn in the said steam-chest and concentric with the said rotor, an admission-valve rotating with the said rotor and having elongated openings adapted to register with ports in the rim of the said cut-off valve, a manually-controlled reversing-valve mounted to turn in the said steam-chest and having sets of admission-ports adapted to register with the said elongated openings and with sets of ports leading into the working chamber at opposite sides of the said abutments, an exhaust-valve having sets of exhaust-ports opening into the said working chamber at opposite sides of the abutments, the said exhaust-valve turning with the said reversing-valve, an exhaust-chamber at the end of the cylinder opposite the one having the said steam-chest, the said ports in the exhaust-valve opening into the said exhaust-chamber, and gearing in the said exhaust-chamber and connecting the said rotor with the said abutments.

813,855. **CAR-REPLACER.** WILLIAM P. BYRD, Baltimore, Md., assignor of one-third to George A. Burton, Baltimore, Md., and one-third to Brook L. Burton, Frederick county, Md. Filed July 1, 1905. Serial No. 267,949.

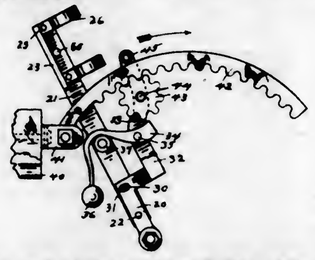
Claim.—1. A car-replacer comprising a block provided with oppositely-inclined sides provided with grooves and a rotary head between the upper ends of said inclined sides and the bottom of said block having an inclined surface along one edge with a groove extending longitudinally adjacent said inclined bottom surface.

2. A car-replacer comprising a block provided with a rotary head and inclined surfaces at opposite sides of said head and each of said inclined surfaces having arms or prongs which diverge as they recede from said head.

3. A car-replacer comprising a block provided with a flat top surface with a rotary head on said surface and also having inclined grooved surfaces at opposite sides of said flat top and one side of said block having a vertically-projecting flange which extends from the edges of the grooved surfaces toward the center of said rotating head.

4. A car-replacer comprising a block having a flat top surface which is provided with a conical recess and also having a head with a conical stem which latter is rotatable in said recess, said block also having inclined surfaces at opposite sides of said head and a shoulder extending longitudinally at one side.

813,856. **BRAKE-OPERATING MECHANISM.** JOHN CALEY, Bedford, and JEREMIAH CALEY, Bloomington, Ind. Filed Dec. 5, 1904. Serial No. 235,563.



Claim.—1. In a brake-operating mechanism, a shaft, an actuating-crank thereon, a lever for moving said crank that has some movement independently thereof, a locking-pawl mounted on said crank, and means on said lever for holding said pawl in an unlocking position when said lever is at its limit of movement in either direction relative to said crank.

2. In a brake-operating mechanism, a shaft, an actuating-crank thereon, a lever for moving said crank that has some movement independently thereof, a locking-pawl mounted on said crank with an A-shaped shank, and means on said lever upon which the A-shaped shank of the pawl rests so that the movement of said lever in either direction independently of the crank will move said pawl to an unlocking position.

3. In a brake-operating mechanism, a shaft, an actuating-crank thereon, a lever for moving said crank that has some movement independently thereof, a locking-pawl mounted on said crank with an A-shaped shank, means on said lever upon which the A-shaped shank of the pawl rests so that the movement of said lever in either direction independently of the crank will move said pawl to an unlocking position, and a weight on the shank of said pawl for moving it into a locking position.

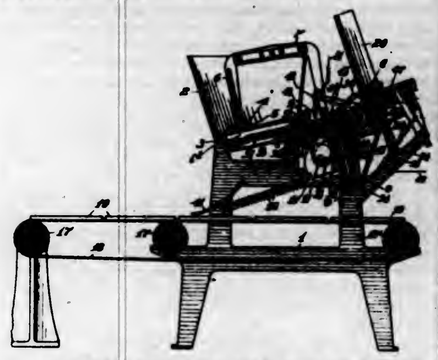
4. In a brake-operating mechanism, a shaft, an actuating-crank thereon, a ratchet-wheel carried by said crank, a rack-bar that said ratchet-wheel engages, a lever for moving said crank that has some movement independently thereof, and a pawl for engaging said ratchet-wheel and locking it with the rack-bar that is released by the independent movement of said lever.

5. In a brake-operating mechanism, a shaft, an actuating-crank thereon, a ratchet-wheel carried by said crank, a rack pivoted at one end to some stationary object, means on the crank for holding said rack in mesh with said ratchet-wheel, a lever for moving said crank which has some movement independently thereof, and a pawl mounted on said crank that engages said ratchet-wheel and locks it with the rack-bar and which is released by the independent movement of said lever.

813,857. **MACHINE FOR ICING CAKE AND OTHER PASTRY.** CLARENCE W. CARTER, Minneapolis, Minn. Filed May 14, 1904. Serial No. 207,910.

Claim.—1. In a machine of the class described, the combination with a stock-hopper and a mold or die plate, of a cut-off valve provided with an air-chamber spanning the mouth of the die-plate, when said valve is in a die-closing position, substantially as described.

2. In a machine of the class described, the combination with a stock-hopper and a mold or die plate, of a cut-off valve provided with an air-chamber spanning the mouths of the dies when said valve is in its die-closing position, substantially as described.



3. In a machine of the class described, the combination with a stock-hopper and a mold or die plate, of a cut-off valve and means for rendering air, under pressure, available to force the molded material out of the dies, substantially as described.

4. In a machine of the class described, the combination with a stock-hopper and a mold or die plate, of a cut-off valve which is recessed to afford an air-chamber spanning the dies, when the valve is in its die-closing position, and is provided with connections affording a supply of air, under pressure, to said chamber, for forcing the molded material out of the dies, substantially as described.

5. In a machine of the class described, the combination with a stock-hopper and a mold or die plate, of a pivoted chute and a pivoted guard-lever, coöperating to supply the cakes, one at a time, to the coöperating die, to hold the cake to its die-centered position until the material is molded thereon and to deliver the finished product from the die, substantially as described.

6. In a machine of the class described, the combination with a stock-hopper and a mold or die plate, of a movable chute and a movable guard device, subject to a differential motion in respect to each other, and coöperative to supply the cakes, one at a time, to the dies, hold the cakes in their die-centered position until the material is molded thereon and to deliver the finished product from the dies, substantially as described.

7. In a machine of the class described, the combination with a stock-hopper, a mold or die plate, and a cut-off valve, of a pivoted chute and a pivoted guard-lever provided with centering-fingers adapted to extend above the floor of the chute, which chute and guard-lever coöperate to supply the cakes to the coöperating die, one at a time, to hold the cake in its die-centered position until the material is molded thereon, and to deliver the finished product to receiving-trays or other receptacles, the said chute and guard-lever being subject to a differential movement for separating the same, to effect the delivery, and to bring the same together, immediately thereafter, to catch and hold the next cake and bring the same to its die-centered position, substantially as described.

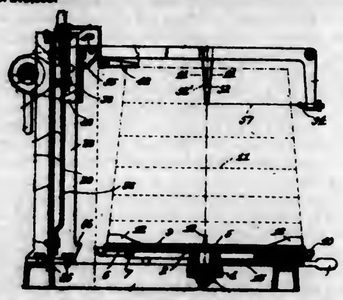
8. In a machine of the class described, the combination with a stock-hopper, a mold or die plate and a cut-off valve, of a feed-magazine having a forced-feed device for supplying the cakes, one at a time, a pivoted chute and a pivoted guard-lever, coöperating to receive the cakes from said force-feed device, to supply the same, one at a time, to the coöperating die, to hold the cake in its die-centered position, until the material is molded thereon, and to deliver the finished product to receiving-trays or other receptacles, substantially as described.

9. In a machine of the class described, the combination with a stock-hopper having as its bottom a mold or die plate, provided with a series of die-openings, a cut-off valve movable over said plate, forced-feed supply devices, a series of independently-pivoted chutes, subject to independent cams and opposing springs, and a corresponding series of guard-levers, fixed to a common rock-shaft, and subject to a cam and spring, which chutes and guard-levers coöperate to receive the cakes from said forced-feed devices, center the same under the dies, hold the same in their centered position until the material is molded thereon, and to deliver the finished product into receiving-trays or other receptacles, substantially as described.

10. In a machine for molding comfectic material, such as icing, on cakes or other pastries, the combination with devices for supplying the cakes to the dies, one at a time, in a continuous chain, of an alarm device operative to indicate a skip or break in the supply-chain of cakes, whereby the machine can be stopped before the plastic material can waste through the unbacked or open sides of the mold-plate, substantially as described.

11. In a machine of the class described, the combination with a stock-hopper, mold or die plate, and devices for supplying the cakes to the dies, one at a time, in continuous chains, of an electric alarm device, including a circuit-controller, with yielding contacts normally intercepted by cakes in the supply-chains to hold the circuit open, if the supply is normal, but adapted to close the circuit if any of the intercepting cakes, always present in the normal feed, should be absent, substantially as and for the purpose set forth.

813,858. **MACHINE FOR CUTTING BUTTER, &c.** EDWIN K. CARMEN, New York, N. Y., assignor to The Knitcraft Butter Cutter Company, a Corporation of New Jersey. Filed Aug. 5, 1905. Serial No. 272,888.



Claim.—1. A machine for cutting butter or the like material comprising a base, a cutter adjustable with respect to the base, and means for determining the adjusted positions or distances between the base and cutter, whereby cakes of butter or like material substantially frusto-conical in shape and of variable height and weight resting on said base are capable of being divided or cut into a plurality of sections, the several sections of the same cake being substantially of the same weight and volume.

2. A machine for cutting butter or like material comprising a base, a cutter adjustable with respect to the base, and means for determining the adjusted positions or distances between the base and cutter, whereby cakes of butter or like material of uniformly-varying cross-section and of variable height and weight resting on said base are capable of being divided or cut into a plurality of sections, the several sections of the same cake being substantially of the same weight and volume.

3. A machine for cutting butter or like material comprising a rotary base, a cutter adjustable with respect to the base and means for determining the adjusted positions or distances between the base and cutter, whereby cakes of butter or like material of uniformly-varying cross-section and of variable height and weight resting on said base are capable of being divided or cut into a plurality of sections, the several sections of the same cake being substantially of the same weight or volume.

4. A machine for cutting butter or like material comprising a base, a cutter adjustable with respect to the base, means for determining the adjusted positions or distances between the base and cutter, whereby a cake of butter or the like material of uniformly-varying cross-section and resting on said base is capable of being divided or cut into a plurality of sections of the same weight or volume, and means for subdividing each of the above sections of equal weight or volume into a plurality of radial segments or sections of predetermined weight or volume.

5. A machine for cutting butter or like material comprising a rotary platform, a cutter adjustable to and from the platform, and means for regulating the adjusted distances between the cutter and platform, whereby a cake of butter or like material of substantially frusto-conical shape and resting on said platform is divided up into a plurality of superposed sections of substantially the same weight or volume.

6. A machine for cutting butter or like material comprising a movable platform, a cutter adjustable to and from the platform, means for regulating the distances between the platform and cutter whereby a cake of butter or like material of substantially frusto-con-

tical shape resting on said platform is divided up into a plurality of equal contents, and means for moving said platform.

7. A machine for cutting butter or the like material comprising a rotary platform, a cutter vertically and variably adjustable with respect to the platform, means for regulating the adjustments between the platform and cutter whereby a cake of butter of uniformly-variable cross-section and resting on said platform is capable of being divided up into a plurality of superposed layers or sections of substantially the same weight or volume and means for regulating the rotation of said platform to determinately cut into segments each of the superposed layers.

8. A machine for cutting butter or the like material comprising a rotary platform, a cutter-supporting means vertically and variably adjustable with respect to the platform, means for locking said cutter-supporting means in its adjusted position, a cutter hinged to said cutter-supporting means and moving independently in a plane at right angles to the platform, and means for regulating the adjustments between the cutter-supporting means and the platform whereby a cake of butter is capable of being divided up into a plurality of sections of equal weight or volume and adjustable means for regulating the rotation of said platform to determinately cut into segments each of the sections.

9. A machine for cutting butter or the like material comprising a rotary platform, a cutter adjustable to and from the platform, and means for determining the variable distances between the cutter and platform whereby a block of butter or like material, substantially a frustum of cone in shape, and resting on said platform, is capable of being divided horizontally into a plurality of sections of the same weight or volume.

10. A machine for cutting butter or the like material comprising a rotary platform, a cutter variably adjustable to and from the platform, means for determining the variable distances between the cutter and platform whereby a block of butter or the like material resting on said platform and of substantially frusto-conical shape is capable of being divided horizontally into a plurality of sections of different height each being substantially the same weight or cubical contents, and means for rotating said platform through a predetermined and variable angle.

11. A machine for cutting butter or the like, comprising a platform, a cutter variably adjustable to and from the platform, and means for regulating the variable distances between the cutter and platform whereby a cake of butter or the like of variable height resting on said platform and of substantially frusto-conical shape is capable of being divided up into a plurality of sections of frusto-conical shape and different heights, and each section having the same weight or cubical contents.

12. A machine for cutting butter or the like comprising a rotary platform, a cutter having mountings adjustable to variable distances to and from the platform and having an independent movement in a plane at right angles to the plane of the platform, adjustable means for determining the variable distances between the cutter and platform whereby cakes of butter or the like of different heights resting on said platform and of substantially frusto-conical shape are capable of being divided up into a plurality of sections of frusto-conical shape and of different heights and each of the several sections of the same cake having substantially the same weight and volume, and means for rotating said platform through predetermined and variable angles to divide each of the sections into radial segments of predetermined weight or volume.

13. A machine for cutting butter or the like material comprising a base, a platform rotatably supported on said base, means for regulating the arc of rotation of said platform, a standard rigidly connected to the base, an adjustable dividing-plate pivotally supported to the standard and having a plurality of properly-spaced height-indicating edges between its pivot-point and upper end, means for locking the dividing-plate to the standard, an adjustable height-gage engaging the dividing-plate and controlling the adjusted or locked position of the said plate, an adjustable carriage constructed to move up and down on the standard and adapted to rest on the height edges of the dividing-plate in its different adjusted positions, and a cutter pivotally connected to said adjustable carriage and moving in a plane at right angles to the plane of the platform.

14. A machine for cutting butter or the like material comprising a base, a turn-table rotatably supported on said base and provided with a depending rim, a clutch mechanism for intermittently engaging the rim, an adjustable means for controlling the movement of the clutch mechanism and rotation of the turn-table, a standard rigidly connected to the base, an adjustable dividing-plate pivotally supported to the standard and having a plurality of properly determined and spaced height-indicating edges between its pivot-point and upper end, means for locking the dividing-plate to the standard, an adjustable height-gage engaging the dividing-plate and controlling the adjusted or locking position of the said plate, an adjustable carriage constructed to move up and down on the platform and adapted to rest on the height edges of the dividing-plate in its adjusted positions, and a cutter pivotally connected to the adjustable carriage and moving in a plane at right angles to the plane of the turn-table.

15. A machine for cutting butter or the like material comprising a base, a turn-table rotatably supported on said base, a pan resting on said turn-table and having a peripheral flange adapted to engage the same, means for rotating said turn-table, and means for operatively supporting a cutter above said turn-table.

16. A machine for cutting butter or like material comprising a base, a cutter adjustable with respect to the base, and means for determining the adjusted positions or distances between the base and cutter, whereby cakes of butter or like material of variable height and uniformly-varying cross-section resting on said base are capable of being divided or cut into a plurality of sections, the several sections of the same cake being substantially of the same weight and volume.

17. A machine for cutting butter or like material comprising a rotary base, a cutter adjustable with respect to the base and means for determining the adjusted positions or distances between the base and cutter, whereby cakes of butter or like material of variable height and uniformly-varying cross-section resting on said base are capable of being divided or cut into a plurality of sections, the several sections of the same cake being substantially of the same weight or volume.

18. A machine for cutting butter or like material comprising a base, a cutter adjustable with respect to the base, means for determining the adjusted positions or distances between the base and cutter, whereby a cake of butter or the like material resting on said base is capable of being divided or cut into a plurality of sections of the same weight or volume, and means for subdividing each of the above sections of equal weight or volume into a plurality of radial segments or sections of predetermined weight or volume.

19. A machine for cutting butter or the like material comprising a base, a turn-table rotatably supported on said base, a pan resting on said turn-table and having a peripheral flange adapted to engage the same, the outer edges of the flange being turned up to form a circular trough around the edge of the pan, and means for operatively supporting a cutter above said turn-table.

20. A butter-cutter comprising a rotary platform for holding a cake of butter, a vertical standard at the side of said platform, a vertically-extending dividing-plate pivoted near the bottom of said standard on a horizontal pivot, said dividing-plate being provided with a series of height-measuring edges having a predetermined relation to the platform, a height-gage vertically adjustable on the upper end of the standard, coöperating means between the pivoted dividing-plate and the height-gage whereby upon movement of the dividing-plate the height-gage is moved up or down, a vertically-movable carriage on the standard, a cutter secured to the carriage, and means for fixing the position of the carriage and cutter by coöperation with the height-measuring edges.

21. A butter-cutter comprising a rotary platform for holding a cake of butter, a vertical standard at the side of said platform, a vertically-extending dividing-plate pivoted near the bottom of said standard on a horizontal pivot, said dividing-plate being provided with a series of height-measuring edges having a predetermined relation to the platform, a height-gage having a vertically-sliding connection with the standard, an inclined slot in the dividing-plate, a pin projecting from the height-gage and into said slot whereby the pivotal movement of the dividing-plate moves the height-gage up or down, a vertically-movable carriage on the standard, a cutter secured to the carriage, and means for fixing the position of the carriage and cutter by coöperation with the height-measuring edges.

22. A butter-cutter comprising a rotary platform for holding a cake of butter, a vertical standard at the side of said platform, a vertically-extending dividing-plate pivoted near the bottom of said standard on a horizontal pivot, said dividing-plate being provided with a series of cut-away portions providing inclined height-measuring edges, a height-gage vertically adjustable on the upper end of the standard and having an arm adapted to engage the top of the cake of butter, the coöperating means between the pivoted dividing-plate and the height-gage whereby upon movement of the dividing-plate the height-gage is moved up or down, means for securing the dividing-plate in position when the arm of the height-gage has engaged the top of the cake of butter, a vertically-moving carriage, a projection on said carriage adapted to engage any one of the height-measuring edges, a cutter secured to the carriage, and means for securing the carriage to the standard in any adjusted position whereby the cutter is set in a predetermined relation to the platform.

24. A butter-cutter comprising a rotary platform for holding a cake of butter, a vertical standard at the side of said platform, a vertically-extending dividing-plate pivoted near the bottom of said standard on a horizontal pivot, said dividing-plate being provided with a series of height-measuring edges having a predetermined relation to the platform, a height-gage vertically adjustable on the upper end of the standard, coöperating means between the pivoted dividing-plate and the height-gage whereby upon movement of the dividing-plate the height-gage is moved up or down, a vertically-movable carriage on the standard, a cutter secured to the carriage, and means for fixing the position of the carriage and cutter by coöperation with the height-measuring edges, means for rotating the platform, and adjustable means for determining the arc of rotation of the platform whereby to sever from the cake of butter a predetermined volume or weight thereof.

25. A butter-cutter comprising a rotary platform for holding a cake of butter, a vertical standard at the side of said platform, a vertically-extending dividing-plate pivoted near the bottom of said standard on a horizontal pivot, said dividing-plate being provided with a series of height-measuring edges having a predetermined relation to the platform, a height-gage vertically adjustable on the upper end of the standard, coöperating means between the pivoted dividing-plate and the height-gage whereby upon movement of the dividing-plate the height-gage is moved up or down, a vertically-movable carriage on the standard, a cutter secured to the carriage, means for fixing the position of the carriage and cutter by coöperation with the height-measuring edges, a lever for rotating the platform, a stop for limiting the rotation of the platform in one direction, and an adjustable stop for limiting its movement in the opposite direction whereby to sever from the cake of butter a predetermined volume or weight thereof.

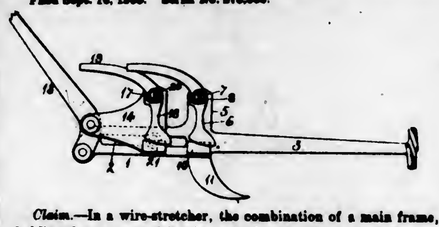
26. A butter-cutter comprising a rotary platform for holding a cake of butter, a vertical standard at the side of said platform, a vertically-extending dividing-plate pivoted near the bottom of said standard on a horizontal pivot, said dividing-plate being provided with a series of height-measuring edges having a predetermined relation to the platform, a height-gage vertically adjustable on the upper end of the standard, coöperating means between the pivoted dividing-plate and the height-gage whereby upon movement of the dividing-plate the height-gage is moved up or down, a vertically-movable carriage on the standard, a cutter secured to the carriage, means for fixing the position of the carriage and cutter by coöperation with the height-measuring edges, a lever for rotating the platform having means for engaging the platform whereby the lever when moved in one direction will move the platform but when moved in the opposite direction will move freely without disturbing the position of the platform, a fixed stop limiting the movement of the lever in one direction, a rotating graduating disk provided with a cam-stop for determining the starting-point of the lever and therefore the arc through which the platform may rotate whereby to sever from the cake of butter a predetermined volume or weight thereof.

27. In a machine for cutting butter or the like material, a base, a table supported on said base, a pan resting on said table and having a peripheral flange adapted to engage the outer edge of the table, the outer edge of the flange being turned up to form a circular trough around the edge of the pan.

28. In a machine for cutting butter or the like material, a base, a rotary table consisting of a plurality of separated radial arms and supported on said base, a pan resting on said table and having a peripheral flange adapted to engage the outer ends of the radial arms, the outer edge of the flange being turned up to form a circular trough around the edge of the pan.

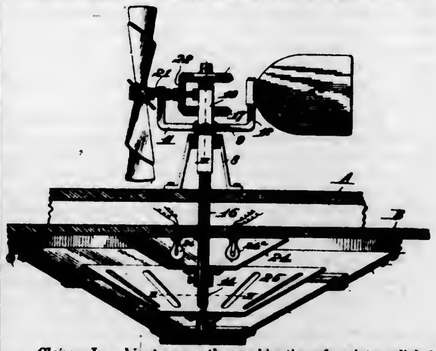
29. In a machine for cutting butter or the like material, a base, a rotary table consisting of a plurality of separated radial arms and supported on said base, a pan resting on said table and having a peripheral flange adapted to engage the outer ends of the radial arms, the outer edge of the flange being turned up to form a circular trough around the edge of the pan, and ribs or ridges on the upper side of the pan.

813,859. **WIRE-STRETCHER.** FLOYD H. CARTER, Beloit, Wis. Filed Sept. 16, 1905. Serial No. 278,266.



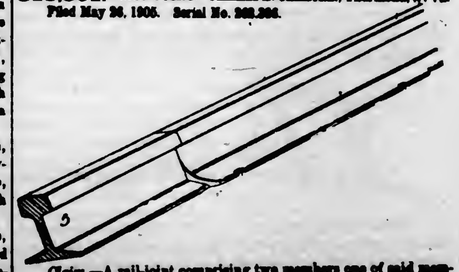
Claim.—In a wire-stretcher, the combination of a main frame, a holding-dog supported by the main frame, a lever pivotally connected to the main frame, the main frame provided with a lengthwise slot, a plate pivoted at one end with the lever and its other end slidably located in the slot, and a dog supported by the plate.

813,860. **KINETOSCOPE FOR ADVERTISING.** WILLIAM D. CARTER, Quincy, Ill. Filed Oct. 27, 1905. Serial No. 283,797.



Claim.—In a kinetoscope, the combination of a picture-disk in the form of the frustum of a cone, a perforated disk arranged concentric and parallel to said picture-disk, means for rotating said disks in opposite directions, and a view-casing inclosing said disks and arranged concentric and parallel thereto, said casing comprising an upper sloping portion adapted to carry advertising matter, a lower sloping sight portion, and a straight bottom portion adapted to carry advertising matter, substantially as set forth.

813,861. **RAIL-JOINT.** CHARLES B. CHRISTIAN, Thurmond, W. Va. Filed May 26, 1905. Serial No. 262,266.



Claim.—A rail-joint comprising two members one of said members having an integral basal splice-tongue coextensive in width with the base thereof and formed with a transversely-convexed upper face, and the other member a basal recess to receive said tongue, said

recess being substantially coextensive in length and width with said tongue and formed with a curved wall to rest upon the curved face of the tongue, the latter-named member also being provided with thickened attaching-flanges overlying the sides of the tongue and formed with spike-notches.

813,862. AIR-ADMISSION DEVICE FOR LOCOMOTIVE FIRE-BOXES. CHARLES B. CLARK, New York, N. Y. Filed May 22, 1905. Serial No. 261,794.

Claim.—1. An air-admission device for locomotive fire-boxes comprising a closure for the fuel-opening therein, itself provided with an opening, an outwardly-swinging hood mounted on the face of the closure, and means for supporting the same in the different positions to which the lower edge thereof may be carried, embodying members having corresponding openings therein, and a device for insertion in opposite ones of said openings.

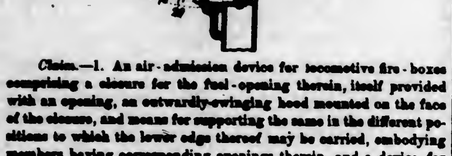
2. An air-admission device for locomotive fire-boxes comprising a closure for the fuel-opening therein, itself provided with an opening, an outwardly-swinging hood mounted on the face of the closure, means for supporting the same in the different positions to which the lower edge thereof may be carried, embodying forwardly-projecting members from the face of the closure having spaced openings therein, and a supporting-rod for the closure for insertion in corresponding ones of the openings.

3. An air-admission device for locomotive fire-boxes comprising a closure for the fuel-opening therein, itself provided with an opening, an outwardly-swinging hood mounted on the face of the closure, and means for supporting the same in the different positions to which the lower edge thereof may be carried, said hood being of outwardly-curved form and having end sections, and said means embodying forwardly-projecting members from the face of the closure constituting guides for the hood.

4. An air-admission device for locomotive fire-boxes comprising a closure for the fuel-opening therein, itself provided with an opening, an outwardly-swinging hood mounted on the face of the closure, and means for supporting the same in the different positions to which the lower edge thereof may be carried, the opening in the said closure being formed by bending portions of the closure inwardly, and said portions between them constituting a flue for imparting direction to the air passing into the fire-box.

5. An air-admission device for locomotive fire-boxes comprising a closure for the fuel-opening therein, itself provided with an opening, an outwardly-swinging hood mounted on the face of the closure, and means for supporting the same in the different positions to which the lower edge thereof may be carried, embodying forwardly-extending members having flanges lying against the face of the closure at opposite edges of the opening therein, and rivets securing said flanges to said closure.

813,868. HORSE-COLLAR FASTENER. JOHN C. CLARKE, Wausa, Nebr. Filed Aug. 3, 1905. Serial No. 272,869.



Claim.—1. A horse-collar fastener consisting of two base-plates, upwardly-projecting flanges at the adjacent edges of said plates, and a latch-bar pivoted longitudinally at one end to the body portion of one of said plates rearwardly of its flange, said latch-bar having a flange extending downwardly from its free end to swing over the upwardly-projecting flange of the opposite plate.

2. A horse-collar fastener consisting of two base-plates, one plate having a groove in its front edge, the other plate provided with a corresponding rib on its front edge to fit into said groove, a latch-bar pivotally secured longitudinally at its one end to the body portion of one of the plates rearwardly of its front edge and having a downwardly-projecting flange at its free end, and a vertical projection on the opposite plate over which the flanged end of said latch-bar is to be swung longitudinally and lock the adjacent edges of the two plates together.

3. A horse-collar fastener consisting of two plates, each plate having a flange or projection at its front edge, the flange of one plate having in its vertical face grooves on each side of a central filler or block, and the flange of the opposite plate having ribs to fit in said grooves and a cut-out or space to receive the aforesaid central filler, and a latch pivotally secured to one plate to swing over and engage the flange of the opposite plate.

4. A horse-collar fastener consisting of two base-plates, each plate having an upwardly-projecting flange at its front end, one of said flanges having a plurality of grooves in its front face and the flange on the opposite plate provided with ribs projecting from the front face of its flange fitting within the aforesaid grooves of the opposite flange, a latch-bar pivotally secured longitudinally at its one end to the body portion of one of said plates rearwardly of its flange and provided at its free end with a downwardly-projecting flange at its free end to be swung longitudinally over the upwardly-projecting flange of the opposite plate to lock the two plates together, and means for preventing the lateral displacement of the flanges when locked together.

5. A horse-collar fastener consisting of two plates, each plate provided with means for adjustably securing it to the ends of a collar and having a flange at its front edge, the flange of one plate having in its vertical face grooves on each side of a central filler or block, the flange of the opposite plate having ribs to fit in said grooves and a cut-out or space to receive the aforesaid central filler, one of the plates provided with vertically-projecting perforated ears, a latch having pintles pivotally secured in said ears, said latch swinging over and engaging the flange of the opposite plate.

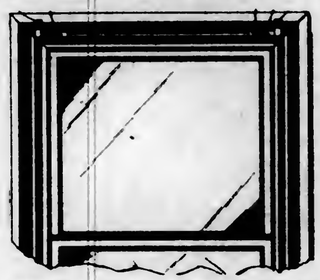
813,864. DRILL-CHUCK. HARRY L. COFF, New London, Conn. Filed Sept. 3, 1904. Serial No. 223,180.

Claim.—1. A drill-chuck comprising a core, an enlarged portion at one end of said core, oblique openings through said enlarged portion, a sleeve surrounding said core, a collar surrounding said core within said sleeve and adapted to move lengthwise thereof, said collar having cylindrical openings extending transversely therethrough and openings extending through the face of said collar into said cylindrical openings of less diameter than said cylindrical openings, jaws circular in cross-section extending through said openings in the enlarged portion of said core and substantially disk-shaped heads on the inner ends of said jaws, said heads being adapted to enter the openings in the face of said collar when turned to a position parallel therewith, substantially as described.

2. A drill-chuck comprising a core, an enlarged portion at one end of said core, oblique openings through said enlarged portion, a sleeve surrounding said core, a collar surrounding said core within said sleeve and adapted to move lengthwise thereof, said collar having cylindrical openings extending transversely therethrough and openings extending through the face of said collar into said cylindrical openings of less diameter than said cylindrical openings, jaws circular in cross-section extending through said openings in the enlarged portion of said core and substantially disk-shaped heads on the inner ends, of said jaws, said heads being adapted to enter the openings in the face of said collar when turned to a position parallel therewith and means for preventing said jaws from being turned, substantially as described.

813,865. CURTAIN-FIXTURE. JOHN CRAMER, Lima, Ohio, assignor of one-half to Theodore Feist, Lima, Ohio. Filed Apr. 27, 1905. Serial No. 257,780.

Claim.—1. A combination-fixture comprising a slotted body-plate bent at one end to form an arm having an aperture therein and rebent to form a keeper portion and a pole-supporting bracket comprising a strip bent to form a tongue for connection with said supporting portion, and a shoulder to rest thereon.



2. A combination-fixture comprising a slotted body-plate bent at one end to form an arm having an aperture therein and rebent to form a keeper portion, said keeper portion being folded upon itself to form a socket, and a pole-supporting bracket having a tongue to enter said socket and a shoulder to rest thereon.

813,866. TRACE-TIGHTENER. GEORGE S. DAVEY, Frankfort, Mich. Filed Aug. 26, 1904. Serial No. 223,167.

Claim.—1. A device of the kind described, consisting of a substantially U-shaped guide provided with means for securing the same in position, in combination with a slidable clevis, lateral extensions on the base of said clevis adapted to engage and loosely embrace lateral extensions on the upper parts of said guide, a pin 2, movement of said clevis and pin being parallel to said guide, resilient means tending to draw and normally maintain the clevis near the rear end of said guide, and a stop and arm arranged in the path of the clevis and pin adapted to simultaneously engage the base of the clevis and upper part of the pin respectively.

2. A device of the kind described, consisting of a substantially U-shaped guide provided with means for securing the same in position, in combination with a slidable clevis, lateral extensions on the base of said clevis adapted to engage and loosely embrace lateral extensions on the upper parts of said guide, a pin 2, movement of said clevis and pin being parallel to said guide, resilient means tending to draw and normally maintain the clevis near the rear end of said guide, a stop and arm arranged in the path of the clevis and pin adapted to simultaneously engage the base of the clevis and the upper part of the pin respectively, and an extension of the arm adapted to engage the pin and maintain the clevis against strain or displacement while sliding on the guide

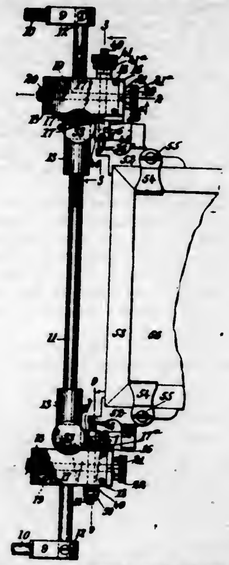
---

813,867. MICROMETRICAL ADJUSTMENT FOR PRINTING-FILM FRAMES. BENJAMIN DAY, West Hoboken, N. J. Filed Apr. 28, 1905. Serial No. 257,462.

Claim.—1. The combination of a locally-threaded stub-shaft journaled in a casing at both ends with a revoluble milled protractor operating or turning said stub-shaft at one end and a fixed collar at the other end to hold said stub-shaft loosely in position, an internally-threaded carriage through which the threaded portion of said stub-shaft passes, fitting its threads easily, and a powerful spiral spring encircling one end of the stub-shaft and tensioning the threads of the carriage against the threads of the stub-shaft and likewise of the collar where it bears on the outside of the casing, thus bringing pressure to bear on the threads of the carriage so as to take up the backlash of the threads when the stub-shaft is rotated and at the bearings of the collar where it impinges on the outside of the casing.

2. The combination of a milled-head protractor provided with an annular passage, a boss entering this annular passage and rigidly mounted upon the stud against which the milled-head protractor revolves, and a screw passing directly through the milled-head protractor and into this annular passage, which, when the milled-head protractor is turned in either direction the movement of the threaded pintle, is stopped by the screw striking the boss.

3. The combination of a casing, a carriage movably mounted therein and provided with a thread, a revoluble stub-shaft mounted partially within said casing and provided with a thread engaging said thread of said carriage, means for turning said revoluble stub-shaft, a spring mounted within said casing and engaging said carriage for the purpose of tensioning the same relatively to said stub-shaft, and means connected with said carriage for supporting a frame.



4. The combination of a supporting-rod, a sleeve mounted thereupon, a dolly connected with said sleeve, a spring for tensioning said dolly, and a screw for forcing said dolly into engagement with said supporting-rod.

5. The combination of a casing, a carriage mounted therein, a pintle engaging said carriage and adjustable relatively thereto, a spring for tensioning said pintle relatively to said carriage, a lug mounted upon said carriage, a protractor for measuring movements of said pintle relatively to said carriage, said protractor being provided with a revoluble head, and a member mounted upon said revoluble head and adapted to engage said lug.

6. The combination of a pintle serving as a journal for supporting an angularly-movable frame, a carriage provided with a lug for supporting said pintle, a spring for tensioning said pintle relatively to said carriage, a protractor provided with a revoluble member for adjusting the position of said pintle relatively to said carriage, and means for limiting the range of said protractor so as to maintain the tension of said spring approximately constant.

7. The combination of a casing, a stub-shaft mounted therein and adapted to be rotated, said stub-shaft being provided with a thread, a collar mounted upon said stub-shaft and engaging said casing so as to prevent longitudinal movements of said stub-shaft in one direction, a carriage mounted within said casing and provided with a thread engaging said thread of said stub-shaft, said casing being thus rendered movable by rotation of said stub-shaft, a spring encircling said stub-shaft and engaging said casing and said carriage, and a bearing connected with said carriage for supporting a printing-film.

8. The combination of a pintle, one end of which is threaded, a collar mounted upon said pintle, a comparatively strong spiral spring encircling said pintle and bearing at one end of said spring against said collar, a stop for supporting the other end of said spring, a revoluble milled-head protractor threaded internally to fit the threaded end of said pintle and bearing against said stop, a longitudinal guide-boss attached to said pintle and radiating laterally therefrom, and means for preventing angular movement of said guide-boss.

9. The combination of a frame for supporting a printing-film or the like, a pintle for supporting said frame, a boss mounted upon said pintle and extending radially therefrom to prevent rotation thereof, guide mechanism engaging said boss and allowing the same to travel in the general longitudinal direction of said pintle but not to move

angularly, and a micrometrical adjusting device for moving said pintle in the general direction of its axis, thereby securing a fine adjustment.

10. The combination of a supporting-rod, a casing mounted thereupon, a sleeve slidably mounted within said casing, a screw connected with said sleeve and adapted to move toward and from said supporting-rod, a dolly mounted intermediate of said screw and said rod so as to be forced against the latter, and mechanism connected with said casing for supporting a frame.

11. The combination of a carriage provided with depending lugs having apertures therethrough, a pintle disposed loosely within said apertures and provided with a threaded end, a revoluble member mounted upon said pintle and provided with a thread engaging said thread of said pintle for causing said pintle to travel in the general longitudinal direction of its axis relatively to said carriage, and a longitudinal guide-boss mounted upon said pintle and projecting laterally therefrom, for the purpose of engaging a portion of said carriage serving as a guideway therefor.

12. The combination of a carriage provided with a guideway, a pintle supported by said carriage and provided with a journal for supporting a printing-film frame or the like, a boss mounted upon said pintle and projecting laterally therefrom into said guideway so as to prevent rotation of said pintle and yet to move freely in the general longitudinal direction of said pintle, micrometric mechanism for moving said pintle in the general direction of the length thereof, and means for supporting said carriage.

13. The combination of a casing, a stub-shaft revolubly journaled therein and having a comparatively loose bearing-contact therewith, said stub-shaft being provided with a thread, a collar mounted upon said stub-shaft and engaging said casing so as to prevent movements of said stub-shaft in the general direction of the length of the axis thereof, a carriage mounted within said casing and provided with a thread engaging said thread of said stub-shaft, a spring for tensioning said stub-shaft relatively to said casing so as to limit the main friction due to rotation of said stub-shaft to points of engagement only, and a bearing connected with said carriage for supporting a printing-film or the like.

14. The combination of a casing, a carriage movable relatively thereto and provided with a thread, a stub-shaft provided with a thread engaging said thread of said carriage, a collar mounted upon said stub-shaft and engaging said casing, a spring engaging said casing and said carriage so as to take up the play between said stub-shaft and said carriage, a bearing connected with said carriage and adapted to support a printing-film frame or the like, and a member connected with said stub-shaft whereby the latter may be rotated.

15. The combination of a supporting member provided with an aperture, a pintle mounted upon said supporting member and adapted to move relatively thereto for supporting a printing-film frame or the like; a boss mounted upon said pintle and projecting radially therefrom through said aperture in said supporting member to prevent said pintle from turning, said boss being comparatively long so that its outer end may be readily observed by the operator, and a revoluble member threaded upon said pintle and engaging said carriage for adjusting said pintle in the general direction of the axis thereof.

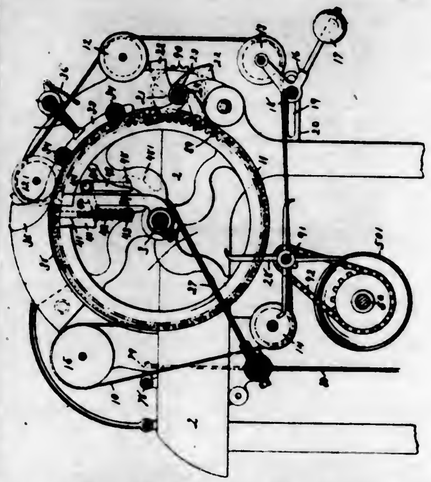
813,868. TOBACCO-STRIPPER. MARTIN DELLER, Newark, N. J. Filed July 26, 1904. Serial No. 217,221.

Claim.—1. The combination with a drum presenting a circumferential slot with cutting edges on opposite sides thereof, and means for holding tobacco-leaves thereon, of a rotary cutter having a series of radial arms adapted to turn in said slot, each arm comprising a body portion flaring both from the hub radially outward and from its rear edge toward the forward edge, and knife-blades mounted on the sides of said body portion.

2. The combination with the circumferentially-slotted drum, and means for holding tobacco-leaves thereon, of a rotary cutter having a series of radial arms adapted to enter the slot of the drum, each arm comprising a body portion wedge-shaped in cross-section, with its widest edge forward, and knife-blades mounted on the sides of said body portion.

3. In a tobacco-stripping machine, the combination with a rotary drum, circumferentially slotted to receive the mid-rib of a leaf, and means for rotating said drum, of curved pressure-strips adapted to lie against the drum on opposite sides of said slot, and means for resiliently supporting said pressure-strips.

4. In a tobacco-stripping machine, the combination with a rotary drum, circumferentially slotted to receive the mid-rib of a leaf, and means for rotating said drum, of curved pressure-strips adapted to lie against the drum on opposite sides of said slot, rollers mounted upon said strips and lying between the same and across the drum-slot, and means for resiliently supporting said pressure-strips.



5. In a tobacco-stripping machine, the combination with a rotary drum, circumferentially slotted to receive the mid-rib of a leaf, and means for rotating said drum, of a resiliently-supported arm extending toward the drum in the plane of its slot and being bifurcated adjacent to said slot, a curved pressure-strip upon each bifurcation of said arm, adapted to lie against the drum at one side of its slot and having its forward and curved outward, and rollers mounted between and upon said pressure-strips and extending across the slot of the drum.

6. In a tobacco-stripping machine, the combination with a drum and means for imparting to said drum an intermittent rotary motion, of leaf-holding fingers normally lying against the surface of the drum, supporting means permitting said fingers to move away from the drum but always retaining their parallel relation thereto, and tripping means adapted to raise said fingers just before the drum stops in its rotary movement and release them just as the drum starts again.

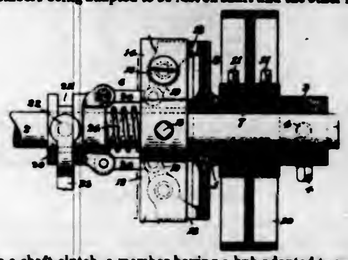
7. The combination with the drum adapted to receive tobacco-leaves, of an arm fixed on the shaft of said drum and providing a radial slideway, a stem arranged in said slideway, and projecting through the drum-surface, a clamping-finger upon said stem outside the drum and parallel to the surface thereof, a spring normally forcing said stem toward the drum-shaft, and tripping means adapted to raise said fingers away from the drum at predetermined intervals.

8. In a tobacco-stripper, a frame, a shaft, a drum on said shaft and means for turning the same, an arm on the shaft providing a radial slideway, a stem in said slideway, a clamping-finger upon said stem outside the drum, a spring normally forcing said stem toward the shaft, a bent lever fulcrumed upon the drum and adapted at one end to engage said stem, and a pin upon the frame adapted to be engaged by the other end of said lever.

9. In a tobacco-stripper, a frame, a shaft, a drum on said shaft and means for turning the same, an arm on the shaft providing at one side of its outer end a tubular slideway having a slot in its side, a stem in said slideway having a lateral pin lying in said slot, a clamping member upon said stem outside the drum-surface, a stop upon the inner extremity of the stem, a coiled spring upon said stem between the slideway and said stop and adapted to force the stem inward toward the shaft, and tripping means upon the drum adapted to engage said pin of the stem.

813,869. SHAFT-CLUTCH. MARTIN DELLER, Newark, N. J. Filed Nov. 28, 1904. Serial No. 234,737.

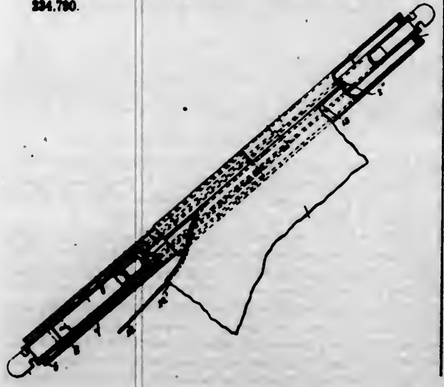
Claim.—1. In a shaft-clutch, a member having a hub adapted to receive the shaft and being provided with a radially-projecting flange having a circular series of teeth upon one of its sides, a second member having a cross-piece adapted to be mounted directly upon the shaft and lie transversely thereof providing opposite arms which project radially from the shaft, levers fulcrumed intermediate of their ends one upon each arm of the cross-piece and adapted to swing in the plane determined by said arm and the shaft, each lever being adapted at its outer end or end farthest from the shaft to engage the said teeth of the first-mentioned member of the clutch and terminating at its opposite or inner end short of the shaft, and means for engaging said inner ends of the levers to swing the same, one of said clutch members being adapted to be fast on shaft and the other loose.



2. In a shaft-clutch, a member having a hub adapted to receive the shaft and being provided with a radially-projecting flange having a circular series of teeth upon one of its sides, a second member having a cross-piece adapted to be mounted directly upon the shaft and lie transversely thereof, providing opposite arms which project radially from the shaft, levers fulcrumed intermediate of their ends one upon each arm of the cross-piece and adapted to swing in the plane determined by said arm and the shaft, each lever being adapted at its outer end or end farthest from the shaft to engage the said teeth of the first-mentioned member of the clutch and terminating at its opposite or inner end short of the shaft, a controlling-sleeve on the shaft, and links substantially parallel to the shaft connecting the said inner ends of the levers to said sleeve, one of said clutch members being adapted to be fast on the shaft and the other loose.

3. In a shaft-clutch, a member having a hub adapted to receive the shaft and being provided with a radially-projecting flange having a circular series of teeth upon one of its sides, a second member having a cross-piece adapted to be mounted directly upon the shaft and lie transversely thereof, providing opposite arms which project radially from the shaft, levers fulcrumed intermediate of their ends one upon each arm of the cross-piece and adapted to swing in the plane determined by said arm and the shaft, each lever being adapted at its outer end or end farthest from the shaft to engage the said teeth of the first-mentioned member of the clutch and terminating at its opposite or inner end short of the shaft, a controlling-sleeve on the shaft, a coiled spring adapted to surround the shaft between said cross-piece and controlling-sleeve, and links outside said spring and substantially parallel to the shaft connecting the inner ends of the levers to the sleeve, one of said clutch members being adapted to be fast on the shaft and the other loose.

813,870. EXTENSIBLE SPRING-ROLLER. LOUIS J. DEMARE, Torrington, Conn., assignor, by direct and mesne assignments, to The Torrington Novelty Manufacturing and Supply Company, Torrington, Conn., a Corporation of Connecticut. Filed Nov. 28, 1904. Serial No. 234,790.



Claim.—1. A telescoping spring-roller comprising in combination, an exterior telescoping member, an inner telescoping member provided with a longitudinal slot, a sleeve slidably mounted on the inner member and secured to the exterior member, and a spring one of whose ends is secured to said sleeve and whose other end enters said slot.

2. In a telescoping spring-roller, the combination of a pair of telescoping tubes constituting an exterior member, a pair of telescoping tubes constituting an inner member, studs extending from the inner member and upon which the exterior member is mounted, and a spring interposed between said members.

3. In a telescoping spring-roller, the combination of a pair of telescoping tubes constituting an exterior member, plates at the ends of said member, a pair of telescoping tubes constituting an inner member, slotted studs extending from the inner member and upon which said plates are mounted, and a spring interposed between said members.

4. In a telescoping spring-roller, the combination of a pair of telescoping tubes constituting an exterior member whose parts are relatively immovable radially, a similar telescoping inner member which is provided with a longitudinal slot, studs extending from the inner member and upon which the exterior member is rotatably mounted, a sleeve slidably mounted upon the inner member and which is secured to the exterior member, and a spring one of whose ends is secured to said sleeve and whose opposite end enters said slot.

813,871. WARDROBE. PATRICK DOWD, New York, N. Y. Filed June 20, 1905. Serial No. 265,881.

Claim.—1. A wardrobe provided with a series of counterbalanced partitions, slidable in its casing.

2. A wardrobe provided with a series of opposing slideways, and partitions of less height than the height of the wardrobe, which partitions are mounted in said slideways, guide-pulleys carried by the casing, cables attached to the said partitions and passed over the said pulleys, and weights attached to the ends of the said cables.

3. In a wardrobe, a casing, counterbalance-partitions having vertical sliding movement in said casing, said partitions being provided with series of vertical ribs dividing them into compartments, and a hook in each of the said compartments.

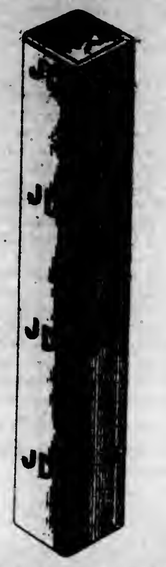
4. In a wardrobe, a casing provided with side pockets open at the top and slideways upon its inner face, partitions of less height than the height of the casing mounted to slide in the said slideways, each partition being divided into a series of compartments by vertical parallel ribs, a hook in each of the said compartments, pulleys secured within the casing at the upper open portion of the pockets, cables attached to the upper end portions of the partitions, which cables are passed over the said pulleys into the said pockets, and weights attached to the lower ends of the said cables.

813,872. LAND-MARKING MONUMENT. JOHN H. DOWNS, New York, N. Y. Filed Jan. 23, 1905. Serial No. 242,262.

2. As a new article of manufacture, a pressed wear-plate of the character described having a projection at its upper side, and a seat

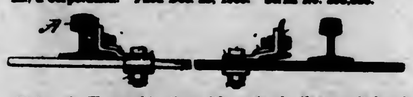
means for effecting the vertical adjustment of said brushing device, said outer and intermediate roll, a buffer secured to said lower jaw

813,872. LAND-MARKING MONUMENT. JOHN H. DOWNS, New York, N. Y. Filed Jan. 23, 1905. Serial No. 242,242.



Claim.—The herein-described monument for marking property-lines consisting of a hollow outer shell 1, of rectangular cross-section and of equal diameter from end to end and having rounded corners, said shell being formed of vitrified clay, a cement filling 3 molded within the shell 1, longitudinally-disposed metallic stiffening-rods 4 embedded within the cement filling, said rods having their ends bent inwardly at right angles to anchor the rods in place, identification-marks arranged on the sides of said outer shell, and a center mark arranged in the cement filling in the upper end of the same, essentially as described.

813,873. ADJUSTABLE SWITCH-ROD. WILLIAM H. ELLIOT, St. Louis, Mo., assignor to Elliot Frog & Switch Company, East St. Louis, Ill., a Corporation. Filed Dec. 29, 1905. Serial No. 293,693.



Claim.—1. The combination with a pair of railway switch-point rail-sections, of a bracket connected to one of said switch-point rail-sections, a switch-rod having a polygonal aperture therein, an eccentric-block seated in said polygonal aperture, and a bolt passing through said bracket and eccentric-block, substantially as set forth.

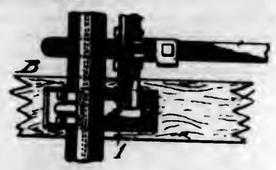
2. The combination with a pair of railway switch-point rail-sections, of a bracket connected to one of said rail-sections, a switch-rod having a star-shaped aperture therein, an eccentric-block of star shape fitting in said aperture, and a bolt passing through said bracket and said eccentric-block, substantially as set forth.

3. The combination of a pair of railway switch-point rail-sections, a bracket secured to one of said rail-sections and having a U-shaped arm, a switch-rod fitting within the U-shaped arm of said bracket and having a polygonal aperture therein, a polygonal eccentric-block seated in said polygonal aperture, and a bolt passing through said U-shaped arm and said eccentric-block, substantially as set forth.

813,874. WEAR-PLATE FOR RAILWAY-SWITCHES. WILLIAM H. ELLIOT, St. Louis, Mo., and JOHN J. TOUSSAINT, East St. Louis, Ill., assignors to Elliot Frog & Switch Company, East St. Louis, Ill., a Corporation. Filed Dec. 29, 1905. Serial No. 293,697.

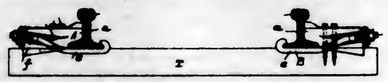
Claim.—1. As a new article of manufacture, a pressed wear-plate of the character described having a projection, and a reinforcing-plate cut into said wear-plate at the location of said projection, substantially as set forth.

2. As a new article of manufacture, a pressed wear-plate of the character described having a projection at its upper side, and a seat beneath said projection, and a reinforcing-plate secured to said seat, substantially as set forth.



3. As a new article of manufacture, a pressed wear-plate of the character described having a projection at its upper side and a seat beneath said projection, and a reinforcing-plate having angle-joint engagement with said wear-plate within said seat, substantially as set forth.

813,875. APPLIANCE AND FIXTURE FOR RAILROAD RAILS AND TIES. FRANK W. FINK, Maneyo Corners, and PHILIP S. VAN WIE, Amsterdam, N. Y. Filed Sept. 28, 1904. Serial No. 226,541.



Claim.—1. A device of the character described comprising a block one end of which is provided with an overhang adapted to engage the side of a rail, whereby vertical adjustment of the latter is permitted, and an adjustable hook-bolt carried by said block.

2. A device of the character described comprising a block one end of which is provided with an overhang adapted to engage the side of a rail, whereby vertical adjustment of the latter is permitted, a hook-bolt carried thereby, and means for adjusting said bolt relatively to said block.

3. A device of the character described comprising a block one end of which is provided with an overhang adapted to engage the side of a rail, whereby vertical adjustment of the latter is permitted, said block being provided with a chamber or recess, and an adjustable hook-bolt having a stem located in said chamber or recess.

4. A device of the character described comprising a block one end of which is provided with an overhang adapted to engage the side of a rail, whereby vertical adjustment of the latter is permitted, said block being provided with a chamber or recess, and a nut working on said stem.

5. A device of the character described comprising a block one end of which is provided with an overhang adapted to engage the side of a rail, whereby vertical adjustment of the latter is permitted, said block being provided with a chamber or recess, a hook-bolt having a threaded stem located in said recess, a nut working on said stem, and a cushioned washer interposed between said nut and said block.

6. A device of the character described comprising a block one end of which is provided with an overhang adapted to engage the side of a rail, whereby vertical adjustment of the latter is permitted, means for securing said block to a tie, a hook-bolt and means for clamping said bolt against the rail.

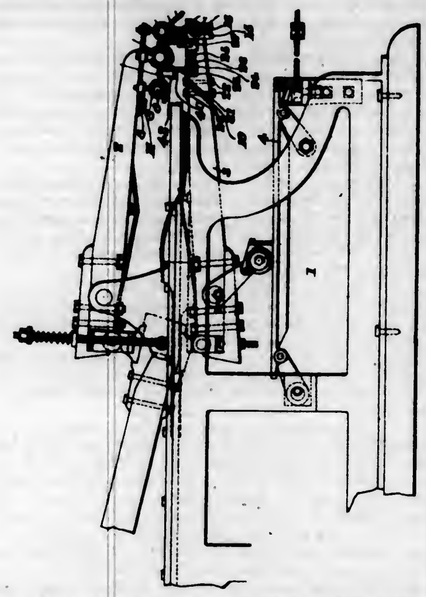
7. A device of the character described comprising a flange-block provided with converging grooves terminating in a chamber or recess, a yoke-like hook-bolt having arms located in said grooves, and a stem located in said chamber or recess, and means for adjusting said bolt relatively to said block.

813,876. ATTACHMENT FOR LEATHER-STAKING MACHINES. EUGENE F. PEAR, New York, N. Y., assignor of one-half to F. F. Slocomb & Co., a Corporation of Delaware. Filed Aug. 30, 1905. Serial No. 276,269.

Claim.—1. In a leather-staking machine, an upper jaw carrying an outer roll thereon, a lower jaw having a brushing device thereon, said roll and brushing device being in substantial alinement and coacting with each other.

2. In a leather-staking machine, an upper jaw carrying an outer roll thereon, a lower jaw having a brushing device thereon, and means for effecting the vertical adjustment of said brushing device.

3. In a leather-staking machine, an upper jaw carrying an outer roll thereon, a lower jaw having a brushing device thereon, and means for effecting the vertical adjustment of said brushing device, said roll and brushing device being in substantial alinement and coacting with each other.



4. In a leather-staking machine, an upper jaw carrying inner and intermediate rolls, a lower jaw having a buffing device thereon, and means for adjusting the position of said buffing device with respect to said rolls.

5. In a leather-staking machine, an upper jaw carrying inner and intermediate rolls, means for effecting independent vertical and lateral adjustment of said inner roll, a lower jaw having a buffing device thereon, and means for adjusting the position of said buffing device with respect to said rolls.

6. In a leather-staking machine, an upper and lower jaw, an inner, outer and intermediate roll attached to said upper jaw, a brush attached to said lower jaw, a blade secured to said lower jaw between said intermediate and outer rolls and a buffer secured to said lower jaw between said inner and intermediate rolls.

7. In a leather-staking machine, an upper and lower jaw, an inner, outer and intermediate roll attached to said upper jaw, said intermediate roll being larger than said inner and outer roll, a brush attached to said lower jaw, a blade secured to said lower jaw between said intermediate and outer rolls and a buffer secured to said lower jaw between said inner and intermediate rolls.

8. In a leather-staking machine, an upper and lower jaw, an inner, outer and intermediate roll attached to said upper jaw, a brush adjustably attached to said lower jaw, a blade adjustably secured to said lower jaw between said intermediate and outer rolls and a buffer adjustably secured to said lower jaw between said inner and intermediate rolls.

9. In a leather-staking machine, an upper and lower jaw, an inner, outer and intermediate roll adjustably secured to said upper jaw, a brush adjustably secured to said lower jaw under said outer roll, a blade adjustably secured to said lower jaw between said outer and intermediate rolls, and a buffer adjustably secured to said lower jaw between said inner and intermediate rolls.

10. In a leather-staking machine, an upper and lower jaw, an inner, outer and intermediate roll attached to said upper jaw, a brush secured to said lower jaw beneath said outer roll, a blade secured to said lower jaw between said outer and intermediate roll, a buffer secured to said lower jaw between said inner and intermediate roll and means for independently adjusting said brush with respect to said outer roll.

11. In a leather-staking machine, an upper and lower jaw, an inner, outer and intermediate roll secured to said upper jaw, a brush secured to said lower jaw, a blade secured to said lower jaw between said outer and intermediate roll, a buffer secured to said lower jaw between said intermediate and inner rolls and means for adjusting said buffer and blade with respect to said brush.

12. In a leather-staking machine, an upper and lower jaw, an inner, outer and intermediate roll secured to said upper jaw, means for independently adjusting each of said rolls, a brush secured to said lower jaw, a blade secured to said lower jaw between said outer and intermediate rolls, a buffer secured to said lower jaw between said inner and intermediate rolls and means for independently adjusting said buffer.

13. In a leather-staking machine, an upper and lower jaw, an inner, outer and intermediate roll secured to said upper jaw, said intermediate roll being larger than said inner and outer rolls, a brush adjustably secured tosaid lower jaw under said outer roll, a blade adjustably secured to said lower jaw between said intermediate and outer rolls, a buffer adjustably secured to said lower jaw between said inner and intermediate rolls and means for adjusting said buffer and said blade.

14. In a leather-staking machine having an upper and a lower jaw pivotally supported, a brushing device secured to the lower jaw, a plate fastened to the latter, perching and buffing devices secured on said plate and rolls secured to the upper jaw and adapted to hold the skin in engagement with said devices.

15. In a leather-staking machine having an upper and a lower jaw, pivotally supported, a brushing device adjustably secured to the lower jaw, a plate adjustably fastened to the latter, perching and buffing devices adjustably secured to said plate and rolls rotatably mounted on the upper jaw adapted to hold the skin in engagement with said device.

16. In a machine of the character described, a plate, slots in said plate, a perching device secured to the latter, a buffing device adjustable on said plate and located in the rear of said perching device, a brushing device in front of the latter adjustably secured to said lower jaw, each of said devices being independently adjustable, and a series of rolls rotatably mounted on the upper jaw and adapted to retain the skin in engagement with said devices as required.

17. In a machine of the character described, a plate adjustably secured to the lower jaw, a buffing device thereon, lugs on said plate, a bracket adjustably attached to said lugs, a staking device carried by said bracket, a brushing device adjustably secured to said jaw beyond said bracket and rolls mounted on the upper jaw adapted to retain the skin in engagement with said devices.

813,877. INSTRUMENT FOR REMOVING RIBS. ALBERTUS W. PRESTHUS and JAN SCHOUSHAKER, Leiden, Netherlands. Filed Jan. 7, 1905. Serial No. 240,116.

Claim.—1. An instrument for the separation and cutting through of ribs, comprising a pair of tongs, a hook carried by one member, said hook being approximately at right angles to the member and projecting in a direction away from the opposing member, and a knife carried by the said opposing member and having movement over the outer face of the hook.

2. An instrument for the separation and cutting through of ribs, comprising a pair of tongs, on one member of which at the outer end is a hook standing at right angles to the member, for encircling the rib while the other member likewise at the outer end is supplied with a flat knife standing at right angles thereto, said knife working in a guide on the member having the hook.

3. An instrument of the character described, comprising two members pivoted together intermediate of their ends, a knife jointed to the end of one member and projected inwardly, and a hook projecting outwardly from the end of the other member and over the outer face of which the knife has guided movement.

4. An instrument of the character described, comprising two members pivoted together intermediate of their ends, a knife secured to the end of one member and projecting inwardly, said knife being provided with a groove on its inner face, an inwardly-projecting toe on the end of the other member and having a projection en-

tering the groove of the knife, and an outwardly-projecting hook on the end of a member having the toe.

5. In an instrument of the character described, the combination with pivoted shanks, one of which is provided with a recess in its end, of a knife carried by said shank and coacting with the other shank, said knife being provided with spaced projections between which the recessed end of the shank extends, and a pin carried by the projections and engaging the recess of said shank.

6. In an instrument of the character described, the combination with pivoted shanks, of an inwardly-projecting knife secured to the end of one shank and provided with a longitudinal groove on its inner face, and an inwardly-projecting toe on the end of the other shank and provided with a projection corresponding in shape to the groove of the knife.

813,878. **CELLULOSE SOLUTION.** HENRI W. FREDERICK, Bleton, Belgium. Filed Aug. 23, 1905. Serial No. 275,226.

Claim.—1. The process for the production of solutions of cellulose consisting in subjecting cellulose of any origin to the dissolving action of solutions of cupric oxid alkylamin, substantially as described.

2. The process for the production of solutions of cellulose consisting in subjecting disintegrated cellulose of any origin to the dissolving action of solutions of cupric oxid alkylamin, substantially as described.

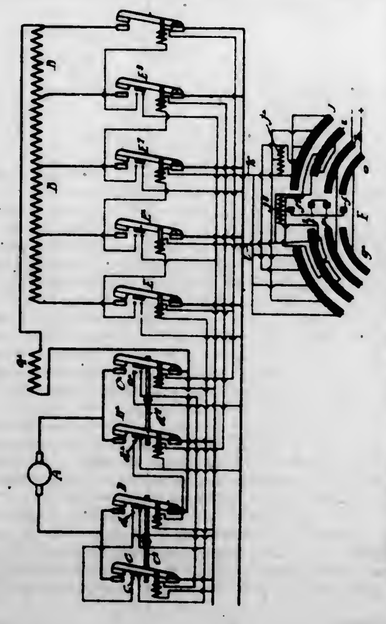
3. The process for the production of solutions of cellulose consisting in moistening cellulose with hot water, pressing, treating with a solution of caustic soda, adding copper sulfate, filtering, triturating the residue and adding a solution of an alkylamin, substantially as described.

4. The process for the production of solutions of cellulose consisting in moistening cellulose with hot water, pressing, treating with a solution of caustic soda, adding copper sulfate, filtering, triturating the residue and adding a solution of monomethylamin, substantially as described.

5. As a new composition of matter solutions containing cellulose and cupric oxid alkylamin, substantially as described.

6. As a new composition of matter solutions containing cellulose and cupric oxid monomethylamin, substantially as described.

813,879. **SYSTEM OF CONTROL FOR ELECTRIC MOTORS.** CHARLES D. GILPIN, Cleveland, Ohio, assignor to The Electric Controller & Supply Company, Cleveland, Ohio, a Corporation of Ohio. Filed Oct. 6, 1905. Serial No. 281,651.



Claim.—1. A system including a motor, means for reversing the same, speed-varying means including a series of independent electromagnetic switches, with a master-controller connected to said apparatus by but two conductors, and including means for governing the operation of said reversing and speed-varying means, substantially as described.

2. A system including a motor, means for controlling the same including speed-varying means and a reversing device, with a master-controller distant from said apparatus but connected thereto by but two conductors, said controller being connected to current-supply mains independently of the remainder of the system and constructed to govern the operation of the reversing and speed-varying means, substantially as described.

3. A system including a motor, a reversing switch or switches therefor, a body of resistance having controlling-switches, actuating means for said switches, with a master-controller having connections for governing the operation of the reversing and the resistance-controlling switches, and being connected to said apparatus by but two conductors, substantially as described.

4. A system including a motor, two pairs of switches connected to serve as a reversing device for said motor, a body of resistance, a series of controlling-switches therefor, a device for operating each of said switches, and a master-controller for governing the actuation of said devices, the elements of said controller, as well as said devices, being interconnected to permit of the use of but two conductors between the controller and the said switches, substantially as described.

5. A motor-controlling system including electromagnetic resistance-controlling switches, auxiliary switches controlled by said main switches and each connected in circuit with the coil of a switch designed to operate after the switch which controls it, current-supply mains adjacent to the switches, a master-controller relatively distant from the switches, independent connections from the master-controller to current-supply mains, and connections between the master-controller and the coils of the resistance-controlling switches, one end of each of the coils of successive switches being alternately connected through the auxiliary switches to different supply-mains adjacent to the switches and the other end of each of said coils being alternately connected through the master-controller to the mains at said controller, substantially as described.

6. A motor-controlling system including electromagnetic switches, auxiliary switches controlled thereby and each connected in circuit with the coil of a switch designed to operate after the switch which controls it, current-supply mains adjacent to the switches, successive switch-actuating coils being alternately connected to supply-mains of different polarity through said auxiliary switches, a master-controller, current-supply mains connected to said controller, and two conductors connecting said controller and the coils of the resistance-controlling switches, said master-controller including means whereby said two conductors are alternately connected to supply to a switch coil or coils a current of sufficient magnitude to actuate the switch thereof, substantially as described.

7. A motor-controlling system including a body of resistance, a series of electromagnetic controlling-switches therefor, a master-controller, and conductors connecting the controller and the coils of said switches, with connections between the said coils and other connections to the controller whereby the operation of said controller causes said conductors to carry to a switch coil or coils a current of a magnitude sufficient to operate the switch or switches thereof, substantially as described.

8. A motor-controlling system including a body of resistance, a series of electromagnetic controlling-switches therefor, a master-controller, two conductors connecting said controller and the coils of said switches, other conductors between the said coils, whereby the operation of the controller causes said two conductors to be supplied with a current of a magnitude sufficient to operate the switches, and means for causing said coils to be successively actuated, substantially as described.

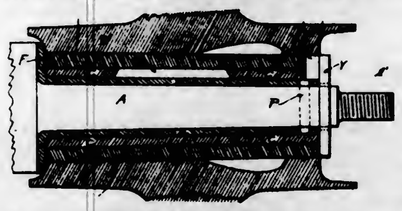
9. A motor-controlling system including a body of resistance, a series of electromagnetic resistance-controlling switches, a master-controller, conductors connected between the controller and the coils of the switches, and connections whereby the operation of said controller causes said conductors to alternately be supplied with a current of sufficient magnitude to operate the switch or switches therefor, with means for cutting down the current flowing through the conductor not so supplied to an extent sufficient to maintain closed the switches already closed but insufficient to close an open switch, substantially as described.

10. A motor-controlling system including a body of resistance, a series of electromagnetic resistance-controlling switches, a master-controller, conductors connected between the controller and the coils of the switches, and connections whereby the operation of said controller causes said conductors to alternately be supplied with a current of sufficient magnitude to operate the switch or switches therefor, with means for cutting down the current flowing through the conductor not so supplied to an extent sufficient to maintain closed the switches already closed but insufficient to close an open switch, substantially as described.

11. A motor-controlling system including a series of resistance-controlling electromagnetic switches, of which certain have auxiliary switches each in circuit with the coil of a switch designed to operate after it, one end of alternate coils being connected to one supply-main, and one end of the remaining coils being connected to a second supply-main, two conductors respectively connected to the second ends of said two sets of coils, with a master-controller connected to supply-mains and to said conductors having means whereby said conductors may at will be connected to the supply-mains in said controller to actuate said coils, substantially as described.

12. A system including a motor, a reversing switch or switches therefor, a body of resistance having controlling-switches, actuating means for said switches, with a master-controller having connections for governing the operation of the reversing and the resistance-controlling switches, there being direct connections from the current-supply mains to said controller and other independent connections from said mains to the switch-actuating means, substantially as described.

813,880. **AXLE-BEARING.** JOHN K. GOURDIN, Pineville, S. C., assignor of one-half to Robert L. Montague and Robert P. Tucker, Charleston, S. C. Filed Sept. 15, 1905. Serial No. 278,698.



Claim.—1. The combination substantially as herein described, of the spindle, the spindle-skein fitted over the spindle and having at its inner end the outwardly-turned flange, the cross-pin for holding the skein on the spindle, the hub-skein fitting over the spindle-skein and provided with an opening or openings for lubricant, and having in its outer end a slot, said hub-skein overlying the cross-pin for securing the spindle and spindle-skein together, whereby to prevent displacement of said pin, the hub, the hub-boxing fitted over the hub-skein, and covering the lubricant-opening therein and provided in its outer end with a slot coinciding with that in the hub-skein, and the washer fitted over the spindle and provided on its inner side with a lug entering the coincident slots in the hub-skein and boxing, all substantially as and for the purposes set forth.

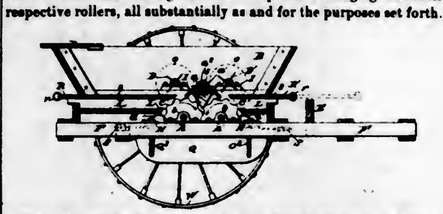
2. The combination with a hub, of a skein fitted therein and having an opening formed through it, and constituting a lubricant-chamber, and the hub-boxing fitted over said skein and covering the lubricant-chamber therein, coincident slots being formed in the outer ends of the boxing and skein and a washer having a lug entering said slots, substantially as set forth.

3. The combination with the hub, of the boxing held therein, and the hub-skein within the boxing, said boxing and skein being provided at their outer ends with coincident slots, and a locking device having a lug fitted in said slots for keying the boxing and skein together, substantially as set forth.

4. The combination with the spindle and the spindle-skein held thereon, of the hub, the hub-skein fitting over the spindle-skein, and the boxing within the hub and fitting over the hub-skein, said boxing and hub-skein being provided in their outer ends with coincident slots, and a washer having an inwardly-projecting lug entering the coincident slots, substantially as set forth.

813,881. **FERTILIZER-DISTRIBUTER.** JOHN K. GOURDIN, Pineville, S. C., assignor of one-half to Robert L. Montague and Robert P. Tucker, Charleston, S. C. Filed Sept. 15, 1905. Serial No. 278,694.

Claim.—1. The combination substantially as herein described, of the framing, the crushing and force-feed rollers corrugated longitudinally and meshing at their meeting faces, and having the depth of their corrugations comparatively shallow relative to the width of same, whereby gradual curvature is provided in the hollows of the corrugations, bearings and operating means for said rollers, the scraping-blades bearing at their free edges against the corrugated rollers, the pivoted saddles supporting said blades, the spring devices for actuating the blades, the hopper over the corrugated rollers, the feed device above the rollers and arranged intermediate the same and having the inclined feed-boards adjustably supported, the bottom boards arranged in front and rear of the feed device and movable toward and from the feed-boards, and the boards below the movable bottom boards and having flexible valve-plates bearing against their respective rollers, all substantially as and for the purposes set forth.



2. The combination substantially as herein described, of corrugated rollers meshing at their meeting faces and having the depths of their corrugations comparatively shallow relative to the width of the same, whereby a gradual curvature of the hollows of the corrugations is secured, and scraping-blades operating at their free edges in contact with their respective corrugated rollers, substantially as set forth.

3. The combination with the corrugated rollers, of the scraping-blades bearing at their free edges in contact with their respective rollers, the rocking saddles to which said blades are secured and springs operating upon the rocking saddles to press the blades against their rollers, substantially as set forth.

4. The combination of the hopper, the corrugated rollers meshing at their meeting faces, the feed device above the rollers and having the inclined feed-board discharging at their lower edges to their respective rollers, and the bottom boards movable toward and from their respective feed-boards whereby to vary or shut off the feed, substantially as described.

5. The combination in a fertilizer-distributer with the hopper, and the feed-rollers, of movable bottom boards whereby to shut off or regulate the feed, and boards below said movable bottom boards and provided at their inner edges with yielding devices bearing against the rollers, substantially as set forth.

6. The combination of the corrugated rollers meshing at their meeting faces, the feed device above said rollers and having inclined feed-boards discharging to their respective rollers, spring-actuated scraper-blades bearing against the rollers, the bottom board movable toward and from the inclined feed-boards, whereby to shut off or regulate the feed, said boards being arranged in series side by side, the boards below the movable bottom boards and having at their inner edges yielding devices bearing against their respective rollers, the pivoted boards extending longitudinally beneath the corrugated rollers, and means for adjusting the angle of said boards, substantially as set forth.

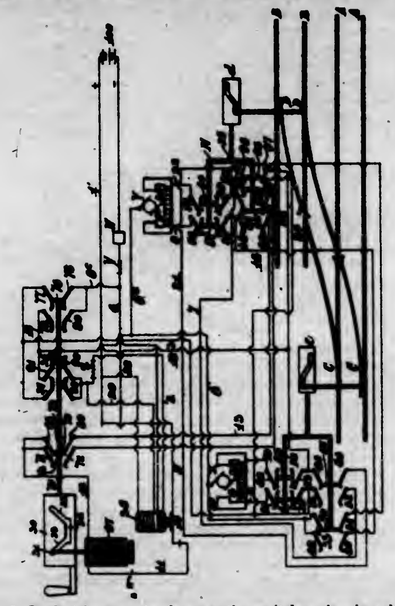
7. The combination of the hopper, the corrugated rollers, the feed device above the corrugated rollers, the boards forming a false bottom for the hopper and movable toward and from the feed device, the boards below the false-bottom boards and provided at their inner edges with yielding devices bearing against the corrugated rollers, and the scrapers below the latter boards and bearing against the rollers, substantially as set forth.

8. The combination with the framing, the hopper and the corrugated rollers meshing at their meeting faces, of the feed device above the corrugated rollers and provided with inclined feed-boards delivering at their lower edges to their respective rollers and adjustable toward and from said rollers, and the bottom boards movable in the hopper toward and from the feed-boards, substantially as set forth.

9. The combination with the framing, the hopper and the corrugated rollers, of a series of boards arranged side by side and movable longitudinally with relation to the corrugated rollers, whereby to control the feed of material thereto substantially as set forth.

813,882. **ELECTRIC SWITCH AND SIGNAL APPARATUS.** LAWRENCE GRIFFITH, Yonkers, N. Y. Filed Nov. 6, 1901. Serial No. 281,515.

Claim.—1. In electric apparatus for operating switches, signals, and the like comprising an electric indicator and a plurality of electrically-operated motion-plates or devices to be moved, means for preventing the action of the indicator while there is electric energy supplied to the operative means of any of said motion-plates.



2. In electric apparatus for operating switches, signals and the like having a plurality of electrically-operated motion-plates or devices to be moved, means for shunting current away from one or more of the operative means of said motion-plates when the apparatus is at normal or reverse positions.

3. In electric apparatus for operating switches, signals and the like having a plurality of electrically-operated motion-plates or devices to be moved, the combination of an electric indicator, means for shunting current away from one or more of the operative means of said motion-plates, with means for preventing the action of the indicator while there is electric energy supplied to any of the operative means of said motion-plates.

4. In electric apparatus for operating switches, signals and the like having a plurality of electrically-governed motion-plates or devices to be moved, means for shunting current away from one or more of the governing devices of said motion-plates when the apparatus is at normal or reverse position.

5. In electric apparatus for operating switches, signals, and the like, comprising an electric indicator and a motion-plate or device to be moved electrically operated in two directions, electric means separate from the indicator for preventing the action of the indicator while there is electric energy supplied to the operative means of said motion-plate.

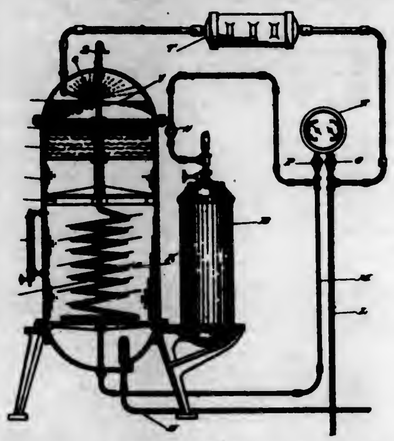
6. In electric apparatus for operating switches, signals, and the like, comprising an electric indicator and a motion-plate or device to be moved electrically operated in two directions, means for preventing the action of the indicator while there is electric energy supplied to the operative means of said motion-plate, which consists of a relay adapted to break the electric connection of said indicator at said time.

7. In electric apparatus for operating switches, signals, and the like, having a motion-plate or device to be moved electrically operated in two directions, means for shunting current away from the operative means of said motion-plate when the apparatus is at normal or reverse position.

8. In electric apparatus for operating switches, signals, and the like, having an electrically-operated motion-plate or device to be moved, the combination of an electric indicator, means for shunting current away from the operative means of said motion-plate, with means for preventing action of the indicator while there is electric energy supplied to the operative means of said motion-plate.

9. In electric apparatus for operating switches, signals, and the like, having an electrically-operated motion-plate or device to be moved, the combination of an operator's switch for said apparatus having contacts for shunting current on the circuit of the operative means of said motion-plate when the apparatus is at normal or reverse position back to battery, with a fuse or cut-out device in said operative circuit.

813,883. **APPARATUS FOR CARBONATING LIQUIDS.** PAUL G. HAAS, New Brunswick, N. J., assignor to James Donald Pickard, East Orange, N. J. Filed Nov. 4, 1904. Serial No. 231,251.

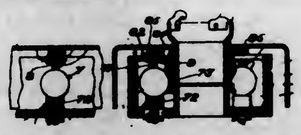


Claim.—1. A liquid-carbonating apparatus, comprising a containing-tank for liquid and gas under pressure; a liquid-inlet-governing float, arranged to carry a nozzle adapted to spray the liquid upwardly through an atmosphere of compressed gas, to form a combination of the liquid and the gas.

2. In a liquid-carbonating apparatus comprising a tank for liquid and gas under pressure, an upwardly-coiled perforated gas-inlet pipe, having attached spiral deflecting-plates, and a superimposed perforated distributing-diaphragm to diffuse compressed gas through a body of liquid held in a receptacle

3. In a liquid-carbonating apparatus comprising a tank for liquid and gas under pressure, a gas distributing and diffusing inlet comprising a vertical perforated coil with spiral deflecting-plates attached thereto, having a superimposed casing containing a series of corrugated deflecting-plates surmounted by a stratum of porous material, to cause the union of liquid and gas held in the containing-receptacle, by bringing them into intimate contact under pressure.

813,884. **MACHINE FOR SPINNING AND TWISTING FIBROUS MATERIALS.** GEORGE O. HADFIELD, Fall River, Mass. Filed June 21, 1904. Serial No. 213,493.



Claim.—1. In a machine for spinning or twisting fibrous materials, in combination, a rotating spinning-ring, a ring-rail, and antifriction-rolls on the said ring-rail rotating on vertical axes, each roll having journal-bearings at the top and bottom thereof, and the peripheral portions of said rolls engaging with the corresponding portion of the ring to support the ring both vertically and horizontally.

2. In a machine for spinning or twisting fibrous materials, in combination, a rotating spinning-ring, a ring-rail, and antifriction-rolls on the said ring-rail supporting the ring both vertically and horizontally, the said rolls rotating on vertical axes and each roll having journal-bearings at the top and bottom thereof, the periphery of each roll making contact with that of the ring at two points only.

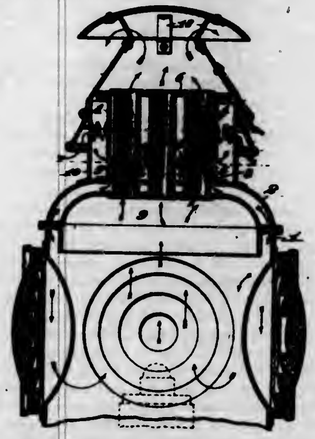
3. In a machine for spinning or twisting fibrous materials, in combination, a rotating spinning-ring, a ring-rail, antifriction-rolls on the said ring-rail rotating on vertical axes, the peripheral portions of said rolls engaging with the corresponding portion of the ring, a step-bearing for each roll furnished with an oil-cup from which the lubricant travels under the influence of centrifugal force to the contacting portions of the rolls and ring, and an upper journal-bearing for each roll.

4. In a machine for spinning and twisting fibrous materials, in combination, a rotating spinning-ring, a ring-rail, antifriction-rolls on the said ring-rail, the said rolls rotating on vertical axes, and having the peripheral portions thereof in engagement with the corresponding portion of the ring at two points only, a step-bearing for each roll furnished with an oil-cup from which the lubricant travels under the influence of centrifugal force to the contacting portions of the rolls and ring and an upper journal-bearing for each roll.

5. In a machine for spinning or twisting fibrous materials, in combination, a rotating spinning-ring, a ring-rail, antifriction-rolls on the said ring-rail rotating on vertical axes and having the peripheral portions thereof in engagement with the peripheral portion of the ring, each roll making contact with the ring at two points only, the walls of one of the contacting peripheral portions extending tangentially with respect to the opposing peripheral portion at the points of contact, the step-bearing for each roll furnished with the oil-cup, and the upper journal-bearing for each roll.

6. In a machine for spinning or twisting fibrous materials, in combination, a rotating spinning-ring, a ring-rail, antifriction-rolls rotating on vertical axes, each roll having journal-bearings at top and bottom thereof and the peripheral portions of the rolls engaging with the corresponding portion of the ring to support the ring both vertically and horizontally, and the adjustable brackets or stands mounted upon the ring-rail and provided with the said journal-bearings.

813,885. **SIGNAL-LAMP.** ALEXANDER H. HAMBLAN, Jr., St. Louis, Mo. Filed Feb. 3, 1905. Serial No. 243,731.



Claim.—In a signal-lamp, the combination of a main casing having an apertured top, an inner air-inlet member surmounting said casing at the location of the perforation in the casing and having perforations in its lower end, a top plate secured to the upper end of said inlet member, a plurality of vent-tubes secured in said top plate and extending downwardly within the inlet member, a bell secured to the lower ends of said vent-tubes and spaced from the casing, and an outer air-inlet member surmounting said casing and surrounding the inner air-inlet member; said outer inlet member having perforations in its upper end.

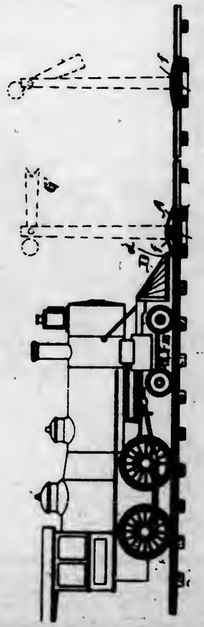
813,886. **BRIDLE.** HERMAN I. HAMMERSMITH, Hodgenville, Ky. Filed June 19, 1905. Serial No. 265,654.

Claim.—1. A bridle comprising side strips, a crown-piece, a brow-band and blinds or winkers secured to the side strips along a portion of their inner edges, the free ends of the blinds or winkers extending upwardly and bent forwardly and a winker-brace connecting the extreme ends of the blinds or winkers and attached to the brow-band whereby the main portions of the blinds or winkers are held braced in an outward direction at approximately right angles to the side strips.

2. A bridle comprising side strips, a crown-piece, a brow-band, blinds or winkers secured to the side strips along a portion of their inner edges, their free ends extending upwardly and inwardly and bent forwardly, and a winker-brace connecting the extreme ends of the blinds or winkers, and attached to the brow-band, whereby the main portions of the blinds are held braced in an outwardly direction at approximately right angles to the side strips.

3. A bridle, consisting of side strips, a crown-piece, and a brow-band mounted on the crown-piece, said brow-band having loops thereon, blinds or winkers secured to the side strips and extending outwardly, one end of the blinds projecting upwardly and inwardly, and means engaging said projecting portion, and passing over the brow-band and through the loops.

813,887. **TRAIN-CONTROLLING DEVICE.** JOHN C. HARDENBERGH, Cleveland, Ohio, assignor of one-fourth to Edwin S. Gaylord, Cleveland, Ohio. Filed May 20, 1905. Serial No. 261,716.



Claim.—1. The combination of a spring-bar having a pair of supporting-legs rigidly secured to railroad-ties, and means on the locomotive adapted to engage the upper surface of said bar, and means for holding said bar down in idle position.

2. A spring-bar bent to present an upward bulge and inwardly-extending legs whereby the upper surface of the bar may be inclined

upward in front of an approaching train or may be drawn down into idle position, combined with a rock-shaft for drawing the bar into such idle position.

3. In a train-controlling device, the combination of a spring-trip located at the track and an arm on the locomotive adapted to control an air-pipe, said arm being adapted to engage the upper surface of the trip and be swung thereby and means for bending the spring-trip downward out of the path of said arm.

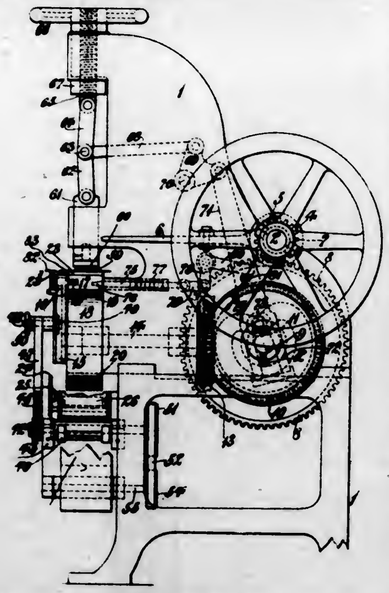
4. In a train-controlling system, the combination of a spring-trip consisting of a bar normally bulging upwardly and having supporting-feet approaching each other, and a rock-shaft connected with said bar to draw it down to idle position, and an arm on the locomotive adapted to engage the upper surface of the bar.

5. A trip comprising a bar of spring metal bent to present intermediately an upward bulge and having its two ends bent downwardly and inwardly for feet, there being a downwardly-depending member on the under side of the intermediate part of the bar, and a rock-shaft engaging such member to draw the trip down into idle position.

6. In a train-controlling device, the combination of a trip located at the track and an arm on the locomotive adapted to control an air-pipe, said arm operating to open the pipe on alternate actuations, and means under the control of the engineer for giving intermediate actuations to said arm.

7. In a train-controlling system, a spring-trip consisting of a bar normally bulging upwardly and having supporting-feet approaching each other, and a rock-shaft connected with said bar to bend it down to idle position, combined with a semaphore and a common operating system for the semaphore and trip.

813,888. **PRESS FOR PRINTING AND EMBOSSING.** CYRUS HAWKINS, Camden, N. J., assignor, by direct and mesne assignments, to The Hawkins Wilson Company, a Corporation of Pennsylvania. Filed Dec. 6, 1904. Serial No. 235,691.



Claim.—1. In a device of the character described, a reciprocating platen, a holder adapted to receive a bed to coöperate therewith and a rotary arm carrying said holder, said holder being pivotally mounted on said arm.

2. In a device of the character described, a reciprocating platen, a holder adapted to receive a bed to coöperate therewith, a rotary arm carrying said holder and a track upon which said holder is adapted to be guided.

3. In a device of the character described, a reciprocating platen, a holder adapted to receive a bed to coöperate therewith and a rotary arm with which said holder is radially connected.

4. In a device of the character described, a die-holder, a rotary arm carrying said die-holder and a track upon which said die-holder is adapted to move, means for holding said die-holder in contact with said track and means for leading the end of the die-holder in conformation with the track.

5. In a device of the character described, a reciprocating platen, a holder adapted to receive a bed to coöperate therewith, a rotary arm carrying said holder, a track upon which said holder is adapted to move and yieldable means for keeping said holder in contact with said track.

6. In a device of the character described, a reciprocating platen, a holder adapted to receive a bed to coöperate therewith, a rotary arm, a sliding carrier mounted on said arm and carrying said holder, a guide for said holder and means for yieldingly holding said carrier and said arm in proper position with respect to each other.

7. In a device of the character described, a die-holder, an arm, means for imparting rotary motion to said arm, a sliding carrier mounted on said arm and supporting said die-holder, a track upon which said die-holder is adapted to travel, said track having upper and lower flattened faces, a wiper adjacent the lower flattened face, and means for holding said die-holder in contact with said track in its movement thereon.

8. In a device of the character described, a reciprocating platen, a holder adapted to receive a bed to coöperate therewith, a rotary arm, means for imparting movement to said arm, a sliding carrier mounted on said arm and carrying said holder, a guide for said holder and means actuated by the movement of said holder for inking the bed carried by said holder.

9. In a device of the character described, a die-holder, a rotary arm carrying said die-holder, a track upon which said die-holder moves, flattened for imparting motion to said die-holder in a right line and a stationary wiper with which the die is adapted to contact simultaneously with the right-lined movement of said holder.

10. In a device of the character described, a die-holder, a rotary arm carrying said die-holder, a track upon which said die-holder moves, flattened for imparting motion to said die-holder in a right line, a stationary wiper with which the die is adapted to contact simultaneously with the right-lined movement of said holder, and guides for said die-holder for holding the same in proper alinement during its passage over the wiper.

11. In a device of the character described, a die-holder, a rotary arm carrying said die-holder, a track upon which said die-holder moves, flattened for imparting motion to said die-holder in a right line a stationary wiper with which the die is adapted to contact simultaneously with the right-lined movement of said holder, and wiping material carried by said wiping device and movable thereon.

12. In a device of the character described, a die-holder, a rotary arm carrying said die-holder, a track upon which said die-holder moves, flattened for imparting motion to said die-holder in a right line, a stationary wiper with which the die is adapted to contact simultaneously with the right-lined movement of said holder, wiping material passing over said wiping device, and means for presenting a fresh surface of said material at each revolution of the die-holder.

13. In a device of the character described, a die-holder, a rotary arm carrying said die-holder, a track upon which said die-holder moves, means for imparting motion to said die-holder in a right line, a stationary wiper with which the die is adapted to contact simultaneously with the right-lined movement of said holder, wiping material passing over said wiping device, and means for presenting a fresh surface of said material at each revolution of the die-holder, said means being actuated by the movement of said rotary arm.

14. In a device of the character described, a die-holder, an arm, means for imparting rotary movement thereto, a sliding carrier mounted on said arm and pivotally connected with the said die-holder, a spring for retaining said sliding carrier and holder in proper position with respect to said arm, a track upon which said die-holder travels, and a second spring adapted to assist in holding said die-holder in proper contact with said track.

15. In a device of the character described, a die-holder, an arm, means for imparting rotary movement thereto, a sliding carrier connected with said arm and pivotally connected with said die-holder, a segment carried by said rotary arm, an inking-fountain, inking means movable with respect to said fountain, and a gear connected with said inking means adapted to be engaged by said segment to rotate said inking means during the passage of the die-holder.

16. In a device of the character described, a die-holder, a track upon which said die-holder is adapted to travel, said track having a flattened upper face a counter-die and a lock adapted to engage with said die-holder when in its proper position on said flattened surface beneath said counter-die.

17. In a device of the character described, a die-holder, a track upon which said die-holder is adapted to travel, said track having a flattened upper surface a counter-die and automatic means for locking said die-holder when in its proper position on said flattened surface beneath said counter-die.

18. In a device of the character described, a die-holder, a track upon which said die-holder is adapted to travel, said track having a flattened upper face a counter-die, automatic means for locking said die-holder when in its proper position on said flattened surface beneath said counter-die, and means for releasing said locking device at the proper time.

19. In a device of the character described, a die-holder, a track upon which said die-holder travels and having a flattened upper face, a recess in said die-holder and a beveled pin suitably actuated in order to enter said recess and lock the die-holder in position.

20. In a device of the character described, a reciprocating plunger, a die-holder, a rotary arm to which said holder is pivotally attached and means adapted to lock said holder, when in its proper position beneath said reciprocating plunger.

21. In a device of the character described, a reciprocating plunger, a die-holder, a track upon which said holder is adapted to travel, said track having a flattened upper face and means adapted to lock said holder, when in its proper position on said flattened surface beneath said reciprocating plunger.

813,889. **CAR-BRAKE.** JOSEPH F. HEISSER, Haines, Oreg. Filed Mar. 13, 1905. Serial No. 249,843.

Claim.—1. In brake mechanism of the class described, the combination of a car-body, wheels, a brake-beam, a movable frame carried by the car-body and connected with the beam, and toggle-levers arranged to actuate said frame.

2. In brake mechanism of the class described, the combination of a car-body, a truck, a brake-beam, a movable frame applied to the car-body and connected with the beam, coacting toggle-levers connecting the truck to the frame aforesaid, and means for actuating said toggle-levers.

3. In brake mechanism of the class described, the combination of a car-body, spaced brake-beams, a toggle connection between said brake-beams, and toggle-levers operably connected with the toggle connection aforesaid.

4. In a brake, the combination of a car-body, a truck therefor embodying front and rear axles, wheels supported by said axles, brake-beams at opposite ends of the truck, brake-shoes supported by said brake-beams and adapted to engage the wheels of the truck and to be moved by said wheels after being engaged therewith, frames pivoted to the car-body and having rigid connection with the brake-shoes aforesaid, and other brake-shoes operatively connected with the frames and arranged between the front and rear axles of the truck.

5. In brake mechanism of the class described, the combination of a car-body, spaced brake-beams, toggle-links connected with said brake-beams, a pintle-bar connecting the toggle-links aforesaid, and operating means carried by the car-body and operably connected with opposite ends of the pintle-bar aforesaid.

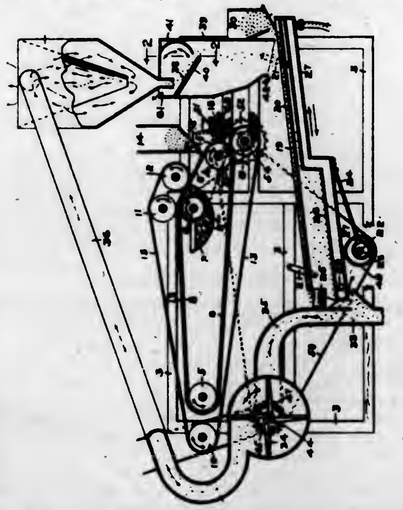
6. In brake mechanism of the class described, the combination of a car-body, spaced brake-beams, toggle-links connected with said brake-beams, a pintle-bar connecting the toggle-links aforesaid, a frame pivoted to the car-body, connections between said frame and the pintle-bar, and toggle-levers operably connected with the frame.

7. In brake mechanism of the class described, the combination of a car-body, a truck embodying front and rear axles, outer brake-beams at opposite ends of the truck for coöperation with the wheels, inner brake-beams arranged centrally of the truck, a toggle connection between the inner brake-beams, a movable frame carried by the car-body and operably connected with the toggle connection aforesaid, and means connecting the outer brake-beams with the movable frame.

8. In brake mechanism of the class described, the combination of a car-body, a truck embodying front and rear axles, outer brake-beams at opposite ends of the truck for coöperation with the wheels, inner brake means arranged centrally of the truck, a toggle connection between the inner brake-beams, a movable frame carried by the car-body and operably connected with the toggle connection aforesaid, means connecting the outer brake-beams with the movable frame, and toggle-levers operably connected with the movable frame and the truck for actuating the movable frame.

9. In brake mechanism of the class described, the combination of a car-body, front and rear trucks, a brake-beam supported by each of said trucks, a movable frame carried by the car-body adjacent each truck, a set of toggle-levers operably connecting the movable frame and the truck adjacent, and means for actuating the sets of toggle-levers of the trucks simultaneously.

813,890. **CLOVER-SEED-RECLEANING PROCESS.** SHIRL HERR, Lebanon, Ind. Filed Apr. 20, 1905. Serial No. 256,673.

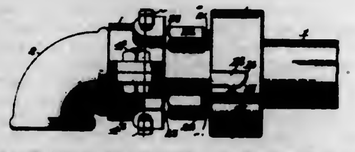


Claim.—1. The process of separating mixed seeds, which consists essentially in moistening the seeds, then bringing the seeds into contact with a comminuted material to which the undesirable seeds adhere but which material will not adhere to the good seeds, and then removing from the mass the undesirable seeds and material to which they adhere.

2. The process of separating mixed seeds, which consists essentially in moistening the seeds, then bringing the seeds into contact with a comminuted material to which the undesirable seeds ad-

here but which material will not adhere to the good seeds, then removing from the mass the undesirable seeds and material to which they adhere and then removing the remainder of said comminuted material from the good seeds.

813,891. LEAK-STOP. ARTHUR T. HUMMEL, Bradford, Pa. Filed May 2, 1905. Serial No. 258,858.



Claim.—1. The combination with an abutment-collar having a tapering bore, of a slip having a tapering outer face, a packing-collar carrying a packing-ring, and means causing a separation of the abutment-collar and the packing-collar to cause the slip to engage the pipes and the packing-ring to engage the joint to be packed.

2. The combination of a divided abutment-collar and a divided slip fitting within the bore of the collar.

3. The combination of a divided abutment-collar having a tapering bore, and a divided slip having a tapering outer face fitting within the bore of the collar.

4. The combination with a sectional abutment-collar, of a sectional slip fitting within the bore of the same, and means for securing a section of the slip to a section of the collar.

5. The combination with a sectional abutment-collar, of a sectional slip fitting within the bore of the same, and a dovetail connection between a section of the slip and a section of the collar.

6. The combination of a sectional abutment-collar having a tapering bore, a sectional slip having a tapering outer circumference and fitting within the bore of the collar, and means for securing a section of the slip to a section of the collar.

7. The combination of a divided abutment-collar having a tapering bore, and a divided slip fitting within the bore of the collar and having a tapering outer face and serrations on the interior.

8. The combination of the abutment-collar divided into sections and provided with non-circular pockets on one face thereof, and pressure devices comprising screws having non-circular heads adapted to be fitted in the pockets and turning-nuts having pointed ends.

9. The combination with the abutment-collar divided into two approximately semicircular sections, one of the sections having a lug on each side and the other section having a recess on each side to engage the lug and hold the sections together, of a tapering slip fitting the bore of the abutment-collar.

10. The combination with an abutment-collar divided into sections, of removable slip-sections carried by the sections of the collar.

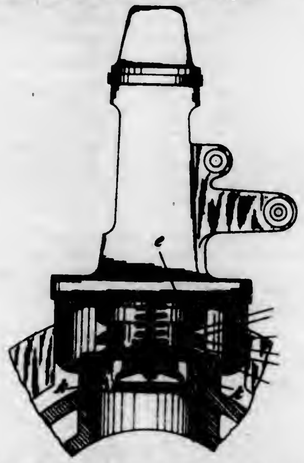
11. The combination of a sectional abutment-collar having a tapering bore, means securing the sections together and permitting a separation of the sections by a relative lateral movement of the sections, and a slip having a tapering outer circumference, fitted within the abutment-collar.

813,892. WRENCH. JOHN W. HELLSCHER and WILLIAM F. STAHLEY, Kokomo, Ind. Filed Apr. 11, 1905. Serial No. 254,979.

Claim.—A wrench comprising a carrier, a fixed jaw supported thereby, a movable jaw having a shank arranged at an angle thereto and provided with an abutting face, an operating-handle pivoted to the carrier, whereby the latter is adapted to tilt thereon, said handle having a cam-face to engage the abutting face of the shank and swing the pivoted jaw, and an adjusting device on the carrier to engage the handle, whereby the carrier may be adjusted on the handle to regulate the normal distance between the jaws.

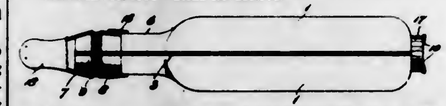
813,893. VALVE. MORITZ HOENVARD, Berlin, Germany. Filed Aug. 28, 1903. Serial No. 170,112.

Claim.—1. The combination of the valve-casing having a main valve-seat, a passage located on one side thereof and a cavity or recess adjacent to the passage; a valve adapted to seat on the main seat; and a trough-shaped ring positioned to cover the passage and overlap its walls when the main valve is closed and to connect the passage with the cavity after the main valve is open.



2. The combination of the valve-casing having a main valve-seat, a plurality of passages located on one side thereof, and a recess or cavity adjacent each passage; a valve adapted to seat on the main seat; and a plurality of trough-shaped members positioned to cover the passages when the main valve is closed and to connect the passages with the recesses or cavities after the main valve is open.

813,894. NURSERY-BOTTLE. BRIAN HOLLADAY, Richmond, Va. Filed June 10, 1904. Serial No. 211,974.



Claim.—1. As an article of manufacture, a bottle, comprising two longitudinally-separable sections having a temporary liquid-tight joint formed along their meeting edges, and a clamping means encircling the sections and serving to hold them together.

2. As an article of manufacture, a bottle, comprising two longitudinally-separable sections provided at their meeting edges with registering grooves, a removable packing located in the grooves, and a clamping means encircling the sections.

3. As an article of manufacture, a bottle comprising two separable longitudinal halves or sections, each comprising at one end the half portion of a neck and at its opposite end a half-round boss, and along its meeting edge having a groove, a packing located in the grooves, and clamping-rings fitting about the neck and bosses.

4. As an article of manufacture, a bottle comprising two longitudinal halves or sections, each half or section comprising a neck-section and a boss-section of a similar size, a packing inserted between the meeting edges of the sections, and clamping rings or bands encompassing the neck and boss sections.

5. As an article of manufacture, a bottle comprising two opposite longitudinal halves or sections, each half or section comprising a neck portion at one end and at the opposite end a half-boss having an inner beveled face, a suitable packing between the meeting edges of the two sections, and elastic rings or bands one of which encompasses the neck and another the two bosses.

6. As an article of manufacture, a bottle comprising opposing longitudinal halves or sections, and means for securing said halves or sections together, said bottle having its neck portion provided with an annular groove and in rear thereof reduced, and a rubber ring located in the reduced portion and adapted to become removably seated in the groove.

7. The opposite sections 1, 1, having grooves 2, neck 6 at one end provided with the reduced portions 7 and 8, an intermediate groove 9, and the half-bosses 10 at the opposite end, the packing within the grooves 2, the round rings 13 and 14 mounted respectively upon the neck and bosses, and suitable intermediate clamping-bands.

813,895. STREET AND STATION INDICATOR. DEAN A. HOLLENBECK, San Jose, Cal., assignor of one-half to Frank Check, San Jose, Cal. Filed Jan. 25, 1905. Serial No. 242,665.

Claim.—1. In a street or like indicator, cards having pins projecting from the ends of one side, disks mounted upon a horizontal revoluble shaft and having holes around the periphery to receive the pins, a ring turnably mounted upon the outer face of one of the disks, said ring forming a stop against which the ends of the pins contact and having a hole made through it to register with any of the pins and allow a card to be moved to disengage it from the disks.

2. In a street or like indicator, a shaft revoluble disks mounted thereon and having perforations around the periphery, cards having a length less than the distance between the disks and pins projecting from the ends of the cards near one side so as to enter the perforations, a ring fitting and turnable against the outer face of one of the disks, said ring having a hole made through it adapted to register with the pin of any card whereby the latter may be introduced or removed.

3. In a street or like indicator, a shaft revoluble disks mounted thereon and having perforations in their peripheries, cards having a length less than the distance between the disks and pins projecting from the ends of the cards near one side so as to enter the perforations, a ring fitting and turnable against the outer face of one of the disks, said ring having a hole made through it adapted to register with the pin of any card whereby the latter may be introduced or removed, stops against which the upper edges of the cards contact during the forward movement of the cards, an intermittently-operating mechanism by which the cards are disengaged singly from the stops and allowed to swing about the pivots into a pendent position.

4. In a street or like indicator, a shaft revoluble disks mounted thereon and having perforations in their peripheries, cards having a length less than the distance between the disks and having pins projecting from their ends near one side and adapted to enter the perforations, a ring fitting and turnable against the outer face of one of the disks and having a hole adapted to register with the pin of any card whereby the latter may be introduced or removed, stops against which the cards contact in their revolution toward the front and after passing the vertical plane, intermittently-acting mechanism for disengaging the cards singly from the stops to allow them to swing into a pendent position, and spring-latches over which the lower edges of the cards pass and by which they are retained in place.

5. In a street or like indicator, a carrier comprising horizontally-journaled disks having holes around their peripheries, cards with pins entering and loosely turnable in the holes, mechanism for intermittently rotating the disks, stops against which the cards contact after passing the vertical plane from the top of the carrier, said cards being individually released by each forward movement of the carrier, elastic latches engaging the lower edges of the cards as they fall into a pendent position, and rollers against which these edges move when passing downward.

813,896. CAR-LOCK. GUSTAVE HOLZ, Spicer, Minn. Filed Oct. 9, 1905. Serial No. 281,869.

Claim.—1. In an car-lock, the combination with a socket, of a yoke having a stem fitting said socket, said stem being bent at an angle to the plane of said yoke, and means for locking said car-lock against endwise movements with respect to said socket, when the said car-lock is in an operative position, substantially as described.

2. In an car-lock, the combination with a socket, of a yoke having a stem fitting said socket, said stem being bent at an angle to the plane of said yoke, means for locking said car-lock against endwise movement with respect to said socket, when the said car-lock is turned into an operative position, and arranged to be removed from said socket when the said car-lock is turned into an inoperative position, substantially as described.

3. In an car-lock, the combination with a socket, of a yoke having a stem fitting said socket, said stem being bent at an angle to the plane of said yoke, and said stem and said socket having a tongue and groove arranged to interlock, when the car-lock is turned into an operative position, substantially as described.

4. In an car-lock, the combination with a socket, of a yoke having a stem fitting said socket, said stem being bent at an angle to the plane of said yoke, said stem and said socket having a tongue and groove arranged to interlock, when said car-lock is turned into an operative position and arranged to permit endwise movement of said car-lock when the same is turned in an inoperative position, substantially as described.

5. In an car-lock, the combination with a socket 6 having a tongue 8, of a yoke 1 having a stem 2 fitting said socket 6, said stem 2 being bent at an angle to the plane of said yoke 1 and having an annular groove 3 adapted to receive the tongue 8 of said socket 2 when the car-lock is in an operative position, and having a notch 4 adapted to clear said tongue 8, to permit endwise movement of said car-lock when the same is turned in an inoperative position, substantially as described.

813,897. OVERSHOE-RETAINER. OCTAVE B. HUBBELL, Monroe, La. Filed Apr. 13, 1905. Serial No. 255,606.

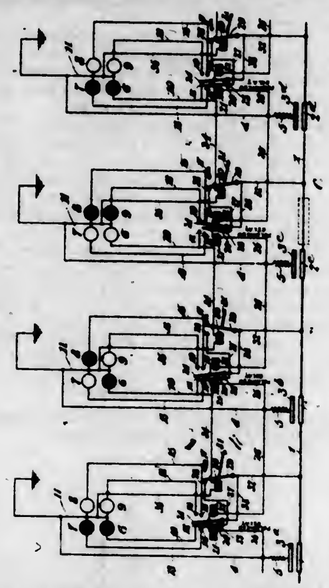
Claim.—The herein-described overshoe-retainer comprising a yielding ball or loop shaped shoe-engaging strip 2 designed to extend under the shank of the overshoe and provided with loops 3 at its upper ends, and a spring-metal clip 4 passed through the loops 3 on said shoe-engaging strip to attach the same to the ankle of the wearer, said retainer being disconnected from the shoe, substantially as described.

813,898. AUTOMATIC BLOCK-SIGNAL SYSTEM FOR ELECTRIC RAILWAYS. GRAY W. JOHNSTON and ALEXANDER E. ACKERMANN, New York, N. Y. Filed Apr. 26, 1905. Serial No. 257,209.

Claim.—1. In a block-signal system for electric railways, electrically-controlled signaling devices in each block, a polarized relay in each block for controlling the circuits to said signaling devices, and means, automatically thrown into operation by the entrance of a car into a block, for causing a flow of current through the relay in the same block in a direction opposite to that which previously passed therethrough, whereby the armature of said relay will be shifted, the circuits to the signaling devices in the same block will be varied, and a different signal will be displayed.

2. In a block-signal system for electric railways, signaling devices in each block, electric circuits controlling said signaling devices, contacts forming the terminals of said circuits, a polarized relay for each block whose armature is movable between and adapted to engage said contacts for alternately making and breaking said circuits, and means, automatically thrown into operation by the entrance of a car into a block, for causing a flow of current through the relay in the same block in a direction opposite that which previously passed therethrough, as and for the purpose set forth.

3. In a block-signal system for electric railways, a line conductor, contact-strips at the entrance to each block adapted to be electrically connected with said conductor by a contact device carried by the car, return-circuit wires leading respectively from said strips, electrically-controlled signaling devices in each block, a polarized relay in each block for controlling the circuits to said signaling devices, and circuits between the return-wires of each two adjacent blocks including said relays, as and for the purpose set forth.



4. In a block-signal system for electric railways, a line conductor, contact-strips at the entrance to each block adapted to be electrically connected with said conductor by a contact device carried by the car, return-circuit wires leading respectively from said strips, signaling devices in each block, electric circuits controlling said signaling devices, contacts forming the terminals of said circuits, a polarized relay for each block whose armature is movable between and adapted to engage said contacts, for alternately making and breaking said circuits, and circuits between the return-wires of each two adjacent blocks, including said relays, as and for the purpose set forth.

5. In a block-signal system for electric railways, signaling devices for each block, a polarized relay in each block for controlling the circuits to said signaling devices, and means, automatically thrown into operation by the entrance of a car or train into a block, for closing circuits through the relays of two adjacent blocks in opposite directions.

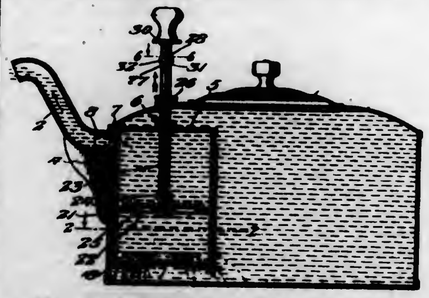
6. In a block-signal system for electric railways, signaling devices for each block, electric circuits controlling said signaling devices, contacts forming the terminals of said circuits, a polarized relay for each block whose armature is movable between and adapted to engage said contacts for alternately making and breaking said circuits, circuits leading from each relay to opposite ends of the block in which it is located, and means, thrown into operation by the entrance of a car or train into a block, for successively closing the latter circuits, whereby a flow of current is automatically caused to flow through the relays of two adjacent blocks in opposite directions, as and for the purpose set forth.

7. In a block-signal system for electric railways, signaling devices for each block, electric circuits controlling said signaling devices, contacts forming the terminals of said circuits, a polarized relay for each block whose armature is movable between and adapted to engage said contacts, for alternately making and breaking said circuits, an additional pair of contacts in each block, one constituting a second terminal of the circuit to one of said signaling devices and the other being electrically connected to one of the contacts of the armature of said relay, a magnet included in an auxiliary circuit leading from the circuit of one of the signaling devices in the next adjacent block, an armature for said magnet normally held in engagement with one of said additional contacts but movable between and adapted to engage the other of said additional contacts, when said magnet is energized, and means, automatically thrown into operation by the entrance of a car into a block, for causing a flow of current through the relay in the same block in a direction opposite that which previously passed therethrough, as and for the purpose set forth.

8. In a block-signal system for electric railways, a line conductor, contact-strips, at the entrance to each block, adapted to be electrically connected with said conductor by a contact device carried by the car, return-circuit wires leading respectively from said strips, signaling devices in each block, electric circuits controlling said signaling devices, contacts forming the terminals of said circuits, a polarized relay for each block whose armature is movable between and adapted to engage said contacts, for alternately making and breaking said circuits; an additional pair of contacts in each block, one constituting a second terminal of the circuit to one of said signaling devices and the other being electrically connected to one of the contacts of the armature of said relay, a magnet in an auxiliary circuit leading from the circuit of one of the signaling devices in the next adjacent block, an armature for said magnet normally held in engagement with one of said additional contacts but movable between and adapted to engage the other of said additional contacts, when said magnet is energized, and circuits between the return-wires of each two adjacent blocks, including said relays, as and for the purpose set forth.

9. In a block-signal system for electric railways, electrically-controlled signal devices in each block, a polarized relay in each block for controlling the circuits to said signal devices, means automatically thrown into operation by the entrance of a car into a block, for causing a flow of current through the relay in the same block in a direction opposite to that which previously passed therethrough, whereby the armature of said relay will be shifted, the circuits to the signaling devices in the same block will be varied, and a different signal will be displayed, and a circuit closed by said relay for displaying a signal in a preceding block.

813,899. KETTLE. ARCHIBALD T. KERNS, Peoria, Ill. Filed Mar. 7, 1905. Serial No. 248,901.



Claim.—1. The combination with a kettle, of a pump therein comprising a casing in open communication with the kettle-spout, a removable bottom for said casing, means for securing said bottom in position, a valve for said cylinder-bottom, arms connected to the valve and bearing against the cylinder-bottom for limiting the upward movement of the valve, a perforate piston movable lengthwise of the cylinder, a valve for said piston, means for limiting the upward movement of the valve, and a valve-stem connected with the piston and projecting through the kettle-top.

2. The combination with a kettle or the like, of a cylinder in open communication with the interior of the kettle, a piston within the cylinder, a projection from the cylinder engaging the interior of the kettle-spout, and a removable ring partially encircling the cylinder and removably engaging the kettle-wall.

3. The combination with a kettle or the like, of a pump therein comprising a cylinder removably secured at opposite ends to the kettle, said cylinder being open in communication with the kettle-spout at one end and kettle-body at the opposite end, and a piston within the cylinder and operable from without the kettle.

4. The combination with a kettle or the like, of a pump therein comprising a cylinder removably secured to the kettle, said cylinder being in open communication with the kettle-spout at one end and having valve communication with the kettle-body at the other end, a piston within the cylinder and means movable from without the kettle for operating the piston.

813,900. PROTECTING DEVICE FOR PNEUMATIC TIRES. EMILE LAPIERRE, Blood, France. Filed Sept. 2, 1905. Serial No. 276,886.

Claim.—1. A protecting device for pneumatic tires, formed by a strip of suitable material which is of sufficient width to wrap the cover of the pneumatic tire and to be secured between the flange of the rim and the flange of the said cover, and which is provided with flat heels practically at right angles with respect to the lateral portions; and hooking devices each composed of a metal plate having an outwardly-opening bight abutting on the flange of the rim of the wheel and provided with means by which it is secured to the flange of the protecting device.

2. A protecting device of a width enabling it to wrap the cover of the pneumatic tire, flanges formed at right angles on its edges to be nipped between the flange of the rim and the flange of the cover, and hooking devices each formed of a metal plate provided with a bight to abut on the flange of the rim and with a second bight to abut on the flange or heel of the protecting device, with means for securing the second bight on the protecting device.

3. In vehicle-wheels provided with pneumatic tires, a protecting device of sufficient width to be enabled to wrap the pneumatic tire, flanges formed at right angles on its edges, and hooking devices each formed of a metal plate provided with two bights opening in opposite directions, the one to abut on the flange of the protecting device, and the other and wider bight to abut on the flange of the rim of the wheel.

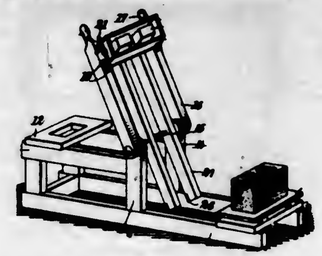
4. In a vehicle-wheel having a pneumatic tire, a hook to secure on the rim a protecting device provided with flanges, which hook is formed of a metal plate provided with a bight to abut on the rim of the wheel and with a second bight to abut on the flange of the protecting device, with rivet-holes and teeth to secure the same on the protecting device.

5. The combination with the rim of a vehicle-wheel having inwardly-extending flanges at its side edges, a pneumatic tire and cover for the same, which cover is provided with outer side flanges at its bottom portion, facing the flanges of the rim, a protective device for the tire, formed of suitable material of sufficient width to wrap the cover of the tire and having its lower edges carried out and held between the flanges of the tire cover and rim, and hooking devices each composed of a metal plate having an outwardly-opening bight which receives a flange of the rim, and means for attaching the plate to the protecting device where said device is located between the rim and the cover flanges.

6. A vehicle-wheel having forwardly-extending flanges at its outer side edges, a pneumatic tire having outwardly-extending side flanges located beneath the flanges of the rim, a protective covering for the tire, having its longitudinal edges carried outward and nipped between the flanges of the rim and the flanges of the tire, and locking devices for the protective covering, consisting of metal plates provided with bights which receive the flanges of the rim and bights which receive the longitudinal edges of the protective covering, and means for securing the second bights to the said protective covering.

813,901. MOLDING-MACHINE. PATTERSON G. LEMING, FRED EMERSON, and CHARLES W. GRANT, Urbana, Ill.; said Miller and Grant assignors to said Leming. Filed May 6, 1905. Serial No. 259,113.

Claim.—1. A block-molding machine having a pivoted frame, a mold thereon at a distance from the pivot of the frame, and two sills located at a distance from the pivot of the frame equivalent to the distance between the pivot and mold.



2. A block-molding machine having a pivoted frame, a mold thereon at a distance from the pivot of the frame, and two sills located at a distance from the pivot of the frame equivalent to the distance between the pivot and mold and on opposite sides of the pivot, whereby the frame is capable of carrying the mold from one sill to the other.

3. In a molding-machine, the combination of two sills, a frame pivoted at a point midway between them, a mold on the frame, a core, and means for automatically drawing the core from the mold when the frame is swung about its pivot.

4. In a molding-machine, the combination of two sills, a frame pivoted at a point midway between them, a mold on the frame, a core, and means for automatically drawing the core from the mold when the frame is swung about its pivot toward one sill; said means being constructed and adapted to operate before the mold reaches that sill.

5. In a molding-machine, the combination of two sills, a frame pivoted at a point midway between them, a mold on the frame, a core, and means for automatically drawing the core from the mold when the frame is swung about its pivot; said mold having separable walls, and spring-hinges by which the walls are connected to the main part of the mold.

6. In a molding-machine, the combination of two sills, a frame pivoted at a point midway between them, a mold on the frame, a core, and means for automatically drawing the core from the mold when the frame is swung about its pivot; said mold having separable walls, spring-hinges by which the walls are connected with the main part of the mold, and means for locking all of the walls in closed position.

7. In a molding-machine, the combination of a frame, a pallet-sill thereon, a tamping-sill, said sills being located at opposite ends of the frame and the tamping-sill being at a higher elevation than the pallet-sill, and a movable frame pivoted to the main frame at a point midway between said sills.

8. In a molding-machine, the combination of a frame, a pallet-sill thereon, a tamping-sill, said sills being located at opposite ends of the frame and the tamping-sill being at a higher elevation than the pallet-sill, a movable frame pivoted to the main frame at a point midway between said sills, and a mold located on said movable frame, the height of said mold being substantially equal to the distance in elevation of the two sills.

9. A molding-machine, comprising a pivoted frame, a mold thereon, a core, a bar connected with the core and pivotally mounted with respect to the frame, said bar having a projection, and means for engaging the projection to arrest the motion of the core while the frame is moving about its pivot.

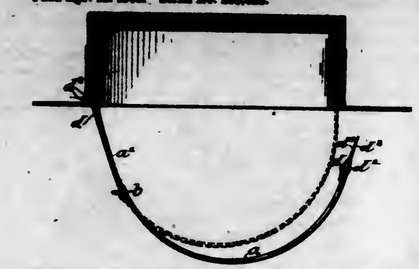
10. A molding-machine, comprising a movable frame, a mold thereon, a core, a bar connected with the core, said bar having a projection, and means for engaging the projection to arrest the motion of the core while the frame is in motion.

11. In a molding-machine, the combination of a frame, a pallet-sill thereon, a tamping-sill, said sills being located at opposite ends of the frame and the tamping-sill being at a higher elevation than the pallet-sill, a frame movably mounted on the main frame, and a mold located on the last-named frame.

12. In a molding-machine, the combination of two sills, a frame movably mounted between them, a mold on the frame, a core, and means for automatically drawing the core from the mold when the frame is moved from one sill to the other.

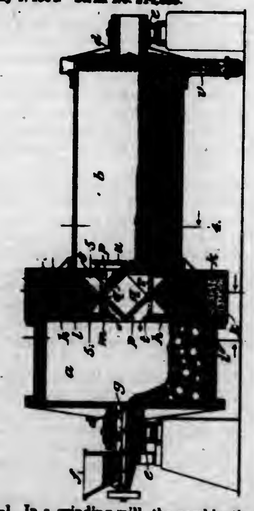
13. In a molding-machine, the combination of a sill, a frame movably mounted adjacent thereto, a mold on the frame, a core, and means for automatically drawing the core from the mold when the frame is moved toward said sill, said means being constructed and adapted to operate before the mold reaches the sill.

813,902. HAT-FASTENING. DANIEL LEBEN, New York, N. Y. Filed Apr. 11, 1905. Serial No. 255,033.



Claim.—A children's hat-fastening, comprising fastening devices adapted to be detachably secured to the hat-body, each consisting of a wire eye provided with means for piercing the hat-body so as to secure the device in position thereon, an elastic cord or band having one end secured to one fastening device and having the other end passed through the other fastening device and back on the body portion of the cord or band so as to form a loop, and a buckle at the junction of the free end with the body portion of the cord or band.

813,908. GRINDING-MILL. POUL T. LUNDGAARD, New York, N. Y. Filed July 1, 1904. Serial No. 214,869.



Claim.—1. In a grinding-mill, the combination of a grinding-drum to receive the material to be ground, a separator having a compartment formed therein to receive the partly-ground material from said drum and provided with means within the compartment for separating finely-ground material from the tailings, and a second grinding-drum to receive the finely-ground material from the separator and pulverize the same.

2. In a grinding-mill, the combination of a grinding-drum, means to deliver thereto material to be ground, a separator having a compartment formed therein, means to deliver the partly-ground material to the separator, and a second grinding-drum, said separator having means within the compartment adapted to deliver the finely-ground material to the second-named drum and also having means within the compartment adapted to return the tailings to the first-named drum.

3. In a grinding-mill, the combination of two grinding-drums, and an intermediate separator having a compartment formed therein, said separator having screens and partitions within its compartment and having inlet-openings meeting into the compartment, the separator being also provided with discharge-openings on one side of the screens communicating with one of the drums, and having discharge-openings on the other side of the screens communicating with the other drum.

4. In a grinding-mill, the combination of two grinding-drums, and an intermediate separating-drum, said separating-drum having therein a plurality of screens and having partitions behind each of said screens to catch the sifted matter, the drum also having inlet-openings near its periphery and discharge-openings near its center, both said inlet and discharge openings being on one side of the screens and communicating with one of the drums, the separating-drum also having discharge-openings upon the other side of the screens and communicating with the other of the drums.

5. In a grinding-mill, the combination of two grinding-drums and an intermediate separating-drum, said separating-drum having a plurality of curved screens, and having inlet-openings near its periphery and discharge-openings near its center, both said inlet and discharge openings being upon the concave sides of said screens and communicating with one of the drums, the separating-drum also having a partition upon the other side of each of the screens upon which the sifted matter is received and having a discharge-opening between each screen and the corresponding partition communicating with the other drum.

6. In a ball grinding-machine, the combination of a grinding-drum having relatively large and heavy balls, a second grinding-drum having relatively small and light balls, and an intermediate separating-drum, said separating-drum having within it a plurality of screens and a partition behind each of said screens to catch the sifted matter and also having inlet-openings near its periphery and discharge-openings near its center, both said inlet and discharge openings being upon one side of the screens and communicating with the drum having the larger balls, the separating-drum also having discharge-openings upon the other side of the screens communicating with the drum having the smaller balls.

7. In a grinding-mill, the combination of two grinding-drums, and an intermediate separating-drum, said separating-drum having within it a plurality of screens and partitions extending from near its center to its periphery and having inlet-openings on one side of the screens toward or near the periphery communicating with one of the drums, and also having two sets of discharge-openings toward or near the center, one set being on the same side of the screens and communicating with the same drum as the inlet-openings and the other set being on the other side of the screens and communicating with the other drum.

8. In a grinding-mill, the combination of two grinding-drums, and an intermediate separating-drum, said separating-drum having therein a plurality of screens and partitions extending from near its center to its periphery and having inlet-openings on one side of the screens toward or near the periphery communicating with one of the drums, and two sets of inclined plates within the separating-drum, the plates in one set extending from the same side of the screens on which the inlet-openings from one drum to the separating-drum are located, and the plates in the other set extending from the other side of the screens to the other drum.

9. In a grinding-mill, the combination of two grinding-drums, and an intermediate separating-drum, said separating-drum having therein a plurality of screens extending from near its center to its periphery, a plurality of partitions extending from the ends of the screens to the center of the separating-drum, a plurality of partitions extending from the center of the separating-drum to its periphery, the separating-drum having inlet-openings on the forward side of the screens communicating with one drum, and two sets of inclined plates, the plates in one set extending from the spaces between the forward sides of the screens and the second-named partitions to the same drum with which the inlet-openings communicate, and the other set extending from the spaces between the rear sides of the screens and the second-named partitions to the other drum, one set of plates crossing the first-named partitions which are cut off in front of the plates and the other set of plates crossing the second-named partitions which are cut off above the plates, and a central cylindrical structure through which the plates extend.

10. In a separating-drum for ball grinding-mills and the like, the combination of the ends or heads of the drum, having grooves extending from near the center toward the periphery, screens in the grooves, and a removable band around the periphery of the drum.

813,904. BOOT AND SHOE CLEANING AND POLISHING MACHINE. BENJAMIN F. LLOYD, Cherry Gardens, South Australia, Australia. Filed Aug. 11, 1904. Serial No. 220,267.

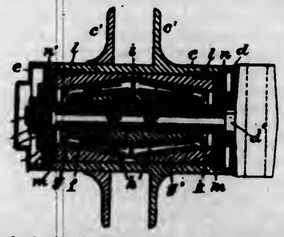
Claim.—1. In a boot cleaning and polishing machine, a reciprocating frame comprising two longitudinal members connected together by stays, stationary runners upon which the bottom portions of said stays slide, the said runners being supported by a suitable bed, brushes carried by said longitudinal members and arranged in pairs, thumb-screws for adjustably attaching the brushes to the longitudinal members so that the brushes can be moved in and out bodily to accommodate various sized boots, the connection between the screws and the brushes being loose so that the brushes may rock upon the screws to operate upon the back and front of the boots substantially as described and for the purpose set forth.

2. In a boot cleaning and polishing machine the combination with a reciprocating frame of brushes arranged in pairs and each having a concave face, and means for flexibly securing the brushes to the frame, the said means comprising a bridge-piece on the back of each brush, and a thumb-screw at the center of the bridge-piece, and securing it to the frame, the bridge-piece having a long pin at each end passing through a slot-opening in the frame substantially as described and for the purpose set forth.

3. In a boot cleaning and polishing machine the combination of a reciprocating frame, concave-faced brushes arranged in pairs, bridge-pieces secured to the backs of the brushes, one to each brush, thumb-screws attached at their points to the bridge-pieces and having their screw-threads engaging screw-threads in the frame, pins projecting from each end of the bridge-pieces to and through slot-openings in the frame, and spiral springs mounted upon the said pins between the bridge-piece and the frame, all substantially as described and for the purpose set forth.

4. In a boot and shoe cleaning and polishing machine, a reciprocating frame comprising two longitudinal members, arch-shaped metal stays connecting said members, stationary bars on which the lower ends of said stays are fitted to slide, brushes arranged in pairs, thumb-screws adjustable in the said longitudinal members, the said brushes being mounted to rock on the inner ends of said screws, and means for maintaining the brushes in an approximately horizontal position, substantially as described.

813,905. AUTOMOBILE-WHEEL BEARING. CHARLES S. LOCKWOOD, Newark, N. J., assignor to Hyatt Roller Bearing Company, Harrison, N. J., a Corporation of New Jersey. Filed May 6, 1903. Renewed Aug. 1, 1905. Serial No. 272,126.

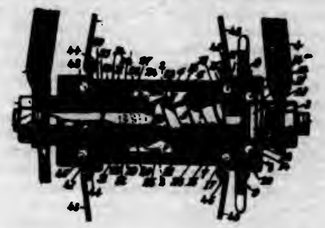


Claim.—1. A wheel-hub having the shell *e* with cylindrical bore, and a keyway and screw-threaded space at each end of the bore, and flanges *e'* for supporting the spokes, the journal *a*, having a double cone *f* tapered toward opposite ends, the tapered sleeves *g*, *g'*, fitted adjustably to the bore and having feathers *l* fitted movably to the keyways, the screw-collars *m* fitted to the threaded spaces for adjusting the sleeves, and rolls fitted between each double cone and sleeves and tapered in the same ratio as the cone and sleeve.

2. A wheel-hub having the shell *e* with cylindrical bore, and keyway and screw-threaded space at each end of the bore, and flanges *e'* for supporting the spokes, the journal *a* the double cone *f* thereon tapered toward opposite ends, the tapered sleeves *g*, *g'*, fitted adjustably to the bore the feathers *l* in the sleeves fitted movably to the keyways, the screw-collars *m* fitted to the threaded spaces for adjusting the sleeves, rolls fitted between each double cone and sleeves, the heads *n*, *n'* fitted to shoulders within the ends of the shell *e* to support the end thrust independently of the adjusting-collars, and the said journal having a collar at one end and adjustable nut at the other for adjustment to each heads.

3. A wheel-hub having the shell *e* with cylindrical bore, and keyway and screw-threaded space at each end of the bore, and flanges *e'* for supporting the spokes, the journal *a*, the double cone *f* thereon tapered toward opposite ends, the tapered sleeves *g*, *g'*, fitted adjustably to the bore the feathers *l* fitted movably to the keyways, the screw-collars *m* in the sleeves fitted to the threaded spaces for adjusting the sleeves, rolls fitted between each double cone and sleeves, the heads *n*, *n'*, fitted to shoulders within the ends of the shell *e* to support the end thrust independently of the adjusting-collars, the screw-cap *d* operating to clamp the head *n* rigidly against a shoulder within the shell, and the head *n'* being clamped to a shoulder within the opposite end of the shell, and the said journal having a collar at one end and nut at the other for adjustment to each heads.

813,906. BRAKE FOR BICYCLES. GUSTAV A. LOVE, Colusa, Minn. Filed Mar. 23, 1904. Serial No. 199,343.



Claim.—1. In a brake for bicycles, the combination with the driving-sprocket and hub of the rear wheel of the machine, of a rotatable member rigid with said sprocket and extending into the hub, the latter having an inner shoulder at one end, an expansible friction device mounted on the member, means for moving said device longitudinally of the member to engage said shoulder to expand the device on forwardly rotating the member with the sprocket, a stationary member with which the other end of the friction device has interlocking engagement, and springs for returning the parts to their normal position.

2. In a brake for bicycles, the combination with the driving-sprocket hub of the rear wheel of the machine, of a rotatable member rigid with said sprocket and extending into the hub, the latter having an inner shoulder at one end, an expansible friction device mounted on the member provided with teeth at one end, and means for moving said device longitudinally of the member to engage said shoulder to expand the device on forwardly rotating the member with the sprocket, said expansible device comprising longitudinally-separated sections, and a split clamping-ring therefor; a fixed member provided with teeth with which the teeth of the friction device are adapted to engage, and reversely-disposed springs engaging the rotatable member and the friction device.

3. In a brake for bicycles, the combination with the driving-sprocket and hub of the rear wheel of the machine, of a cone rigid with said sprocket and having an externally-threaded member rotating therewith and extending therefrom into said hub, an expansible friction device mounted upon and internally threaded in conformity with said member, and an inner abutment at one end of the hub, said friction device comprising longitudinally-separated sections, and a split clamping-ring therefor.

4. In a brake for bicycles, the combination with the driving-sprocket and hub of the rear wheel of the machine, of a rotatable member rigid with said sprocket and extending into the hub, an expansible friction device mounted on said member, and provided at its inner end with teeth, a stationary member having similar teeth, and means for expanding said device to engage with the hub on reversely rotating said first-named member with the sprocket, and also for forcing the teeth of the device into engagement with the teeth of said stationary member.

5. In a brake for bicycles, the combination with the driving-sprocket and hub of the rear wheel of the machine, of a rotatable member rigid with said sprocket and extending into the hub, an expansible friction device mounted on said member, and provided at its inner end with teeth, a stationary member having similar teeth, and means for expanding said device to engage with the hub on reversely rotating said first-named member with the sprocket, and also for forcing the teeth of the device into engagement with the teeth of

said stationary member, said friction device comprising longitudinally-separated sections, and a split clamping-ring.

6. In a brake for bicycles, the combination with the driving-

with a side outlet, and a recess in the base of the block, in combination with a receptacle adapted to bear against the outlet side of the

tudinally thereof while elevated and then below and to original position, and means to deposit piles of material on the carrying-piece.

nected with said carrying-pieces and its lower end fixed to a rock-shaft, a longitudinal slot provided in the body of the forked lever to

said stationary member, said friction device comprising longitudinally-separated sections, and a split clamping-ring.

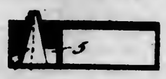
6. In a brake for bicycles, the combination with the driving-sprocket and hub of the rear wheel of the machine, said hub having an internal shoulder of a threaded rotatable member rigid with the sprocket and entering the hub from one end, said rotatable member having a reduced inner end formed with opposite slots, an expansible longitudinally-movable friction device mounted on said member, the latter being mounted on the axle in the hub, duplicate springs reversely disposed upon said end portion, with one of their extremities entering the slots, and the other turned outwardly and engaged by the friction device, and a stationary member forming an abutment for the friction device and engaging therewith to expand the same by reverse movement imparted to the rotatable member from the sprocket.

7. In a brake for bicycles, the combination with the driving-sprocket and hub of the rear wheel of the machine, said hub having an interior shoulder of a threaded rotatable member rigid with the sprocket and entering the hub from one end, said rotatable member having a reduced inner end formed with opposite slots, an expansible longitudinally-movable friction device mounted on said member, the latter being mounted on the axle in the hub, duplicate springs reversely disposed upon said end portion, with one of their extremities entering the slots, and the other turned outwardly and engaged by the friction device, and a stationary member forming an abutment for the friction device, and engaging therewith to expand the same by reverse movement imparted to the rotatable member from the sprocket, said friction device being internally threaded in conformity with said rotatable member, and comprising longitudinally-separated sections, and a split clamping-ring therefor.

8. In a brake for bicycles, the combination with the driving-sprocket, and the hub of the rear wheel, having a shoulder, of a rotatable member rigid with the sprocket-wheel and extending into the hub, a longitudinally-movable expansible friction device mounted on said member, springs reversely disposed upon the inner end of the rotatable member and engaging the rotatable member and the friction device, and a stationary member forming an abutment for the friction device and with which it has interlocking engagement.

9. In a brake for bicycles, the combination with the driving-sprocket, and the hub of the rear wheel having an internal shoulder at one end, of a rotatable member rigid with the sprocket-wheel and extending into the hub, said member having a reduced inner end, an expansible friction device mounted on said member and engaged thereby, springs reversely disposed upon the reduced end of the movable member and engaging the reduced end of the said member and the expansion device, and a stationary member forming an abutment for the friction device and with which it has interlocking engagement.

813,907. **TYPOGRAPHIC PAPER-PUNCH.** THAYER B. MELVIN, Allegheny, Pa. Filed July 11, 1905. Serial No. 269,208.



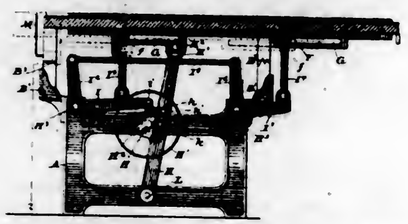
Claim.—1. A punch comprising a block provided with a perforating projection and a passage having a side outlet, and a receptacle having an open end adapted to be closed by the side of the block through which the outlet extends, said block and receptacle being coextensive in width and adapted to be conjointly locked in a chase, and being independent of one another.

2. A perforating attachment for printing-presses comprising a block provided with a punching projection and a passage communicating with said projection and having an outlet through one of the sides of the block, and a receptacle independent of the block and coextensive in width therewith, said receptacle having an open end adapted to bear against and to be closed by the side of the block through which the outlet extends.

3. A perforating attachment for printing-presses comprising a block having a punching projection and a passage communicating therewith, said passage having an outlet through one of the sides of the block, and a receptacle having an open end adapted to abut against and to be closed by the side of the block through which the outlet extends, said block and receptacle having interengaging portions to hold them in assembled relation.

4. A punch comprising a block provided with a tubular punching projection, a passage communicating therewith and provided with a side outlet, and a recess in the base of the block, in combination with a receptacle adapted to bear against the outlet side of the block and communicating with the passage and provided with a tongue or projection to fit within said recess.

813,908. **MACHINE FOR ASSEMBLING COLLAR-BLANKS.** HENRY C. MILLER, Waterford, N. Y. Filed Jan. 26, 1904. Serial No. 190,758.



Claim.—1. In combination with means for individually depositing plies of material, of means for elevating and feeding while elevated said deposited plies in regular advance to assemble a plurality thereof in a pile.

2. In combination with means for depositing plies of material, of a feeder for elevating and regularly advancing while elevated said plies between the depositing operations.

3. In combination with means for regularly depositing plies of material, of means for elevating and advancing while elevated said plies a distance equal to the distance between the deposited plies in normal position.

4. In combination with means for depositing a plurality of plies of material, of means for elevating and advancing while elevated said plies beneath the depositing means to receive an additional deposit therefrom.

5. In combination with means for depositing successive plies of material, of a feeder comprising a carrying-piece to elevate said plies and advance them while elevated to a position beneath the next successive depositing means.

6. In combination with a plurality of depositing means, of a table arranged lengthwise said depositing means, and a carrying-piece operative through the table and arranged to elevate said deposited plies above the table and move them longitudinally of the table while elevated a distance equal to the distance between the adjacent depositing means.

7. In combination with means for depositing plies of material, of a table to receive said plies, a carrying-piece movable through the table and means to elevate the carrying-piece and the deposited plies of material above the table and advance while elevated said carrying-piece and the deposited plies in regular order, whereby to assemble a plurality of said plies in a pile.

8. In combination with successively-arranged depositing means operative to simultaneously deposit a plurality of plies, of a table to receive said deposited plies, and means carried by the table to elevate above the table and to advance while elevated and lower each of said plies beneath the next successive depositing means.

9. In combination with successively-arranged depositing means operative to simultaneously deposit a plurality of plies, of a table to receive said deposited plies, and means carried by the table to simultaneously elevate above the table and advance while elevated and lower all of said plies a distance equal to the distance between the successive depositing mechanisms.

10. In combination with a plurality of pick-up mechanisms, of a table to receive material from said pick-up mechanisms, and means carried by the table to elevate above the table and advance while elevated and lower said material in regular order beneath the pick-ups, said means operating to advance the material between the depositing operations of the pick-up.

11. A feeder comprising a table, a carrying-piece movable through the table, and means to elevate the operative surface of said carrying-piece wholly above and out of contact with the table, move it longitudinally thereof while elevated, depress it below the table and return it to original position, and means to deposit plies of material on the carrying-piece.

12. A feeder comprising a slotted table, a carrying-piece movable in said slot, and means to move the operative surface of said carrying-piece wholly above and out of contact with the table and longitudinally thereof while elevated and then below and to original position, and means to deposit plies of material on the carrying-piece.

13. A feeder comprising a slotted table, carrying-pieces movable in the slots of the table, and mechanism to move the operative surface of said carrying-pieces wholly above and out of contact with the table and longitudinally thereof while in said elevated position, and means to deposit plies of material on the carrying-piece.

14. A feeder comprising a table formed with a plurality of slots, a carrying-piece arranged in each slot, a lever for moving the carrying-pieces longitudinally of the table, and means for elevating and depressing the carrying-pieces, said elevating means maintaining the operative surface of the carrying-piece wholly above and out of contact with the table during the feeding operation, and means to deposit plies of material on the carrying-piece.

15. A feeder comprising a table formed with a plurality of slots, a carrying-piece arranged in each slot, a lever for moving the pieces longitudinally of the table, levers for elevating and depressing the carrying-pieces prior to their longitudinal movement, and means for operating said levers, said elevating means maintaining the operative surface of the carrying-piece wholly above and out of contact with the table during the feeding operation, and means to deposit plies of material on the carrying-piece.

16. A feeder comprising a table formed with a plurality of slots, a carrying-piece arranged in each slot, a lever for moving the pieces longitudinally of the table, levers for elevating and depressing the carrying-pieces prior to their longitudinal movement, and a cam for operating said lever, said elevating means maintaining the operative surface of the carrying-piece wholly above and out of contact with the table during the feeding operation, and means to deposit plies of material on the carrying-piece.

17. The combination with a table comprising a series of parallel bars, of a series of carrying-pieces supported between said bars, the parallel bars forming vertical guides for the carrying-pieces, horizontal guides connected with the carrying-pieces, mechanism for elevating said pieces to move the upper edges thereof above the plane of the surfaces of the bars of the table, and returning the same to below the said surfaces, and mechanism for moving said blades forward and the reverse.

18. The combination with a table comprising a series of parallel bars arranged a short distance apart, a series of movable carrying-pieces, said bars serving to guide the whole series of said pieces in their movement, mechanism for imparting a reciprocating movement to said pieces in a vertical direction, and mechanism for imparting a reciprocating movement to said pieces in a horizontal direction, with each respective vertical movement alternating with each horizontal movement and means to deposit plies of material on the series of parallel pieces.

19. The combination with a frame, a stationary table comprising a series of bars separated from each other and supported by said frame, a movable bed comprising a series of parallel carrying-pieces provided each with an operative surface on the same plane as the others, a revolving shaft, mechanism actuated by said shaft to impart to the operative surface of all the blades a vertical upward movement wholly above and out of contact with the table, a forward horizontal movement while above the table, a downwardly-vertical movement, and a rearward horizontal movement below the surface of the table, and mechanism for guiding the pieces in their horizontal movement, and means to deposit plies of material on the movable bed.

20. The combination with a frame, a table comprising a series of stationary parallel bars and a bed of carrying-pieces, of a series of vertical stationary fingers projected above the surface of the table, a receptacle forward of said fingers, and mechanism for imparting to the series of said pieces a reciprocating longitudinal movement and a vertical reciprocating movement.

21. The combination with a frame, a stationary table provided with a series of parallel openings, a series of parallel carrying-pieces movable longitudinally in the parallel openings, a revolvable shaft supported by the frame, a cam mounted on the shaft, a wrist-pin carried by the cam, a lever forked at its upper end and loosely engaging a pin projecting from the carrying-pieces, the lever being formed with a slot to receive the wrist-pin, mechanism actuated by the cam, arms connected and actuated by said mechanism, devices for guiding the bed of carrying-pieces in their vertical movement, and devices for guiding the pieces in their horizontal movements.

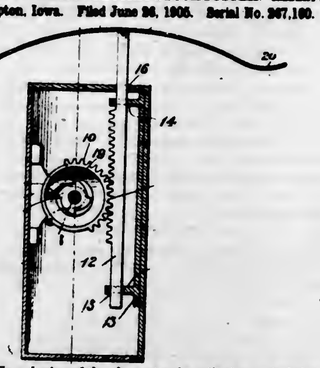
22. The combination with a stationary table provided with parallel openings, carrying-pieces mounted in said openings, a cam, a lever mechanism connected with the carrying-pieces and operated by the cam, a wrist-pin carried by said cam, a forked lever which is adapted to have a reciprocating movement with its forked upper end connected with said carrying-pieces and its lower end fixed to a rock-shaft, a longitudinal slot provided in the body of the forked lever to receive the wrist-pin, the rock-shaft being pivoted on the frame of the machine, and a drive-wheel for the parts.

23. The combination with a stationary table comprising a series of parallel sections with openings formed between the sections, a four-way moving bed comprising carrying-pieces guided in their respective movement in the openings of the table, mechanism for imparting to said bed a vertical reciprocating movement, mechanism for imparting to the bed a longitudinal reciprocating movement, with each vertical movement of the same alternating with each longitudinal movement, a series of stationary vertical fingers adjacent the discharge end of the bed, and between the carrying-pieces, the upper ends of the fingers projecting above the upper plane of said bed, and a receptacle at the discharge end of the movable bed for receiving pieces of material assembled on the same.

24. The combination with a frame, a carrying-bed operating on the frame, mechanism for intermittingly moving the carrying-bed to advance previously-deposited plies of material, means for reversing the movement of the bed, and means in the path of the bed for receiving the plies therefrom when the movement is reversed, and means against which the plies contact and are removed from the bed when the movement of the latter is reversed, to the means which receives the plies.

25. The combination with a frame, a carrying-bed operating on the frame, ply-removing means, mechanism for intermittently moving the carrying-bed to advance previously-deposited plies of material in front of the ply-removing means, means for reversing the movement of the bed, the reversal of the movement of said bed causing the ply-removing means to discharge the pile of plies from the bed.

813,909. **AUTOMATIC ELECTRIC BLOCK SYSTEM.** ALBERT M. MOTT, Hampton, Iowa. Filed June 26, 1905. Serial No. 267,160.



Claim.—1. In a device of the character described, a switch-box, a three-way switch on the side of said box, a cogged wheel on the switch, a cogged cap covering said cogged wheel, said toggle cap being held in position to allow the cap to rotate, which cap when rotated in one direction works the switch, and when rotated in the other direction permits the switch to remain stationary; a spring and ratchet or cogged plunger, adjusted to operate the cap, a roller attached to a portion of the train, and adjusted to operate the spring or plunger with each passage of the train.

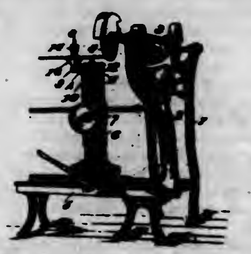
2. In a device of the character described, a switch-box, a switch within the box, a rotary member within the box, a spring-pressed pawl carried by the rotary member engaging the switch, a guide-bar arranged vertically within the box, and a plunger extending within the box held by the guide-bar, said plunger imparting motion to the rotary member.

3. In a device of the character described, a switch-box, a switch within the box, a rotary member within the box, a spring-pressed pawl carried by the rotary member engaging the switch, a guide-bar within the box, a perforated arm near each end of the bar, a plunger extending within the box and through the perforations of the arms, said plunger imparting motion to the rotary member.

4. In a block system, suitable feed and return wires, block-signals at each end of a block, conductors for each set of signals, a switch at the end of each block for controlling the current to the conductors, comprising in its construction a smooth box, a three-point switch thereon, a cogged wheel on the switch, a cogged cap cover-

ing said cogged wheel, said cogged cap being held in position to allow the cap to rotate, which cap when rotated in one direction works the switch, and when rotated in the other direction permits the switch to remain stationary; a spring and ratchet or cogged plunger, adjusted to operate the cap, a roller attached to a portion of the train, and adjusted to operate the spring or plunger with each passage of the train.

813,910. SAW ROUNDING AND JOINTING ATTACHMENT. JAMES R. MCCLELLAN, Madison, Wis. Filed Jan. 19, 1905. Serial No. 241,570.



Claim.—The herein-described circular-saw-jointing attachment comprising a bracket consisting of diverged arms, plates at the inner ends of the arms having hooks at their upper ends and a collar at the converged ends of the arms having a vertical opening, a spindle fitted in the opening of the collar, and a tapered centering-piece and bowl-shaped support slipped upon said spindle.

813,911. PROCESS OF PRODUCING CARBONACEOUS PIGMENTS. DAVID J. OCHEY, Cincinnati, Ohio. Original application filed Aug. 13, 1897, Serial No. 648,167. Divided and this application filed July 28, 1902. Serial No. 117,282.

Claim.—1. The process of producing black or dark-colored pigments by impinging carbonaceous flames produced on a moving source, on water in a state of motion.

2. The process of producing black or dark-colored pigments by impinging carbonaceous flame in motion on water in motion, said water containing suitable soluble material whereby the repellent properties of the carbonaceous deposit toward the water are diminished or overcome.

813,912. SPACE FOR JUSTIFYING LINES OF TYPE. DAVID B. RAY, Huntington, N. Y. Filed Apr. 28, 1904. Serial No. 204,516.

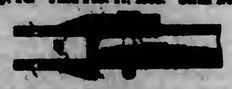
Claim.—1. A compressible space consisting of a main part or stem having its ends bent back along said main stem once only, whereby the space when compressed equals only two thicknesses of the material of which the space is made.

2. A compressible space consisting of a main part or stem, of non-elastic material, having its ends curved back along said main stem once only, said curved parts having their ends bent toward the middle part of said main stem.

3. A compressible non-elastic space having a main stem A, arch-shaped parts B B bent back from the ends of said main stem, said arch-shaped parts having one end movable along said main stem toward the middle thereof when the space is compressed, and resting on said main stem.

4. A compressible non-elastic space having a main stem and having its ends bent back along said main stem once only at each end in the form of an arch.

813,913. SUPPORT FOR POWER-CARRYING LINES. JOSEPH ELIAS, Oil City, Pa. Filed Feb. 17, 1905. Serial No. 245,165.



Claim.—1. In a carrying-line support, a line-clamp having a longitudinal channel, a pair of openings on opposite sides and near opposite ends of the channel, and grooves on the opposite sides of the channel; and J-shaped bolts fitted in the openings at one of their ends and extending into the grooves at the other of their ends.

2. In a carrying-line support, an upright provided with a recess, and a casting having a lug fitting in said recess.

3. In a carrying-line support, an upright having a recess, a casting having a lug fitting into said recess, and a U-shaped bolt surrounding the upright and secured to the casting.

4. In a carrying-line support, a swinging upright having a recess near its upper end; a bearing-casting having a pair of upwardly-extending ears; and a depending portion carrying a lateral lug for fitting in the recess in the upright; a U-shaped bolt surrounding the upright and secured to the casting; and a line-clamp pivoted between the ears of the casting.

5. In a carrying-line support, a trunnion-casting having an opening flared at its lower end, and a tubular upright fitted within the opening and flared.

6. In a carrying-line support, a trunnion-casting having an opening and a slot leading to the opening; an upright fitted within the opening; and a U-shaped bolt fitted into the slot to engage the upright and secured at its ends to the casting.

7. In a carrying-line support, a trunnion-casting having an opening therein, and lugs within the opening, and an upright resting on the lugs.

8. In a carrying-line support, a trunnion-casting having an opening flared at its lower end and lugs therein, and a tubular upright resting on the lugs and flared.

9. In a carrying-line support, a trunnion-casting having an opening flared at two opposite points, and lugs located between the flared portions; and a tubular upright fitting in the opening, notched at two opposite points and flared between the notched portions.

813,914. WIRELESS ELECTRIC SIGNALING SYSTEM. RAGNAR H. RUNDAHL, Berlin, Germany. Filed Aug. 19, 1905. Serial No. 274,904.

Claim.—1. A receiver arrangement for wireless electric signaling system in which a condenser is inserted in parallel to the indicator, the capacity of which condenser is at least twice as large as that of the indicator, and the damping of the indicator-circuit is so diminished by the diminution of its ohmic resistance that a diminution of the degree of coupling between the indicator-circuit and the receiver-circuit within certain limits has for a consequence an increase of the intensity in the indicator-circuit substantially as described.

2. A wireless electric signaling system in which the coupling between the indicator-circuit and the receiver-circuit is made so loose that the intensity in the indicator-circuit attains a maximum quantity with the object of obtaining a sharper tuning of the receiver-circuit with enlarged receiving capacity substantially as described.

813,915. APPARATUS FOR LAUNCHING SHIPS' BOATS. RICHARD H. RANDOLPH, Dartford, England. Filed July 6, 1905. Serial No. 268,599.

Claim.—1. In a boat-launching apparatus, the combination with the pivoting davits and means for operating same, of fixed chocks, movable chocks, and means for operating said movable chocks longitudinally and laterally relatively to said fixed chocks, substantially as described.

2. In boat-launching apparatus, the combination with the pivoting davits, of a fixed chock, a rotatably-mounted reciprocating shaft adjacent thereto, a second chock fixed to said shaft, and means for reciprocating and rotating said shaft, substantially as described.

3. In boat-launching apparatus, the combination with swiveling davits *a*, *a'* of a fixed chock *p*, a sliding and turning shaft *q*, a chock *p'* attached to said shaft-handle *r* jointed to shaft *q*, lever *t* turning on shaft *q*, pivot *e* on which lever *t* turns, all substantially as set forth.

4. In boat-launching apparatus, in combination with the sliding and turning shaft *q* fixed chock *p*, and movable chock *p'*, the brackets *x*, bent pins A fixed upon the shaft *q*, and entering holes in the brackets *x*, and rings *y* upon gripe *z*, substantially as set forth.

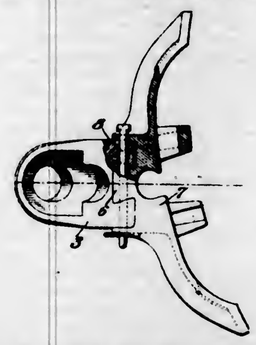
5. In boat-launching apparatus, the combination with the fixed and movable chocks, of a loosely-journaled roller interposed between the adjacent edge faces of said chocks, and means for operating said movable chock with relation to said roller and fixed chock, substantially as described.

6. In boat-launching apparatus, a combination with a sliding and turning shaft *q*, a fixed chock *p* and movable chock *p'*, of a handle *r* jointed to a stud G swiveling in a bracket H, and a bent link F jointed to the shaft *q* and the handle *r*, substantially as set forth.

7. In combination with the sliding and turning shaft *q*, fixed chock *p* and movable chock *p'*, the loose roller *w* upon the shaft *q*, between the chocks, and the pin K fixed to the movable chock *p'*, and passing through holes in the roller *w* and the fixed chock *p*, when the chock *p'* is vertical, substantially as set forth.

8. In boat-launching apparatus, the combination with the pivoting davits and tackle connection therebetween, a curved ratchet member adjacent one of said davits, a pawl member pivotally carried by said davit and coöperating with said ratchet member, and means for operating said other davit, substantially as described.

813,916. BRAKE-BEAM. HENRY B. ROSECRUPS, Kalamazoo, Mich., assignor to Chicago Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed Oct. 30, 1905. Serial No. 285,067.



Claim.—1. In a trussed brake-beam, the combination of a thrust-block and a removable brake-head, one of said parts having a horizontally-disposed tapered socket, and the other of said parts having a horizontally-disposed tapered projection for interlocking with said socket, the taper being so arranged as to permit longitudinal and outward removal of the brake-head, and a vertically-disposed wedge-key for engaging the locking projection in its socket; substantially as described.

2. In a trussed brake-beam, the combination with a thrust-block having a horizontally-disposed tapered socket widest at its outer end, of a removable brake-head having a horizontally-disposed tapered projection thereon for interlocking with said socket, a renewable brake-shoe carried by said brake-head, and a vertically-disposed wedge-key for locking the brake-head in position; substantially as described.

3. The herein-described thrust-block for trussed brake-beams, the same being provided with a horizontally-disposed tapered socket for the attachment of a brake-head; substantially as described.

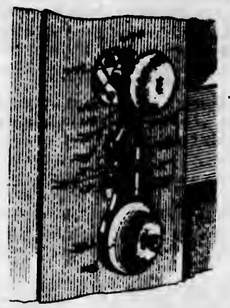
4. The herein-described brake-head for brake-beams, the same being provided with a horizontally-disposed tapered dovetailing projection for attachment to a thrust-block; substantially as described.

5. In a trussed brake-beam, the combination with a thrust-block and brake-head, one of said parts having a horizontally-disposed tapered socket and the other of said parts having a horizontally-disposed tapered projection for interlocking with said socket, said projection and the walls of the socket being recessed for the purpose described; substantially as described.

6. The herein-described thrust-block for trussed brake-beams, the same being provided with a horizontally-disposed tapered socket for the attachment of a brake-head, the walls of said socket being recessed or cut away to provide a vertically-disposed opening; substantially as described.

7. The herein-described brake-head for brake-beams, the same being provided with a horizontally-disposed tapered projection for attachment to a thrust-block, said projection being cut away or recessed at a point between its ends; substantially as described.

813,917. BURGLAR-ALARM. JOSEPH ROSEBROK and GENEVIEVE G. ROSEBROK, New York, N. Y. Filed Apr. 10, 1905. Serial No. 254,960.



Claim.—1. A device of the kind described, comprising a hanger having a shoulder portion, a frame pendulously suspended upon the shoulder, an alarm mechanism carried by the frame and comprising an escapement-wheel and an escapement-anchor, the latter having a rod and bell-clapper connected thereto, an arm extending from the said rod, a spring-actuated rod, carried by the frame, a pin connected to the last-mentioned rod, shoulder portions arranged upon the frame and adapted for engagement by the pin, all substantially as and for the purpose specified.

2. A device of the kind described, comprising a hanger having a shoulder portion, the outer end of which is flanged, a frame pendulously suspended from the shoulder, said frame comprising a lower circular portion having arms extending therefrom and by which the frame is supported upon the hanger, a cross-bar connecting the arms, said cross-bar having an aperture vertically arranged therein and also having a recess upon its lower side by which shoulders are provided upon the bar, a rod operating through the aperture and also through an aperture in the lower portion of the frame, a pin carried by the rod, a spring surrounding the rod and engaging a pin and the lower apertured portion of the frame, an alarm mechanism carried by the frame and comprising an escapement-wheel and an escapement-anchor for engagement with the wheel, a rod having a bell-hammer connected to the escapement-anchor, an arm connected to the rod, said arm having its free end arranged in position to be engaged by the bar carried by the frame all substantially as and for the purpose set forth.

3. A burglar-alarm comprising a hanger and frame, an alarm mechanism carried by the frame, a spring-actuated rod slidably and revolubly journaled in the frame, and engaging the hanger and escapement of the alarm mechanism, and means carried by the rod for engagement with the frame by which the mechanism may be locked against operation irrespective of the movement of the frame or hanger.

4. A burglar-alarm consisting of a hanger and a frame pendulously supported from the hanger, an alarm mechanism carried by the frame, a rod slidably and revolubly held in the frame and engaging the hanger and escapement of the alarm mechanism when the alarm is set, a pin connected to the rod, a spring surrounding the rod and engaging the frame and pin, said spring being adapted to operate the rod to release the escapement when the hanger is disengaged from the rod, and a shoulder formed upon the frame for engagement by the pin whereby the rod may be locked against movement irrespective of the movement of the hanger or frame.

5. A burglar-alarm comprising a hanger and frame, an alarm

2672 OFFICIAL GAZETTE: FEBRUARY 27, 1906.

FEBRUARY 27, 1906. U. S. PATENT OFFICE. 2673

ing said cogged wheel, said cogged cap being held in position to allow the cap to rotate, which cap when rotated in one direction works the switch, and when rotated in the other direction permits the switch to remain stationary; a spring and ratchet or cogged plunger, adjusted to operate the cap, a roller attached to a portion of the train, and adjusted to operate the spring or plunger with each passage of the train.

813,910. SAW ROUNDING AND JOINTING ATTACHMENT. JAMES R. HOLMLAND, Medina, Wis. Filed Jan. 19, 1905. Serial No. 241,570.

Claim.—The herein-described circular-saw-jointing attachment comprising a bracket consisting of diverged arms, pivoted at the inner ends of the arms having hooks at their upper ends and a collar at the converged ends of the arms having a vertical opening, a spindle fitted in the opening of the collar, and a tapered centering-piece and bowl-shaped support slipped upon said spindle.

813,911. PROCESS OF PRODUCING CARBONACEOUS PIGMENTS. DAVID J. CONLEY, Cincinnati, Ohio. Original application filed Aug. 13, 1897, Serial No. 648,167. Divided and this application filed July 26, 1902. Serial No. 117,202.

Claim.—1. The process of producing black or dark-colored pigments by impinging carbonaceous flames produced on a moving source, on water in a state of motion.

2. The process of producing black or dark-colored pigments by impinging carbonaceous flame in motion on water in motion, said water containing suitable soluble material whereby the repellent properties of the carbonaceous deposit toward the water are diminished or overcome.

813,912. SPACE FOR JUSTIFYING LINES OF TYPE. DAVID B. RAY, Huntington, N. Y. Filed Apr. 25, 1904. Serial No. 204,916.

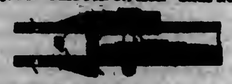
Claim.—1. A compressible space consisting of a main part or stem having its ends bent back along said main stem once only, whereby the space when compressed equals only two thicknesses of the material of which the space is made.

2. A compressible space consisting of a main part or stem, of non-elastic material, having its ends curved back along said main stem once only, said curved parts having their ends bent toward the middle part of said main stem.

3. A compressible non-elastic space having a main stem A, arch-shaped parts B B bent back from the ends of said main stem, said arch-shaped parts having one end movable along said main stem toward the middle thereof when the space is compressed, and resting on said main stem.

4. A compressible non-elastic space having a main stem and having its ends bent back along said main stem once only at each end in the form of an arch.

813,913. SUPPORT FOR POWER-CARRYING LINES. JOSEPH RUSS, Oil City, Pa. Filed Feb. 17, 1905. Serial No. 245,969.



Claim.—1. In a carrying-line support, a line-clamp having a longitudinal channel, a pair of openings on opposite sides and near opposite ends of the channel, and grooves on the opposite sides of the channel; and J-shaped bolts fitted in the openings at one of their ends and extending into the grooves at the other of their ends.

2. In a carrying-line support, an upright provided with a recess, and a casting having a lug fitting in said recess.

3. In a carrying-line support, an upright having a recess, a casting having a lug fitting into said recess, and a U-shaped bolt surrounding the upright and secured to the casting.

4. In a carrying-line support, a swinging upright having a recess near its upper end; a bearing-casting having a pair of upwardly-extending ears; and a depending portion carrying a lateral lug for fitting in the recess in the upright; a U-shaped bolt surrounding the upright and secured to the casting; and a line-clamp pivoted between the ears of the casting.

5. In a carrying-line support, a trunnion-casting having an opening flared at its lower end, and a tubular upright fitted within the opening and flared.

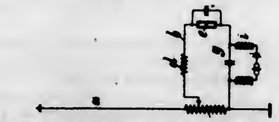
6. In a carrying-line support, a trunnion-casting having an opening and a slot leading to the opening; an upright fitted within the opening; and a U-shaped bolt fitted into the slot to engage the upright and secured at its ends to the casting.

7. In a carrying-line support, a trunnion-casting having an opening therein, and lugs within the opening, and an upright resting on the lugs.

8. In a carrying-line support, a trunnion-casting having an opening flared at its lower end and lugs therein, and a tubular upright resting on the lugs and flared.

9. In a carrying-line support, a trunnion-casting having an opening flared at two opposite points, and lugs located between the flared portions; and a tubular upright fitting in the opening, notched at two opposite points and flared between the notched portions.

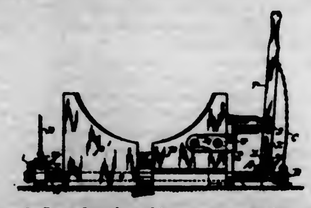
813,914. WIRELESS ELECTRIC SIGNALING SYSTEM. RAGNAR H. RUNDBAK, Berlin, Germany. Filed Aug. 10, 1903. Serial No. 174,904.



Claim.—1. A receiver arrangement for wireless electric signaling system in which a condenser is inserted in parallel to the indicator, the capacity of which condenser is at least twice as large as that of the indicator, and the damping of the indicator-circuit is so diminished by the diminution of its ohmic resistance that a diminution of the degree of coupling between the indicator-circuit and the receiver-circuit within certain limits has for a consequence an increase of the intensity in the indicator-circuit substantially as described.

2. A wireless electric signaling system in which the coupling between the indicator-circuit and the receiver-circuit is made so loose that the intensity in the indicator-circuit attains a maximum quantity with the object of obtaining a sharper tuning of the receiver-circuit with enlarged receiving capacity substantially as described.

813,915. APPARATUS FOR LAUNCHING SHIPS' BOATS. RICHARD H. ROGERSON, Dunfish, England. Filed July 6, 1905. Serial No. 268,889.



Claim.—1. In a boat-launching apparatus, the combination with the pivoting davits and means for operating same, of fixed chocks, movable chocks, and means for operating said movable chocks longitudinally and laterally relatively to said fixed chocks, substantially as described.

2. In boat-launching apparatus, the combination with the pivoting davits, of a fixed chock, a rotatably-mounted reciprocating shaft

adjacent thereto, a second chock fixed to said shaft, and means for reciprocating and rotating said shaft, substantially as described.

3. In boat-launching apparatus, the combination with swiveling davits *a*, *a'* of a fixed chock *p*, a sliding and turning shaft *q*, a chock *p'* attached to said shaft-handle *r* jointed to shaft *q*, lever *t* turning on shaft *q*, pivot *s* on which lever *t* turns, all substantially as set forth.

4. In boat-launching apparatus, in combination with the sliding and turning shaft *q* fixed chock *p*, and movable chock *p'*, the brackets *z*, bent pins A fixed upon the shaft *q*, and entering holes in the brackets *z*, and rings *y* upon grips *x*, substantially as set forth.

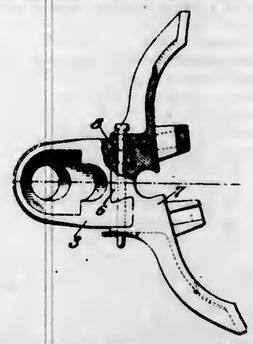
5. In boat-launching apparatus, the combination with the fixed and movable chocks, of a loosely-journaled roller interposed between the adjacent edge faces of said chocks, and means for operating said movable chock with relation to said roller and fixed chock, substantially as described.

6. In boat-launching apparatus, a combination with a sliding and turning shaft *q*, a fixed chock *p* and movable chock *p'*, of a handle *r* jointed to a stud G swiveling in a bracket H, and a bent link F jointed to the shaft *q* and the handle *r*, substantially as set forth.

7. In combination with the sliding and turning shaft *q*, fixed chock *p* and movable chock *p'* g the loose roller *w* upon the shaft *q*, between the chocks, and the pin K fixed to the movable chock *p'*, and passing through holes in the roller *w* and the fixed chock *p*, when the chock *p'* is vertical, substantially as set forth.

8. In boat-launching apparatus, the combination with the pivoting davits and tackle connection therebetween, a curved ratchet member adjacent one of said davits, a pawl member pivotally carried by said davit and coöperating with said ratchet member, and means for operating said other davit, substantially as described.

813,916. BRAKE-BEAM. HENRY B. ROBERTSON, Kalamazoo, Mich., assignor to Chicago Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed Oct. 30, 1905. Serial No. 285,087.



Claim.—1. In a trussed brake-beam, the combination of a thrust-block and a removable brake-head, one of said parts having a horizontally-disposed tapered socket, and the other of said parts having a horizontally-disposed tapered projection for interlocking with said socket, the taper being so arranged as to permit longitudinal and outward removal of the brake-head, and a vertically-disposed wedge-key for engaging the locking projection in its socket; substantially as described.

2. In a trussed brake-beam, the combination with a thrust-block having a horizontally-disposed tapered socket widest at its outer end, of a removable brake-head having a horizontally-disposed tapered projection thereon for interlocking with said socket, a renewable brake-shoe carried by said brake-head, and a vertically-disposed wedge-key for locking the brake-head in position; substantially as described.

3. The herein-described thrust-block for trussed brake-beams, the same being provided with a horizontally-disposed dovetailing tapered socket for the attachment of a brake-head; substantially as described.

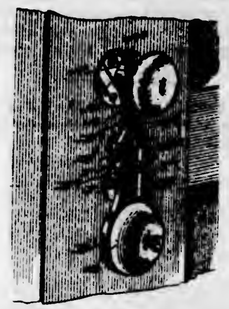
4. The herein-described brake-head for brake-beams, the same being provided with a horizontally-disposed tapered dovetailing projection for attachment to a thrust-block; substantially as described.

5. In a trussed brake-beam, the combination with a thrust-block and brake-head, one of said parts having a horizontally-disposed tapered socket and the other of said parts having a horizontally-disposed tapered projection for interlocking with said socket, said projection and the walls of the socket being recessed for the purpose described; substantially as described.

6. The herein-described thrust-block for trussed brake-beams, the same being provided with a horizontally-disposed tapered socket for the attachment of a brake-head, the walls of said socket being recessed or cut away to provide a vertically-disposed opening; substantially as described.

7. The herein-described brake-head for brake-beams, the same being provided with a horizontally-disposed tapered projection for attachment to a thrust-block, said projection being cut away or recessed at a point between its ends; substantially as described.

813,917. BURGLAR-ALARM. JOSEPH RODERICK and GENEVIEVE G. RODERICK, New York, N. Y. Filed Apr. 10, 1905. Serial No. 254,920.



Claim.—1. A device of the kind described, comprising a hanger having a shoulder portion, a frame pendulously suspended upon the shoulder, an alarm mechanism carried by the frame and comprising an escapement-wheel and an escapement-anchor, the latter having a rod and bell-clapper connected thereto, an arm extending from the said rod, a spring-actuated rod, carried by the frame, a pin connected to the last-mentioned rod, shoulder portions arranged upon the frame and adapted for engagement by the pin, all substantially as and for the purpose specified.

2. A device of the kind described, comprising a hanger having a shoulder portion, the outer end of which is flanged, a frame pendulously suspended from the shoulder, said frame comprising a lower circular portion having arms extending therefrom and by which the frame is supported upon the hanger, a cross-bar connecting the arms, said cross-bar having an aperture vertically arranged therein and also having a recess upon its lower side by which shoulders are provided upon the bar, a rod operating through the aperture and also through an aperture in the lower portion of the frame, a pin carried by the rod, a spring surrounding the rod and engaging a pin and the lower apertured portion of the frame, an alarm mechanism carried by the frame and comprising an escapement-wheel and an escapement-anchor for engagement with the wheel, a rod having a bell-hammer connected to the escapement-anchor, an arm connected to the rod, said arm having its free end arranged in position to be engaged by the bar carried by the frame all substantially as and for the purpose set forth.

3. A burglar-alarm comprising a hanger and frame, an alarm mechanism carried by the frame, a spring-actuated rod slidably and revolubly journaled in the frame, and engaging the hanger and escapement of the alarm mechanism, and means carried by the rod for engagement with the frame by which the mechanism may be locked against operation irrespective of the movement of the frame or hanger.

4. A burglar-alarm consisting of a hanger and a frame pendulously supported from the hanger, an alarm mechanism carried by the frame, a rod slidably and revolubly held in the frame and engaging the hanger and escapement of the alarm mechanism when the alarm is set, a pin connected to the rod, a spring surrounding the rod and engaging the frame and pin, said spring being adapted to operate the rod to release the escapement when the hanger is disengaged from the rod, and a shoulder formed upon the frame for engagement by the pin whereby the rod may be locked against movement irrespective of the movement of the hanger or frame.

5. A burglar-alarm comprising a hanger and frame, an alarm

mechanism carried by the frame, a spring-actuated rod revolubly and slidably mounted in the frame, and adapted for locking the alarm-sounding mechanism, a pin carried by the rod, a shoulder formed upon the frame for engagement by the pin whereby the said rod may be held into engagement with the alarm-sounding mechanism irrespective of the movement of the frame or hanger.

6. A burglar-alarm comprising a hanger and frame, said hanger having a shoulder upon which the frame is held, the said frame comprising a lower circular recessed portion and vertical-extending arms connected at their upper ends, a cross-bar connecting the arms intermediate their ends, an alarm-sounding mechanism connected to the circular portion of the frame, an arm projecting from the escapement of the alarm mechanism and extending into the said recess, a rod slidably and revolubly held in the said cross-bar and lower portion of the frame, said rod engaging the hanger at one end and the arm of the escapement at its opposite end, a pin carried by the rod, a spring surrounding the rod and interposed between the base of the frame and pin, shoulders formed upon the cross-bar connecting the arms of the frame and adapted for engagement by the pin of the rod whereby the said rod may be held into engagement with the said arm of the escapement irrespective of the movement of the hanger or frame.

813,918. TUBE, SINGLE OR COMPOUND, WITH LONGITUDINAL RIBS. ALBERT SCHMITZ, Raunheim, Germany. Filed Dec. 20, 1900. Serial No. 742,514.

Claim.—1. A tube composed of two tubular members, one of which has longitudinal ribs or wings, said members being formed from two skelps and being entirely welded together and the joints formed by the edges of the two skelps being out of alinement, substantially as described and for the purpose set forth.

2. A tube composed of two tubular members both of which have longitudinal ribs or wings, said members being formed from two skelps and being entirely welded together and the joints formed by the edges of the two skelps being out of alinement, substantially as described and for the purpose set forth.

3. A tube composed of two tubular members, one of which has longitudinal ribs or wings and the other of which contacts with the ends of said ribs or wings and is welded to the same, the members being formed from two skelps and having the joints formed by the edges of the skelps out of alinement, substantially as described and for the purpose set forth.

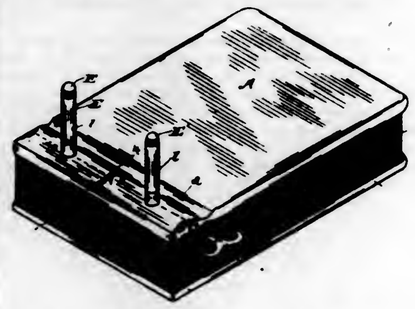
4. A tube composed of two tubular members both of which have longitudinal ribs or wings, each of said members resting against the ends of the ribs of the other member and being welded to said ribs, said members being formed from two skelps, the joints formed by the edges of the skelps being out of alinement, substantially as described and for the purpose set forth.

5. A tube composed of a plurality of tubular members one or more of which is provided with longitudinal ribs or wings, each of said ribbed members having the ends of its ribs resting against the smooth surface of the adjacent member and being welded to the same, the joints of two adjacent members being out of alinement, substantially as described and for the purpose set forth.

813,919. LOOSE-LEAF BINDER. WILLIAM J. SCHULTE, Cincinnati, Ohio. Filed Sept. 11, 1905. Serial No. 277,894.

Claim.—1. A loose-leaf binder comprising a set of covers, the one provided with leaf-receiving posts, the other provided with a casing in its one end having openings registering with said posts, a plate provided with a block at its one end having a screw-threaded opening therethrough, said plate being adjustably mounted within said casing, said plate adapted to fit about the posts, a threaded rod taking into the threaded opening of said block on said plate and adapted to be controlled from the outside of the casing whereby upon its operation the walls of the openings in said plate are brought into frictional contact with said posts.

2. A loose-leaf binder comprising a set of covers, the one provided with leaf-receiving posts, the second cover provided with a casing in its one end having openings therethrough registering with said posts, an adjustably-mounted plate within said casing provided with openings through which the posts are adapted to take, a plate intermediate of the posts and within said casing, and means adapted to be operated from the outside of said casing whereby the adjustably-mounted plate may be shifted and brought into frictional contact with the posts.



3. A loose-leaf binder comprising a set of covers, one of said covers provided with leaf-receiving posts, a second cover provided with openings adapted to register with the posts, an adjustably-mounted plate within said cover having openings through which said posts take, a reinforcing-plate intermediate of said posts and secured on said adjustable plate, a screw-rod taking into the adjustable plate and adapted to be operated from the outside of the cover whereby upon its operation the walls of the openings in said plate are brought into frictional contact with the leaf-receiving posts.

4. A loose-leaf binder comprising a set of covers, the one provided with leaf-receiving posts, the second cover provided with a casing at its one end having openings registering with the leaf-receiving posts, a plate within said casing provided with openings through which the posts extend, said plate provided with an enlarged and having a screw-threaded opening therethrough, a plate or strip within said casing and intermediate of the post-receiving opening and the screw-threaded openings in the first-mentioned plate and a screw-rod adapted to be operated from the outside of the casing and taking into the screw-threaded opening in said plate whereby the latter is adjusted and the walls of its openings brought into frictional contact with the posts.

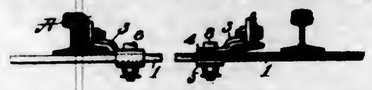
5. A loose-leaf binder comprising a set of covers, one of said covers provided with leaf-receiving posts, a second cover provided with a casing in its one end having openings registering with the posts, a plate adjustably mounted within said casing and having openings through which the posts extend, a reinforcing-plate intermediate of the openings in said plate, and means taking through said casing and controllingly connected with said adjustable plate whereby said plates are brought into frictional contact with the posts.

6. A loose-leaf binder comprising a set of covers, one of said covers having leaf-receiving posts, the second cover provided with a casing in its one end, said casing provided with openings registering with the leaf-receiving posts, a plate adjustably mounted within said casing and having openings through which the posts extend, said plate provided with a hooded end having a threaded opening therethrough, a bowed plate secured within said casing and adapted to extend intermediate of the hooded end of the adjustable plate and the opening therethrough, and means taking through the hooded end of the adjustable plate and bearing against the bowed plate whereby the walls of the openings in the adjustable plate and the hooded plate are brought into frictional contact with the leaf-receiving posts.

7. A loose-leaf binder comprising a set of covers, one of said covers provided with leaf-receiving posts, the other provided with a casing in its one end having openings registering with said posts, a plate adjustably mounted within said casing and provided with openings through which the posts extend, a screw-rod adapted to take through said casing and into the adjustable plate, and a bowed plate secured within said casing and extending intermediate of the end of the screw-rod and one of said leaf-receiving posts.

8. A loose-leaf binder comprising a set of covers, one of said covers provided with leaf-receiving posts, the other provided with a casing at its one end having openings registering with said posts, a plate adjustably mounted within said casing, and provided with openings through which the posts are adapted to take, a screw-rod adapted to take through said casing and into the adjustable plate, and means secured within said casing and extending intermediate of the end of the screw-rod and one of said leaf-receiving posts.

813,920. ADJUSTABLE SWITCH-ROD. WILLIAM H. SCOTT, Maplewood, Mo., assignor to Illinit Frog & Switch Company, East St. Louis, Ill., a Corporation. Filed Dec. 28, 1905. Serial No. 293,086.

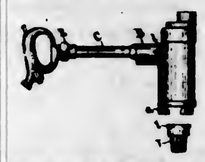


Claim.—1. In an adjustable switch-rod, the combination of a rod, an eccentric rotatably fitted in said rod, a bracket in which said rod is seated, and in a part of which is provided a non-circular bolt-hole, and a bolt passing through said bracket and having a non-circular shank portion seating in said non-circular bolt-hole, substantially as set forth.

2. In an adjustable switch-rod, the combination of a rod, an eccentric rotatably fitted in said rod, a bracket in which said rod is seated, and in a part of which is provided a star-shaped bolt-hole, and a bolt passing through said bracket and having a non-circular shank portion seating in said star-shaped bolt-hole; said star-shaped bolt-hole having a number of seats in multiple of the corners of the shank portion of said bolt, substantially as set forth.

3. In an adjustable switch-rod, the combination of a rod, an eccentric rotatably seated in said rod and provided with a non-circular bolt-hole, a bracket having a pair of arm members between which said rod is seated, and a bolt passing through said bracket-arm members, and having a non-circular shank portion; one of said bracket-arm members being provided with a circular bolt-hole and the other of said bracket-arm members being provided with a non-circular bolt-hole the latter of which is adapted to receive the non-circular shank portion of said bolt, substantially as set forth.

813,921. PNEUMATIC DOLLY. JAMES A. SHEPARD, Montour Falls, N. Y., assignor to The General Pneumatic Tool Company, Montour Falls, N. Y. Filed May 6, 1903. Serial No. 155,906.



Claim.—1. In a dolly, the combination of a barrel, a piston projecting therefrom, a die set eccentrically upon the end of the piston, a handle projecting from one side of the barrel, a longitudinal slot on the piston, a guiding member in the barrel in engagement therewith, whereby the piston is held from rotation with freedom to reciprocate and the die is held in fixed relation to the handle, and means for admitting fluid under pressure behind the piston.

2. In a dolly, the combination of a barrel, a piston projecting therefrom, a die set eccentrically upon the end of the piston, a handle projecting from one side of the barrel, a plurality of longitudinal slots on the piston, a spring-actuated locking-bolt in the handle offset to engage any one of said slots, and means for admitting fluid under pressure behind the piston.

3. In a dolly, the combination of a barrel, a piston projecting therefrom, a die set eccentrically upon the end of the piston, a handle projecting from one side of the barrel, a plurality of longitudinal slots disposed around the periphery of the piston, a locking-bolt in the handle offset to engage one of said slots, and means for admitting fluid under pressure behind the piston.

4. In a dolly, the combination of a barrel, a piston projecting therefrom, a die carried eccentrically upon the end of the piston, a handle projecting from one side of the barrel, means whereby the piston is held from rotation with freedom to reciprocate in the barrel, means for changing the position of the die relatively to the handle and means for admitting fluid under pressure behind the piston.

5. In a dolly, the combination of a barrel, a piston projecting therefrom, a die carried upon the end of the piston, a handle attached to one side of the barrel, means for shifting the position of the die relatively to the axis of the handle, and means for admitting fluid under pressure behind the piston.

6. In a dolly, the combination of a barrel, a piston projecting therefrom, a die carried upon the end of the piston, a handle attached to an offset at one side of the barrel, a coupling between said handle and offset whereby the handle may be turned and set at different angles with reference to the axis of the barrel, and means for admitting fluid under pressure behind the piston.

7. In a dolly, the combination of a barrel, a piston projecting therefrom, a die carried upon the end of the piston, an offset at one side of the barrel, a duct leading therefrom to the barrel behind the piston, a handle provided with a controlling-valve and lever, a tubular distance-piece between the offset and handle, a coupling whereby the handle may be turned and set at different angles upon the distance-piece, and means for connecting the handle with the fluid-supply.

8. In a dolly of the type described, the combination, with the piston, of a packing member, a spring-plate between said packing member and the piston, and a recess in the end of the piston to permit said plate to vibrate.

9. In a dolly of the type described, the combination of a piston having a socket in its inner end, a packing member for said end of the piston separate therefrom, and a guide-rod to which the packing member is secured, said rod projecting into the piston-socket and being free to move therein.

10. In a dolly of the type described, the combination, with the piston, of a packing member, a spring-plate interposed between said packing member and the piston, a guide-rod to which the packing member and the spring-plate are secured, a socket in the piston to receive the guide-rod, and a recess or counterbore in the end of the piston to permit said plate to vibrate.

11. In a dolly of the type described, the combination, with the piston, of an independently-mounted packing member, and a spring interposed between the piston and the packing member for the purpose set forth.

12. In a dolly of the type described, the combination, with the barrel, of a brace-coupling comprising a sleeve provided with wings adapted to be brought into interlocking engagement with lugs projecting from the end of the cylinder, and a screw in the sleeve adapted to be set up against the barrel-head when the sleeve is in place.

813,922. TAKE-DOWN SQUARE. CHARLES K. SITTON and JOHN H. WILLIAMS, Portland, Oreg. Filed Mar. 20, 1905. Serial No. 251,044.

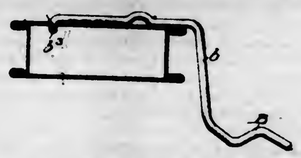
Claim.—1. As a new article of manufacture, the combination of two separable members *a*, *b*, the intersecting ends of which are respectively made with lips *a'*, *b'*; and interlocking shoulders, the line of one member being made with apertures like *c*, *f*, and the lip of the other member being provided with rotatable cams inserted in said apertures when the parts are assembled, and so arranged that the partial rotation of said cams will interlock the intersecting ends of said members substantially as described.

2. As a new article of manufacture, the combination of two separable members *a*, *b*, the intersecting ends of which are respectively made with lips *a'*, *b'*, and interlocking shoulders, the lips of one member being made with apertures like *c*, *f*, and the lip of the other member being provided with rotatable elliptical cams inserted in said apertures when the parts are assembled, and so arranged that the partial rotation of said cams will interlock the intersecting ends of said members substantially as described.

3. As a new article of manufacture, the combination of two separable members *a*, *b*, the intersecting ends of which are respectively made with lips *a'*, *b'*, having beveled inner edges and with beveled shoulders *d* for said inner edges to abut against; the lip of one member being made with apertures like *c*, *f*, and the lip of the other member being provided with rotatable cams inserted in said apertures and so arranged that the partial rotation of said cams will interlock the intersecting ends of said members substantially as described.

4. As a new article of manufacture, the combination of two separable members *a*, *b*, the intersecting ends of which are respectively made with lips *a'*, *b'*, having beveled inner edges and with beveled shoulders *d* for said inner edges to abut against; the lip of one member being made with apertures like *c*, *f*, and the lip of the other member being provided with rotatable, elliptical cams inserted in said apertures and so arranged that the partial rotation of said cams will interlock the intersecting ends of said members substantially as described.

813,923. SPRINGWORK. JOHN A. STAPLES, Newburgh, N. Y., assignor to Staples & Hanford Company, Newburgh, N. Y., a Corporation of New Jersey. Filed Apr. 9, 1903. Serial No. 151,889.



Claim.—1. A spring structure consisting of horizontal rails having permanent seats, spring-supports having angular ends adapted to be passed through said seats and interlocked with said rails, and springs carried by the supports.

2. A spring structure consisting of horizontal rails having seats, wires for supporting the springs and having angular ends entering the seats and lateral wings loosely engaging the rails; and springs on the wires.

3. In springwork, the combination with a frame having side rails provided with oppositely-disposed seats, drop-wires adapted when partially rotated to interlock with said seats, crossing wires arranged at intervals, and springs adapted to connect with both said wires at their points of crossing.

4. In springwork, the combination with a frame having side rails provided with oppositely-arranged holes, drop-wires having their ends bent to provide lateral wings adapted to said holes and to engage the under faces of the rails, crossing wires arranged at intervals, and springs adapted to interweave with said wires at their crossings.

5. A spring-support to engage the frame of springwork, consisting of a wire having vertical end hooks which terminate in wings lateral to the length of the wire and extending in the same direction.

6. In springwork, a pair of horizontal rails having holes, and a spring-support consisting of a wire having substantially vertical end hooks adapted to the holes and whose length is approximately the thickness of the wall of the rail, and lateral wings adapted to react against the rails.

7. In springwork, the combination with a frame composed of rails provided with oppositely-arranged holes, spring-supports composed of crossing wires adapted to said holes and having lateral wings to pass within the holes and out of register therewith, and springs connecting said wires at their crossings.

8. In springwork, the combination with a frame composed of hollow metallic rails provided with oppositely-arranged holes, spring-supports composed of corrugated crossing wires, the ends of said wires having hooks adapted to rest in said holes and lateral wings adapted to prevent displacement thereof, and springs interwoven with said wires at their crossings.

9. In springwork, a pair of horizontal rails having opposite seats, and a spring-support consisting of a wire having ends entering the seats and provided with lateral wings engaging the rails.

10. In springwork, a pair of rails having opposite holes, and a spring-support having angular ends adapted when the support is partially rotated to enter said holes and interlock with the rails.

11. In springwork, the combination with a pair of rails having opposite openings, and a spring-support provided at its ends with wings lateral to the said support and adapted to the openings and engaged therewith by partial rotation of the support.

813,924. SPRINGWORK. JOHN A. STAPLES, Newburgh, N. Y., assignor to Staples & Hanford Company, Newburgh, N. Y., a Corporation of New Jersey. Filed Apr. 28, 1904. Serial No. 205,626.

Claim.—1. In combination, a frame having opposite seats, and a rod provided with means at its ends interlocked with the seats and held against disengagement by the torsional resistance of the rod.

2. In combination, a frame having opposite seats, and a rod having its ends entering the seats and provided with wings held from disengagement with the frame by the torsional resistance of the rod.

3. In combination, a frame having opposite seats, a rod having its ends entering the seats and one of which ends is provided with a wing engaging the frame and held against displacement by the torsional resistance of the rod.

4. In combination, a frame having opposite seats, and a rod provided at its ends with vertical hooks adapted to the seats, and wings extending oppositely therefrom.

5. In combination, a pair of rails having opposite seats, and a rod provided at its ends with depending hooks entering the seats and oppositely-extending wings abutting against the rails.

6. In combination, a pair of rails having opposite openings, and a rod provided at its ends with oppositely-extending wings adapted to be sprung into the openings.

7. In combination, a pair of rails having opposite seats, a rod having hooks at the ends adapted to the seats, and oppositely and laterally extending wings engaging the rails and held against displacement by the torsional resistance of the rod.

8. In combination, a pair of rails having opposite seats, and a spring-support having angular ends entering the seats and one of which ends is sprung into its associated seat by putting the rod under torsion.

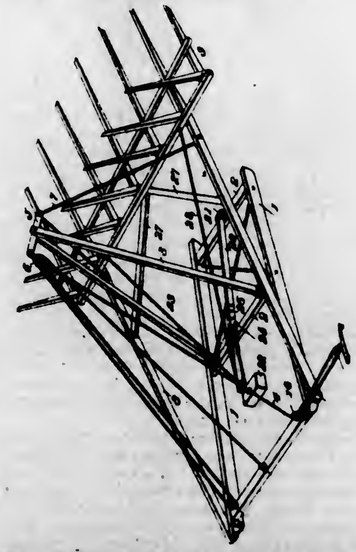
9. In combination, a pair of rails having opposite seats and a rod having lateral wings passing through the seats and one of which wings is entered into its associated seat by rotation of the same against the torsion of the rod.

10. In springwork, the combination with a frame having side rails provided with oppositely-arranged holes, crossing spring-supporting wires having their ends bent to provide oppositely-extending wings adapted to said holes and extending laterally therefrom in engagement with the rails, and springs interweaving with the said wires at their crossings.

11. In springwork, the combination with a frame composed of rails provided with oppositely-arranged holes, spring-supports composed of crossing wires adapted to said holes and having lateral wings to pass within the holes and out of register therewith and which are held against displacement by the torsional resistance of the supports, and springs connecting said wires at their crossings.

12. In springwork, the combination with a frame composed of rails provided with oppositely-arranged holes, spring-supports composed of corrugated crossing wires, the ends of said wires having hooks adapted to rest in said holes and oppositely-extending lateral wings adapted to engage the rails and prevent displacement thereof, and springs interwoven with said wires at their crossings.

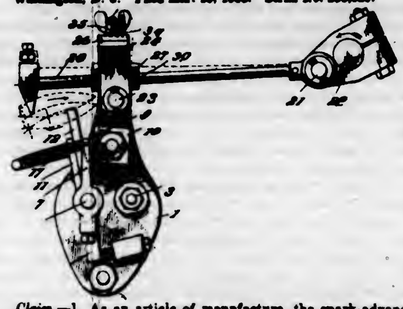
813,925. HAY-STACKER. DANIEL H. SUMMERS, Mercer, Mo. Filed Apr. 21, 1905. Serial No. 256,742.



Claim.—1. In a hay-stacker, the combination of a supporting-frame, arms pivoted to the supporting-frame, a fork carried by said arms, a hoisting-frame, a hoisting-rope connected with the hoisting-frame, connecting means between the hoisting-frame and the arms carrying the fork, a pivoted weighted retarder-bar, a member adjustable longitudinally of said retarder-bar, and a connection between said adjustable member and the fork.

2. In a hay-stacker, the combination of a supporting-frame, arms pivoted to the supporting-frame, a fork carried by said arms, a hoisting-frame, a hoisting-rope connected with the hoisting-frame, connecting means between the hoisting-frame and the arms carrying the fork, a weighted retarder-bar pivoted to the supporting-frame of the stacker and provided longitudinally thereof with a plurality of openings, a pin insertible in a selected one of the openings in the retarder-bar, and a connection between said pin and the fork.

813,926. GAS-ENGINE SPARKER. ANDREW F. TALLHADOR, Washington, D. C. Filed Mar. 16, 1905. Serial No. 250,230.



Claim.—1. As an article of manufacture, the spark-advancer comprising a block adapted to be mounted and rock on a journal and having a longitudinal slideway, a box through which the sparker-actuating rod is adapted to reciprocate, said box confined in said slideway, and means for adjusting said box longitudinally of said slideway and holding the same in the desired adjustment, substantially as described.

2. An explosive-engine spark-advancer comprising a block having a bearing on which the block is adapted to oscillate, a box confined to and movable longitudinally of said block, said box having a bore through which the sparker-actuating rod reciprocates, and a threaded rod and nut for adjusting said box and holding the same in the desired position longitudinally of the block.

3. A spark-advancer comprising a block having a bearing on which the block is adapted to oscillate with a swinging and reciprocating sparker-actuating rod, said block having a longitudinal slideway, a box confined in said slideway to slide longitudinally thereof and having a bore receiving and through which said rod reciprocates, a threaded rod for moving said box in one direction and extending longitudinally of the block, a spring yieldingly pressing said box in the opposite direction, and a nut on said rod for moving the same longitudinally.

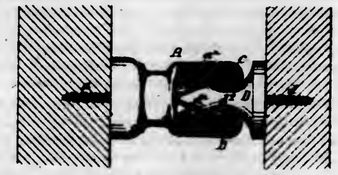
4. A spark-advancer comprising a block having a longitudinal slideway, a plate closing the outer end thereof, a box extending through and longitudinally movable in said slideway and formed with a longitudinal bore therethrough, said box being formed of longitudinal sections removably secured together, a threaded rod confined to said box and extending outwardly through said plate, a spring compressed between said plate and the box, and a nut on the outer end of the rod at the outer face of said plate.

5. In an explosive-engine, in combination, sparking mechanism, a reciprocating and swinging actuating-rod provided with a tripping-dog for actuating said mechanism, means for actuating said rod, and an oscillating block provided with a box in which said rod is confined and through which the same reciprocates, and means for moving said box to move said rod laterally and for locking the same in the desired adjustment.

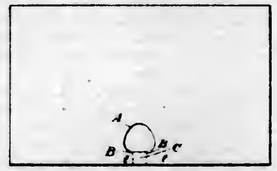
6. In an explosive-engine igniter, a movable electrode, an oscillatory tripped member, a reciprocating engine-operated tripping-rod, a guiding bearing-box surrounding said rod, a rocking block carrying said box, and provisions for shifting said box laterally with respect to the path of movement of the rod.

813,927. DOOR STOP AND RETAINER. DANIEL J. TAYLOR, Philadelphia, Pa., assignor of one-half to Samuel J. Taylor, Philadelphia, Pa. Filed Aug. 17, 1905. Serial No. 274,626.

Claim.—The combination in a door-retainer, of a stop made in a single piece and having a cavity in one end and an annular groove formed in the walls of the cavity, a perforated elastic disk forced into the annular groove and partially closing the cavity, with a headed knob, the head of the knob being greater in diameter than the opening in the disk, but less in diameter than the cavity, so that the disk is free to expand to allow the head of the knob to pass, substantially as described.

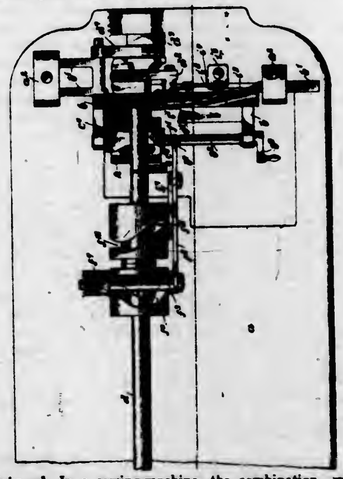


813,928. UNIVERSAL BUSINESS FILING-CARD. MYRON S. TELLER, Kingston, N. Y. Filed Sept. 16, 1905. Serial No. 278,789.



Claim.—A card for use in card-index filing-cases having a hole cut therein for the reception of the locking and holding rod of the case, and lines of perforations extending from the hole to the edge, to permit a piece or part to be readily torn or broken out, permitting the rod to be placed in said hole, and before removal to subserve the purpose of keeping the said piece or part torn out in place thus preserving intact the tabs at the sides of the said lines.

813,929. SEWING-MACHINE. JASPER VANHEYTE, Tiffin, Ohio. Filed Aug. 11, 1905. Serial No. 273,903.



Claim.—1. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a reciprocally-moving frame supporting said spool and having an opening of less length than the latter for the passage of the needle-thread loop in being passed around the spool, the position of said opening being shifted from one end to the other of the spool by the movement of the frame, and means for taking the thread-loop from the needle and passing it around said spool to interlock with the thread carried thereby, said means including a loop-seizing hook and a loop-spreader, the latter being independent of the hook and movable in a path through the said opening in the spool-frame.

2. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a case inclosing said spool, a reciprocally-moving frame supporting said spool and case and having an opening for the passage of the needle-thread loop in being passed around the spool, the position of said opening being shifted from one end to the other of the spool by the movement of the frame, and means for taking the thread-loop from the needle and passing it around said spool to interlock with the thread carried thereby, said means including a loop-seizing hook and a loop-spreader, the latter being independent of the hook and movable in a path through the said opening in the spool-frame.

3. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a frame supporting said spool and having an opening for the passage therethrough of the needle-thread loop, means for imparting movement to said spool and spool-frame in a direction in opposition to each other, and means for passing a needle-thread loop through said opening in the spool-frame and around the spool.

4. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a reciprocally-moving frame supporting said spool and having an opening for the passage therethrough of the needle-thread loop, a reciprocally-moving spool-driver operating in a direction in opposition to the movements of the spool-frame, and means for passing a needle-thread loop around the spool.

5. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a reciprocally-moving frame supporting said spool, a reciprocally-moving driver for imparting movement to the spool in a direction in opposition to the movements of the spool-frame, said driver being connected with the latter to be supported and guided thereby, and means for passing a needle-thread loop around the spool.

6. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a frame supporting said spool provided with an opening for the passage of the needle-thread loop and also having guideways, a reciprocally-moving spool-driver supported and operating in said guideways in the spool-frame, and means for passing a needle-thread around the spool.

7. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a reciprocally-moving frame supporting said spool and having an opening for the passage of the needle-thread loop, a loop-seizing hook operating in a path at one side of the spool-frame, a loop-spreader coöperating with said hook and moving in a path through said opening in the spool-frame to pass a needle-thread loop around the spool, means for operating said hook and loop-spreader, an operating-shaft having a crank or eccentric at that side of the frame opposite the hook, and means operatively connecting said crank or eccentric with the spool-frame.

8. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a reciprocally-moving frame supporting said spool, a reciprocally-moving driver operating said spool in a direction in opposition to the movements of the frame, said driver having a part thereof provided with an opening to receive the spool-supporting portion of the spool-frame, and means for passing a needle-thread loop around the spool.

9. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a support for said spool, a loop-seizing hook operating in a circular path at one side of said spool, a loop-spreader operating in a circular path at substantially right angles to the path of the hook and coöperating with the latter in passing the needle-thread around the spool, the thread engaging or drawing surface of the hook being arranged in a plane parallel with the plane of the path of movement of the hook, and means for operating said hook and spreader, respectively.

10. In a sewing-machine, the combination, with the needle and its operating mechanism, of a reciprocally-moving spool carrying the under thread, a support for said spool, a rotating loop-seizing hook having a relatively thin blade portion of substantially triangular form in a plane at right angles to its axis and provided with a thread-engaging surface at the rear end of said blade arranged in a plane parallel with the plane of the path of movement of the hook and of the needle, the lower edge of said blade being arranged to move, during its passage through the needle-thread loop, in a path in line with or above the lowest limit of movement of the needle-eye for the purpose set forth, and an independent loop-spreader coöperating with said hook in passing the needle-thread around the under thread.

11. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under-thread supply, a rotating shaft carrying a loop-seizing hook, said hook being provided with a thread-engaging surface arranged at right angles to the axis of its operating-shaft whereby the sides of an engaged needle-thread loop will be opened or spread apart in a direction parallel with the plane of the path of movement of the hook, a loop-spreader moving in a path to engage one side of said opened loop and carry the same around the spool, and means for operating said loop-spreader.

12. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under-thread supply, a frame supporting said spool, a circularly-moving loop-seizing hook operating in a path parallel with one side of the spool, a circularly-moving loop-spreader operating in a path around the spool, and means for operating the said hook and spreader, respectively.

13. In a sewing-machine, the combination, with the needle and its operating mechanism, of a reciprocally-moving spool carrying the under thread, a rotating loop-seizing hook having a relatively wide thread-engaging surface arranged at right angles to its axis for entering and opening the needle-thread loop into a triangular shape with the sides spread apart in the direction of movement of the hook, a loop-spreader moving in a path to engage one side of the opened loop and carry the same around the spool, and means for operating the hook and spreader, respectively.

14. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a reciprocally-moving frame supporting said spool and having an opening for the passage of the needle-thread loop, a loop-seizing hook moving in a circular path at one side of said spool, a loop-spreader moving in a circular path around one end of the latter and coöperating with the hook in passing a needle-thread loop around the same, and means for operating the said hook and spreader, respectively.

15. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a support for said spool, a loop-seizing hook and its operating mechanism, a circularly-moving loop-spreader coöperating with said hook in passing the needle-thread around the spool, consisting of a lever having means at its front end for engaging with the thread, a vibrating lever connecting with the rear end of said spreader-lever, and means, coöperating with said vibrating lever, to impart a circular movement to the thread-engaging end of the spreader-lever.

16. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a reciprocally-moving frame supporting said spool and having an opening in its spool-supporting portion, a circularly-moving loop-seizing hook operating in a path at one side of the spool, a loop-spreader, consisting of a lever having a thread-engaging arm, and means for moving said lever through the said opening of the spool-frame and causing its thread-engaging arm to move in a circular path around the end of the spool.

17. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a support for said spool, a loop-seizing hook and its operating mechanism, a loop-spreader for coöperating with said hook in passing a thread-loop around the spool, consisting of a lever having a thread-engaging portion, a vibrating lever pivotally connected with one end of said spreader-lever, and a second vibrating lever having a sliding connection with the spreader-lever and coöperating with the first lever in imparting a circular movement to the thread-engaging end or portion of said spreader-lever.

18. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, means for passing the needle-thread loop around one end of said spool, and a reciprocally-moving loop-pusher operating in a path at one side of the spool for pushing the thread-loop along the same.

19. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a case inclosing said spool, means for passing the needle-thread loop around one end of said spool, and a reciprocally-moving loop-pusher operating in a path at one side of the spool and having a loose connection with the spool-case.

20. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a case inclosing said spool and having a slot therein, means for passing the needle-thread loop around one end of said spool, and a reciprocally-moving loop-pusher operating in a path at one side of the spool with one edge thereof extending into said slot in the spool-case.

21. In a sewing-machine, the combination, with the needle and its operating mechanism, of a reciprocally-moving spool carrying the under thread, a cylindrical case inclosing said spool, means for passing the needle-thread loop around one end of said spool-case, a loop-pusher operating in a path at one side of the spool for pushing the thread-loop along the latter, and means for imparting a reciprocating movement to the loop-pusher in opposition to the movements of the spool.

22. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a case inclosing said spool, a reciprocally-moving frame supporting said spool and case and having an opening for the passage of the needle-thread loop, means for passing the needle-thread loop around one end of said spool-case, and a loop-pusher carried by said spool-frame for pushing the thread-loop along the spool-case.

23. In a sewing-machine, the combination, with the needle and its operating mechanism, of a reciprocally-moving spool carrying the under thread, a case inclosing said spool, means for passing the needle-thread loop around one end of said spool-case, a loop-pusher, consisting of a plate supported with one edge thereof loosely engaging with the spool-case to hold the latter from turning, and provided with a notch in that edge thereof adjacent to the spool-case forming a thread-engaging shoulder, and means for imparting a reciprocating movement to the loop-pusher in opposition to the movements of the spool.

24. In a sewing-machine, the combination, with the needle and its operating mechanism, of a spool carrying the under thread, a support for the spool, a case inclosing said spool provided with an open slot extending lengthwise through the same, means located exteriorly of said case and extending loosely into its slot so as to prevent a turning or rocking movement of the case with its inclosed spool, and means for passing a needle-thread loop around the spool and spool-case to interlock with the under thread.

25. In a sewing-machine, the combination, with the needle and its operating mechanism, of a commercial spool carrying the under thread, a support for said spool, a cylindrical case supported directly upon the periphery of the end flanges of the spool and having a stop projection located on its inner wall at a point distant from the end of the case so as to engage with a spool of less length than the latter and prevent undue endwise movement of the same, and means for passing a needle-thread loop around the spool and spool-case to interlock with the under thread.

26. In a sewing-machine, the combination, with a spool-supporting frame comprising two pins or rods, of a spool carrying the under thread riding directly upon said pins, an open-ended cylindrical case supported upon the periphery of the end flanges of the spool and means independent of the case for holding the same in longitudinal position upon the spool and communicating a reciprocating movement to the case and its inclosed spool.

813,930. **AUTOMATIC KNUCKLE-OPENER.** NORMAN WARNER and GEORGE W. JACOBS, Glenns Ferry, Idaho. Filed Feb. 9, 1905. Renewed Jan. 27, 1906. Serial No. 242,266.

Claim.—1. The combination with a car-coupling mechanism including a pivoted knuckle, of means tending to maintain said knuckle in position to engage a coacting coupling part associated with a companion coupling mechanism, said means including a lever mounted on the pivot-pin of the knuckle and having an arm coacting with the knuckle, substantially as described.

2. The combination with a car-coupling mechanism including a pivoted knuckle, of means for automatically throwing the knuckle when freed in its open position and for yieldingly maintaining said knuckle in said open position, said means including a lever having an engagement with the interlocking arm of the knuckle, substantially as described.

3. The combination with a car-coupling mechanism including a pivoted knuckle, of a lever pivotally mounted outside of the coupling-head, said lever being connected at one end to one arm of the knuckle, and means associated with the lever for automatically shifting the same for throwing the knuckle into open position.

4. The combination with a car-coupling mechanism including a pivoted knuckle, of a pivoted lever having an arm connected to the interlocking arm of the knuckle and a second arm, and tensioning means connected to said second arm.

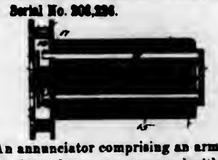
5. The combination with a car-coupling mechanism including a pivoted knuckle, of a pivoted lever having an arm connected to the interlocking arm of the knuckle, and a second arm, and a spring interposed between the second arm and a fixed part.

6. The combination with a buffer-block, a draw-bar head and a knuckle pivoted therein, of a lever mounted upon said head having one arm connected to the knuckle, and a second arm extending at an angle to the first, and a spring interposed between the second arm and the buffer-block.

7. The combination with a car-coupling mechanism including a head and a knuckle pivoted therein, of a lever mounted upon the end of the pivot-pin of the knuckle projecting through the top face of the head, a connection between one arm of the lever and the outer arm of the knuckle, and a spring interposed between a second arm of the lever and a part fixed relatively to the head.

8. The combination with a coupling mechanism including a head and a knuckle pivotally mounted therein, of a lever having a central eye to receive a pivot-pin, an integral arm extending obliquely from the eye and terminating in a vertically-depending part engaging the outer arm of the knuckle, a second integral arm extending from the eye, and tensioning means coacting with the latter arm.

813,931. **ANNUNCIATOR.** JAMES A. WOTTON, Atlanta, Ga. Filed May 16, 1904. Serial No. 208,236.



Claim.—1. An annunciator comprising an armature and an indicator carried thereby and a magnet arranged with its axis parallel with the axis of the armature the said magnet having poles projecting from its coils, the said poles having their axes also parallel with the axis of the armature and capable of operating the armature, the said magnet with its poles being removably mounted so that it may be withdrawn without disturbing the armature of the indicator.

2. An annunciator comprising a supporting-plate, an armature removably mounted upon one side thereof, an indicator carried by the said armature and a magnet removably mounted on the opposite side of the plate from the armature, the poles of the magnet extending to points adjacent to the armature, the removal of the magnet being accomplished without disturbing the armature or the indicator.

3. An annunciator mechanism comprising a supporting-casing, an approximately S-shaped armature mounted therein, an indicator secured to the armature and carried thereby, and a magnet secured to the said casing outside thereof the poles of said magnet projecting through the walls of the casing so as to occupy positions adjacent to the periphery of the armature.

4. An annunciator mechanism comprising a supporting-plate, a stud projecting therefrom, an armature mounted upon the said stud, an indicator carried by the armature, and a magnet mounted upon the plate with its axis approximately at right angles to the plane of the indicator the said magnet being bodily removable therefrom without disturbing the indicator, the poles of said magnet extending to positions adjacent the armature for affecting the same when energized.

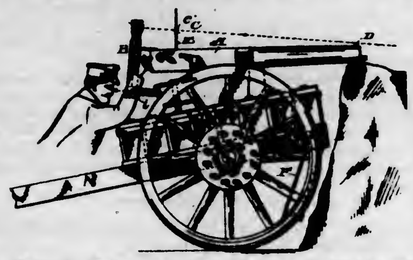
5. An annunciator mechanism comprising separable indicating mechanism and actuating mechanism, the indicating mechanism comprising an armature and an indicator carried thereby and a weight mounted upon the indicator tending to hold it normally in one position, the actuating mechanism comprising a magnet arranged adjacent to the armature, but removable therefrom longitudinally, parallel with its axis without disturbing the armature and indicator, the poles of the magnet being capable of actuating the armature against the action of the weight.

6. An annunciator mechanism comprising an inclosing casing, an apertured face-plate secured thereto, an armature mounted in the casing, an indicator carried by the armature immediately to the rear of the face-plate, the surface of the indicator showing through the apertures in the face-plate, a removable magnet mounted outside the casing on one of the walls thereof, the poles thereof projecting through the casing-wall to points adjacent to the said armature for affecting the same.

7. An annunciator mechanism comprising a supporting-frame or casing, a removable armature mounted therein, a rocking indicator carried by the said armature, a weight upon the indicator for holding the indicator normally in a given position, stops carried by

the frame for engaging the armature and limiting its movement, and a magnet removably mounted upon the outside of the casing, the poles thereof projecting within the casing for moving the indicator against the action of the weight the longitudinal movement of the magnet causing the withdrawal of the poles without disturbing the indicating mechanism.

813,932. SIGHTING OF GUNS FROM COVER. WILLIAM YOULTEN, Westminster, England. Filed Nov. 21, 1902. Serial No. 132,333.



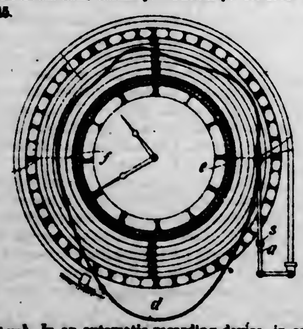
Claim.—1. An instrument for sighting guns from cover, consisting of a tube secured to the gun or cradle, and two substantially vertical tubes, one telescoping within the other, with a reflector in each tube, and an opening for admitting light to said reflector, mechanism for adjusting the height of the upper reflector, and mechanism for canting the instrument to the required inclination, substantially as described.

2. An instrument for sighting guns from cover, comprising a tube detachably connected to the gun or cradle, and provided with graduations, means for tilting said tube through a small angle, a second tube mounted to slide on the first tube and provided with an opening and a reflecting-surface, and a third tube also mounted to slide on the first tube and provided with a reflecting-surface, substantially as described.

3. An instrument for sighting guns from cover, comprising a tube detachably connected to the gun or cradle, and provided with graduations, means for tilting said tube through a small angle, a second tube mounted to slide on the first tube and provided with an opening and a reflecting-surface, a third tube also mounted to slide on the first tube and provided with a reflecting-surface, and a telescope carried by said third tube, substantially as described.

4. An instrument for sighting guns from cover, comprising a tube attached to the gun and provided with graduations for range, means for tilting said tube through a small angle, a second tube mounted on the first and provided with a prism for refracting light, means for moving said second tube longitudinally on the first, a third tube also mounted to slide on the first tube and provided with a prism therein, and a telescope mounted in rear of said second prism, substantially as and for the purposes described.

813,933. AUTOMATIC RECORDING DEVICE. ADOLF ABRAHAM, Neuhaus-on-the-Oste, Germany. Filed Sept. 20, 1905. Serial No. 279,345.



Claim.—1. In an automatic recording device, in combination an indicator, a clockwork, a movable surface and a chain moving together with the surface, means operated by the indicator to guide the chain on the surface.

2. In an automatic recording device, in combination an indicator, a clockwork a movable surface and a chain moving together with the surface, a lever operated by the indicator and provided with a guiding-eye to guide the chain on the surface.

3. In an automatic recording device, in combination an indicator, a clockwork, a movable surface and a chain moving together with the surface, a magnet to hold the chain to the surface, means operated by the indicator to guide the chain on the surface.

4. In an automatic recording device, in combination an indicator, a clockwork a movable disk and a chain moving together with the disk, the disk being provided with a scale, a magnet to hold the chain to the disk and a lever operated by the indicator to guide the chain on the disk.

5. In an automatic recording device, the combination with a suitable moving chart, a flexible metallic marker coöperating with the chart and magnetically held thereto, means to move the marker in accordance with the indications to be recorded.

6. In an automatic recording device, the combination with a suitable moving chart, an endless metallic chain coöperating with the chart to mark on a portion thereof the indications desired, means to position said chain on the chart in accordance with the indications to be recorded and means to create a magnetic field from the positioning means along the path of the chart for a determined distance, whereby said chain is held to the chart in the line recording the indications over a definite period of time and is automatically released from the chart after having passed said field.

7. In an automatic recording device, the combination with a chart, a driving mechanism therefor, means to produce a magnetic field extending over a portion of its path, an endless chain held to the chart by said field and means at the beginning of the field to guide the chain relatively to the chart in accordance with the indications to be recorded.

8. In an automatic recording device, a disk, a clockwork to rotate the same, said disk having concentric rulings to indicate different values and circumferential markings to indicate time, means to produce a magnetic field over the upper part of said disk between the determined time-markings, an endless chain held to said disk by said field, and an indicator moved in accordance with the indications to be recorded, to position said chain between the concentric rulings as it enters the magnetic field.

9. In an automatic recording device, the combination with a chart having parallel rulings thereon in the direction of travel of the chart and time-indicators at its edge, means to drive the chart, means to produce a magnetic field extending over a portion of its surface, an endless chain held to the chart by said magnetic field and an indicator to move the chain relatively to the rulings and in accordance with the indications to be recorded.

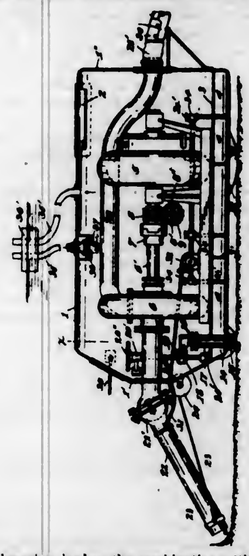
813,934. PROTECTIVE COVER FOR PNEUMATIC TIRES. JOSEF ALBERS, Aix-la-Chapelle, Germany. Filed Apr. 7, 1905. Serial No. 254,415.

Claim.—Improved protective cover for pneumatic tires of cycles of all kinds, composed of one single, continuous piece of leather adapted to inclose the entire outer surface of the pneumatic tire, including the reinforcements in the wheel-rim and vulcanized with the said tire and secured in the wheel-rim, reinforced internally by a lining of crescent shape in cross-section, secured to the outer cover by double-pointed internally-clenched rivets, presenting outwardly heavy heads on the thread surface, substantially as described.

813,935. SUBMARINE DREDGE. THADDEUS AVERY, Jr., Joliet, Ill. Filed Aug. 1, 1904. Serial No. 219,594.

Claim.—1. In a submarine dredge, the combination with a water-tight vessel, of an excavating-pump and means to drive the same, a suction-pipe provided with a swinging end portion, means to control the movement of said end portion, and a discharge-pipe.

2. In a submarine dredge, the combination with a water-tight vessel, of an excavating-pump located within the vessel and provided with a suction-pipe and a discharge-pipe, both extending from within the vessel to outside of the same, means located within the vessel to drive said pump, a third pipe extending from within the vessel to a point adjacent the outer end of said inlet-pipe, means located within the vessel for discharging water through said last-named pipe.



3. In a submarine dredge, the combination with a water-tight vessel, an excavating-pump having suction and discharge pipes and means to drive said pump, of a sluice-box connected to said discharge-pipe and a removable cover for said box.

4. In a submarine dredge, the combination with a water-tight vessel, an excavating-pump having suction and discharge pipes, and means carried within the vessel to drive said pump, of a sluice-box carried by the vessel exteriorly thereof and connected to the discharge-pipe.

5. In a submarine dredge, the combination with a water-tight vessel and the dredging device, of supporting and traction wheels for the vessel, means to rotate the axle of one pair of wheels and means to rotate the other pair of wheels to propel the vessel.

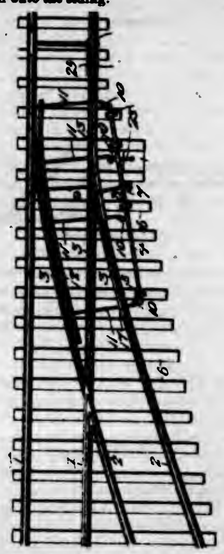
813,936. SWITCH. WILLIAM S. BAILEY, Spring Hope, N. C. Filed June 19, 1905. Serial No. 266,266.

Claim.—1. The combination with the track-rails and the movable switch-points connected therewith, of a rock-shaft journaled adjacent the track and connected with said switch-points, operating-rods connected with said rock-shaft, and means to depress said rods to hold the switch in set position during the passage of the car thereon.

2. The combination with the track-rails and the movable switch-points connected therewith, of a rock-shaft journaled adjacent the track and connected with the switch-points, operating-rods connected with the rock-shaft, an operating-plate overlying said rods and adapted to depress said rods in operation, and a holding-plate overlying said rods and adapted to operate the rod in vertical movement.

3. The combination with the track-rails and movable switch-points connected therewith, a rock-shaft journaled adjacent the rails and connected with said points, means for operating the shaft in one direction, operating-rods connected with the shaft for its reverse operation, means for initially operating said rods, and means for holding said rod when operated, said latter means being controlled by the movement of the car.

4. The combination with a main track, a siding, and switch-points coöperating therewith, of a rock-shaft journaled adjacent the track-rails and connected with the switch-points, means connected with the rock-shaft for automatically holding said switch-points to open the main track, means operated by the advancing car to move said rock-shaft to open the siding, and means operated by the advancing car to hold said rock-shaft in operative position during the passage of the car onto the siding.



5. The combination with a main track, a siding, and switch-points coöperating therewith, of a rock-shaft journaled adjacent the track-rails and connected with the switch-points, means connected with the rock-shaft for automatically holding said switch-points to open the main track, means operated by the advancing car to move said rock-shaft to open the siding, and means operated by the advancing car to hold said rock-shaft in operative position during the passage of the car onto the siding, all of said parts being located below the tread of the rails.

813,937. CYCLE-LOCK. KARL BALLOD, Riga, Russia. Filed Nov. 18, 1904. Serial No. 233,365.

Claim.—1. A cycle-lock comprising two clamps adapted to be attached to the bars of the frame of a cycle, a spring-actuated bolt pivoted on one of said clamps, a casing containing a lock carried by the other clamp and a swinging attachment to said casing, said lock being provided with spring-actuated means for holding said bolt when swung into contact therewith, and with means for holding said lock open after it has been opened by a key, substantially as described.

2. A cycle-lock comprising two clamps adapted to be secured to the bars of the frame of a cycle, a swinging bolt pivotally attached to one of said clamps, a spring tending to swing said bolt out of contact with the cycle-wheel, a casing provided with a lock carried by the other clamp, said casing being provided with a swinging extension, and spring-actuated means in said lock for automatically engaging and locking said bolt when the latter is swung up into contact therewith, and spring-actuated means for holding said lock open after it has been opened by a key, substantially as described.

3. A cycle-lock comprising two clamps adapted to be secured to the bars of the frame of a cycle, a slotted bolt pivotally connected to one of said clamps, a spring engaging said bolt and normally tending to hold it out of contact with the cycle-wheel, a casing, provided with a swinging extension, carried by the other clamp, a lock in said casing, a spring-actuated sliding piece provided with a projection, the end of said sliding piece being adapted to engage the slot in said bolt and a spring-actuated pivoted piece provided with a projection adapted to engage the projection on said sliding piece and hold the lock open after it has been opened by a key, substantially as described.

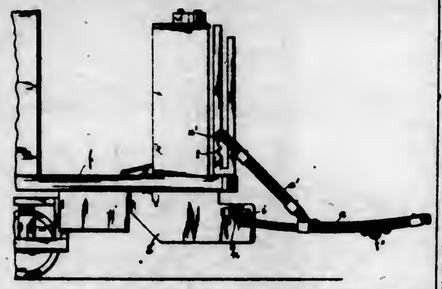
813,938. CAR-FENDER. CHARLES BAUER, New York, N. Y. Filed Oct. 12, 1903. Serial No. 176,462.

to said lever and extending upward through said bench, plate and

the perforate chamber so as to leave a passage between the two caps

a gasket interposed between the body and head flanges and said

813,938. CAR-FENDER. CHARLES BAUER, New York, N. Y. Filed Oct. 12, 1905. Serial No. 282,402.

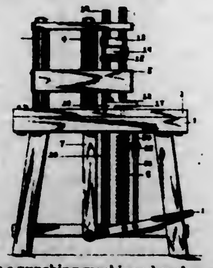


Claim.—1. A car-fender which normally is locked in a raised position from the track and in case of an accident is dropped onto the same, comprising two frames formed of U-shaped bars covered with nettings, one of said frames forming the fender proper and being removably supported from the car and the other forming the bumper-guard being hinged to the first to swing vertically therein, the rear end of said bumper-guard being vertically guided, a catch or lock mechanism underneath the platform of the car to normally lock the fender proper in raised position from the track, a releasing mechanism on the platform to allow the release of the catch mechanism at the desired moment, substantially and for the purpose as specified.

2. A car-fender which normally is locked in a raised position from the track and in case of accident is dropped onto the same, comprising two frames formed of U-shaped bars covered with nettings, one of said frames forming the fender proper and having its ends bent inward to form journals, castings fixed to the under surface of the car, recesses in said castings, said recesses being adapted to bear the said journals and allowing the latter to be easily slipped into said bearings and removed therefrom, means to prevent an involuntary disengagement of the journals from the bearings, the other frame forming the bumper-guard and being hinged to the fender proper to swing thereon vertically, a guide for said bumper-guard, said guide extending upward from the platform, a catch or lock mechanism underneath the platform to lock the fender proper in a raised position from the track and means for releasing the said lock mechanism, substantially and for the purpose as specified.

3. The combination with a car-fender which normally is locked in a raised position from the track and in case of accident is dropped onto the same, of a guide and catch for the bumper-guard, comprising two upright rods centrally arranged behind and at a distance from each other upon the platform, the rear end of the bumper-guard being adapted to engage between the said guide-rods and to slide therein when the fender proper is turned from one position into the other, notches at the lower end of the rear rod, said notches being adapted to engage and lock the bumper-guard when the main fender is dropped onto the track, and hold the latter in close contact therewith, substantially and for the purpose as specified.

813,939. PUNCHING-MACHINE. JOHN A. BELL, Lathrop, Cal. Filed Nov. 20, 1905. Serial No. 288,131.



Claim.—1. In a punching-machine a bench, a plate arranged on the top of said bench, two upwardly-extending standards on said plate, two outwardly-extending arms on said standards, a foot-lever secured to the under side of said bench, a spring located between said lever and the under side of said bench, a rod pivotally secured to said lever and extending upward through said bench, plate and arms, a punch-rod bearing in said arms and means for connecting said rods, as specified.

2. In a punching-machine the combination of a bench, an iron plate arranged on the top thereof and provided with a punch-die, two standards extending upward from said plate, two arms extending at right angles to said standards, a foot-lever secured beneath said bench, a spring located between said lever and the under side of said bench, a rod pivotally secured to said lever and extending upward through said bench, plate and arms, two outwardly-extending lugs forming component parts of said rod between said arms, a punch-rod bearing in said arms and adapted to coact with said die, and a lug forming a component part of said punch-rod and extending between said first-named lugs.

3. In a punching-machine the combination of a punching device, a spacer, consisting of a table, a slotted plate arranged on the top thereof, a slide-plate arranged in said slot and provided with notches at given distances apart, a slot in said table opening into said first-named slot, a lever fulcrumed to the under side of said table, a foot-lever secured to said table, a link connecting said foot-lever to said first-named lever, a spring located between said foot-lever and the under side of said table, a catch pivotally secured to said first-named lever and extending through said last-named slot into said first-named slot, and engaging with said notches, and a spring secured to said first-named lever and bearing against said catch, as set forth.

813,940. LAMP FOR BURNING OIL, &c. GEORGE BENTOTE, Acton, England. Filed Dec. 16, 1905. Serial No. 292,065.

Claim.—1. In a lamp, a reservoir, a perforate chamber fitting within the reservoir and adapted to be filled with absorbent material, a conical centrally-perforated cap closing the top of the perforate chamber and a centrally-perforated conical cap or burner-cone closing the top of the reservoir and inclosing the cap of the perforate chamber but formed of larger dimensions than the latter cap so as to leave a passage between the two caps substantially as herein shown and described and for the purpose stated.

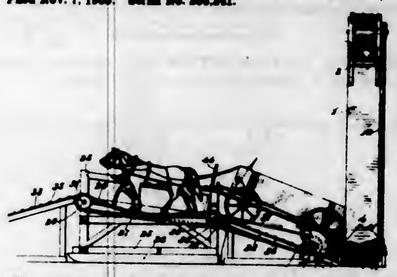
2. In a lamp, a reservoir, a perforate chamber removably fitting within the reservoir and adapted to be filled with absorbent material, a conical centrally-perforated cap closing the top of the perforate chamber, a centrally-perforated conical cap or burner-cone closing the top of the reservoir and inclosing the cap of the perforate chamber but formed of larger dimensions than the latter cap so as to leave a passage between the two caps and means for varying the elevation of the burner-cone substantially as herein shown and described and for the purpose stated.

3. In a lamp, a reservoir, a perforate chamber removably fitting within the reservoir and adapted to be filled with absorbent material, a centrally-perforated cap closing the top of the perforate chamber, a wick-tube fitted within said perforation and adapted to hold a wick, a conical cap or burner-cone closing the top of the reservoir and inclosing the cap of the perforate chamber and centrally perforated with a hole of larger diameter than the wick-tube said cap or cone being formed of larger dimensions than the cap of the perforate chamber so as to leave a passage between the two caps and means for varying the elevation of the burner-cone substantially as herein shown and described and for the purpose stated.

4. In a lamp, a reservoir, a perforate chamber removably fitting within the reservoir and adapted to be filled with absorbent material, a centrally-perforated cap closing the top of the perforate chamber and adapted to be fitted with a wick, a conical cap or burner-cone closing the top of the reservoir and inclosing the cap of the perforate chamber and centrally perforated and formed of larger dimensions than the cap of the perforate chamber so as to leave a passage between the two caps, a pin upon the reservoir and an inclined slot in the burner-cap or cone engaging said pin substantially as herein shown and described and for the purpose stated.

5. In a lamp, a reservoir, a perforate chamber removably fitted within the reservoir and adapted to be filled with absorbent material, a centrally-perforated cap closing the top of the perforate chamber, a wick-tube adjustably fitted within said perforation and adapted to hold a wick, a conical cap or burner-cone closing the top of the reservoir and inclosing the cap of the perforate chamber and centrally perforated with a hole of larger diameter than the wick-tube said cap or cone being formed of larger dimensions than the cap of the perforate chamber so as to leave a passage between the two caps and means for varying the elevation of the burner-cone substantially as herein shown and described and for the purpose stated.

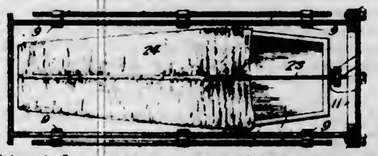
813,941. ELEVATOR. DANIEL BLACKSTONE, Shelbyville, Ill. Filed Nov. 7, 1905. Serial No. 286,941.



Claim.—1. In an elevating apparatus, the combination of a treadmill having inclined approaching and descending platforms leading thereto and extending therefrom, said mill comprising an endless belt having a driving-shaft provided with a sprocket-gear, an elevator disposed in rear and at one side of the inclined approach and provided with a drive-shaft carrying a pinion and a beveled gear, an intermediate power-shaft provided with a beveled gear meshing with the beveled gear on the elevator-shaft and carrying a sprocket-wheel, a sprocket-chain connecting said sprocket-wheel with the sprocket-gear on the treadmill-shaft, a conveyer-frame pivotally mounted to swing upon the elevator in a vertical plane and adapted to be lowered across the lower end of the inclined approach, said conveyer-frame having a drive-shaft and a conveyer actuated thereby, said shaft carrying at one end a sprocket-wheel, a chain connecting said sprocket-wheel with the sprocket-wheel on the elevator-shaft, and a brake for controlling the treadmill.

2. In an elevating apparatus, the combination of a treadmill, inclined passages leading to and from the mill, said mill comprising an endless belt mounted upon shafts, one of said shafts being provided at one end with a sprocket-wheel and at its opposite end with a friction brake-wheel, a pivotally-mounted lever for engaging said brake-wheel and provided with means for locking it in adjusted position, an elevator disposed at the rear and at one side of the inclined approach and having a drive-shaft provided with a beveled pinion and a sprocket-wheel, a power-shaft having a beveled gear meshing with said pinion, and a sprocket-wheel, a sprocket-chain connecting said sprocket-wheel with the sprocket-wheel on the treadmill-shaft, brackets on the elevator-frame, a conveyer having a drive-shaft journaled in said brackets and pivotally connecting the conveyer thereto; whereby said conveyer is adapted to be elevated and lowered to extend across the bottom of the inclined approach, means for securing the conveyer in raised position, a sprocket-wheel on the conveyer-shaft, and a chain connecting said sprocket-wheel with the sprocket-wheel on the elevator-shaft.

813,942. BURIAL-CASKET. JACOB BLAKE, Bedford, Iowa. Filed Nov. 7, 1905. Serial No. 286,936.



Claim.—1. In a burial device, a receptacle having a transparent panel, a rod disposed longitudinally thereof above said panel, and a curtain longitudinally adjustable on said rod to expose or cover the panel.

2. In a burial apparatus, an exterior coffin box or casing comprising a body provided at one end with a strengthening-flange depending to form a supporting-leg and having its opposite end open and formed with a surrounding flange and a hood projecting beyond the upper portion of the flange, said flange having a depending portion constituting a complementary leg, a head for closing the said open end of the casing provided with an inwardly-extending flange, a gasket interposed between the body and head flanges and said body-flange and marginal portion of the head outside the flange thereon, and bolts passing through the body-flange, gasket and marginal portion of the head and tightly joining said parts, the hood lapping over the upper portion of the joint, substantially as described.

3. In a burial apparatus, a casing, a coffin adapted to be inserted longitudinally therein, a rod permanently fastened at one end within the casing and having its opposite end free, perforated members on the coffin adapted to engage and slide along the rod upon the insertion of the coffin, to connect the coffin and casing together, and means for fixing the free end of the rod to the casing.

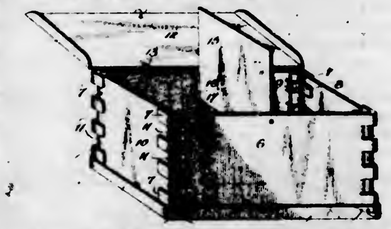
4. In a burial apparatus, a casing, a coffin adapted to be inserted longitudinally therein, interengaging devices upon the casing and coffin brought into engagement when the latter is inserted to hold the same stationary within the casing, and means for maintaining the parts in connected relation.

5. In a burial apparatus, a casing having an opening at one end thereof, a rod fixed at one end within the casing, a coffin adapted to be inserted longitudinally into the casing and provided with members to engage and interlock with said rod as the casket is inserted, a fastening device upon the casing to engage and hold the free end of the rod from movement, and a closure for the casket-opening.

813,943. MACHINE FOR CUTTING SUGAR-CANE. JAMES A. BOLDEN, Gray, La. Filed July 21, 1905. Serial No. 270,703.

Claim.—An apparatus for cutting cane, comprising a truck, an arm projecting from said truck, vertically-adjustable plates mounted in suitable guideways, knives fastened to said plates and disposed in horizontal planes with inclined cutting edges extending toward each other, a lever secured to one of said plates and fulcrumed over said projecting arm, means for holding the free end of said lever in different positions, and a bar secured to one end of the other of said plates and fastened to said lever, whereby as the lever is tilted, said plates may be raised or lowered, as set forth

813,944. SHIPPING-CRATE. JOHN H. DUBAR, Denver, Colo. Filed July 31, 1905. Serial No. 271,963.



Claim.—1. A collapsible shipping-crate comprising a bottom section having side and end flanges, side sections mounted upon the bottom section, parallel series of fingers integral with each end of each side section and extending at right angles therefrom, and end sections having right-angle extensions at their ends adapted to be seated between the series of fingers and the side sections.

2. A collapsible crate comprising a bottom section, side sections mounted thereon, angular fingers at each end of and integral with each side section, said fingers being disposed in parallel rows, the end sections having end flanges adapted to be inserted between the rows of fingers at each end of the side sections.

813,945. DRESS-PLACKET FASTENER. GEORGE BURROWS, Liverpool, England. Filed July 14, 1904. Serial No. 216,619.

Claim.—1. In a device of the character described, the combination of a primary blade, a stirrup having an opening secured to said blade, said stirrup provided with parallel, right-angled extensions

material to said single saw and past said single saw to said plurality of saws.

tached thereto, the ends B, C, of the wire being twisted tightly about the lace proper and the body of the said wire being extended along

partment, and a delivery-pipe communicating with the upper compartment.

Claim.—1. In a device of the character described, the combination of a primary blade, a stirrup having an opening secured to said blade, said stirrup provided with parallel, right-angled extensions and a spring, an auxiliary blade provided with a stirrup pivotally mounted upon said extensions, said auxiliary stirrup provided with a finger, and said finger normally in engagement with said spring.

2. In a device of the character described, the combination of a flexible, primary blade, a stirrup having a rectangular opening secured to said blade, an angular spring secured upon said stirrup and partly closing and extending into said opening, said stirrup provided with parallel, right-angled extensions, an auxiliary flexible blade provided with a stirrup pivotally mounted upon said parallel extensions, said auxiliary blade provided with a finger, said finger extending into the rectangular opening of the stirrup secured to the primary blade and normally in engagement with the spring for controlling movement of the blade.

3. A device of the character described, comprising a primary and an auxiliary blade, said primary blade provided with a stirrup at one end, said stirrup having an opening formed therein, parallel, integral extensions formed upon said stirrup, a spring secured upon one side of said stirrup and projecting into the opening formed therein, a stirrup secured to said auxiliary blade near one end, and a finger formed upon said stirrup and normally engaging the portion of the spring projecting into the opening of the stirrup carried by the primary blade.

4. A device of the character described, comprising a primary and an auxiliary blade, a stirrup having a rectangular opening secured to said primary blade at its lower end, an angular spring secured near one end of said stirrup and projecting into said opening, said stirrup provided with parallel extensions projecting at right angles thereto, the auxiliary blade journaled upon said parallel extensions, a stirrup secured to the lower end of said auxiliary blade, a finger secured to said stirrup adapted to engage the inner face of said spring and slide longitudinally over a portion of the inner face of the same, when lateral movement is imparted to one of said blades.

5. In a device of the character described, the combination of a primary blade, a stirrup provided with an opening carried by said blade, said stirrup provided with extensions, a spring carried by said stirrup and extending into the opening thereof, an auxiliary blade provided with a stirrup, pivotally mounted upon said extensions, and a finger formed upon said stirrup carried by the auxiliary blade, the finger adapted to engage said spring.

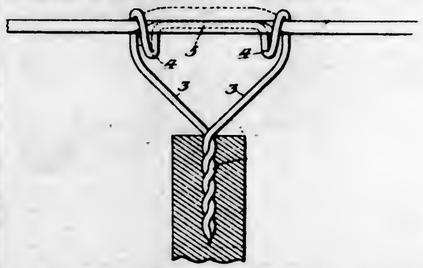
813,946. **SHINGLE-TRIMMING MACHINE.** JOHN D. CALDWELL and IVAN BURROWS, Seattle, Wash. Filed Sept. 14, 1904. Serial No. 224,309.

Claim.—1. In a machine of the class described, the combination with the framework, of a plurality of saws mounted upon an arbor, feed and pressure rolls for said saws, a single saw mounted upon another arbor and positioned outside of the plane of the outermost of the aforesaid saws, track-rods mounted on said frame and extending from in front of to the rear of said single saw and a carriage mounted on said track-rods and adapted to convey the shingles being operated upon to first-mentioned plurality of saws or to the last-named saw, substantially as described.

2. In a machine of the class described, the combination with a framework, an arbor journaled therein, a single saw carried on said arbor and located outside the framework, of another arbor mounted on the framework, a plurality of saws mounted on said last-named arbor and a carriage mounted on the framework and adapted to feed material to said single saw and past said single saw to said plurality of saws.

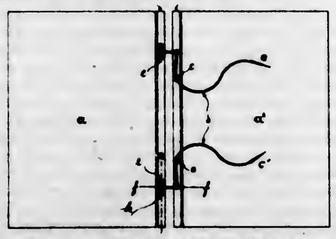
3. In a machine of the class described, the combination with the framework, a plurality of saws carried by an arbor, said arbor, a carriage reciprocally mounted upon said frame, of a table positioned upon the opposite end of the frame to the carriage, said table having an opening therein through which the waste products will fall, substantially as described.

813,947. **PROP FOR CLOTHES-LINES.** ABSHERAN J. CAMPBELL, Berwyn, Pa. Filed July 13, 1904. Serial No. 216,265.



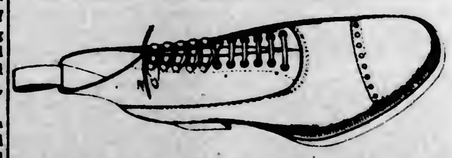
Claim.—A clothes-line prop comprising a head constructed of a single length of wire having its ends twisted together in spiral form, and provided with a sharp-pointed end, a pair of arms diverging upwardly from said spiral twist and provided respectively with spiral hooks having inner upturned portions, said hooks being spaced in a direction parallel with the longitudinal axis of a clothes-line, and a cross-bar connecting the terminals of the upturned portions of the hooks, and the clothes-line serving to contact with the cross-bar and arranged parallel therewith when said line is engaged by said hooks, substantially as specified.

813,948. **TEMPORARY BINDER.** JENS H. CHRISTENSEN, Chicago, Ill. Filed Apr. 10, 1905. Serial No. 254,871.



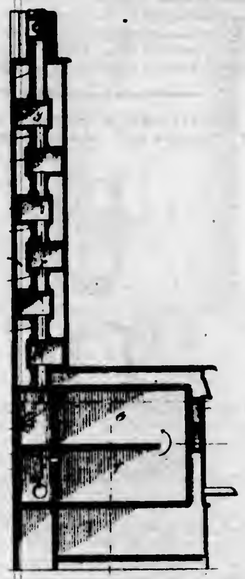
Claim.—A temporary binder consisting of two covers, a binding-strip flexibly connected to the rear edge of each cover and having a number of openings, fasteners secured on one strip, cords adapted to pass through said openings and connect the strips, each cord having at one end a metal retaining-tip, a portion of each of said tips being formed in cross-section into a half-tubular shape and the other portion of each tip being formed into full tubular shape and adapted to engage one end of the cords the other ends of the cords being adapted to engage said fasteners, substantially as described.

813,949. **SHOE-LACE.** WILLIAM H. CLING, Charleston, S. C. Filed Mar. 10, 1904. Serial No. 197,695.



Claim.—The improved shoe-lace, comprising the flexible lace proper of ordinary construction, and the flexible wire which is attached thereto, the ends B, C, of the wire being twisted tightly about the lace proper and the body of the said wire being extended along such lace between such points of attachment, and the ends of the lace proper being left free, substantially as described.

813,950. **COMBINED RANGE, &c., AND HEATING APPARATUS.** WARREN H. CONOVER, Freehold, N. J., assignor of one-half to James Parker, Jersey City, N. J. Filed May 17, 1902. Serial No. 107,830.



Claim.—1. In a water-heating appliance, for hot-water heating systems, in combination, a heating-chamber, a plurality of water-heating compartments arranged one above the other within said heating-chamber, each compartment being arranged on the opposite side of said heating-chamber from the adjacent compartment to provide a sinuous passage through said chamber between said compartments, and a single pipe connecting each compartment with the adjacent compartment, the pipes connecting the several compartments being arranged substantially in alinement, whereby a straight and single passage is provided through said heating-compartments.

2. In a water-heating appliance for hot-water heating systems, in combination, a fire-box, a heating-chamber communicating with said fire-box, a water-heating device having a plurality of water-heating compartments arranged one above the other within said heating-chamber, each compartment being arranged on the opposite side of said heating-chamber from the adjacent compartment to provide a sinuous passage through said heating-chamber between said compartments, a return-pipe of a hot-water heating system communicating with the bottom compartment, a delivery-pipe of a hot-water heating system communicating with the upper compartment, and a single pipe connecting each compartment with the adjacent compartment, the pipes connecting the several compartments being arranged substantially in alinement, whereby a straight and single passage is provided through said compartments.

3. The combination with a stove, of a water-heating chamber arranged at the rear of said stove and communicating with the fire-box thereof, said heating-chamber being in communication with the chimney of the stove, a plurality of water-heating compartments arranged one above the other within said chamber, each compartment being arranged on the opposite side of said chamber from the adjacent compartment to provide a sinuous passage through said chamber between said compartments, a single pipe connecting each compartment to the adjacent compartment, the pipes connecting the several compartments being arranged substantially in alinement, whereby a straight and single passage is provided through said heating-compartments, a return-pipe communicating with the bottom compartment, and a delivery-pipe communicating with the upper compartment.

4. The combination with a stove, of a water-receptacle arranged around the fire-box thereof, a return-pipe connected to said receptacle, a heating-chamber arranged at the rear of said stove and communicating with said fire-box and also the chimney of the stove, a plurality of water-heating compartments arranged one above the other within said heating-chamber, each compartment being arranged on the opposite side of said heating-chamber from the adjacent compartment to provide a sinuous passage through said chamber between said compartments, a single pipe connecting each compartment to the adjacent compartment, the pipes connecting the several compartments being arranged substantially in alinement, whereby a straight and single passage is provided through said heating-compartments, and a delivery-pipe connected to the upper compartment, the lower compartment being connected to said receptacle.

5. The combination of a range, stove, furnace, &c., and a water-heating apparatus consisting of a chamber having a lower section provided with an inlet and an upper section provided with an outlet, said sections communicating with each other at the end opposite the outlet and inlet and communicating with corresponding upper and lower sections of a second heating-chamber at the opposite side of the fire-box, to provide a tortuous passage therethrough, substantially as set forth.

6. The combination, with a range, stove, furnace, &c., of a water-heating apparatus having, at opposite sides of the fire-box of said stove, &c., lateral subdivided chambers, each of the thus formed upper and lower compartments of said chambers communicating at one end with each other, and a second compartment or sub divided chamber arranged at the back of said fire-box with its compartments communicating with the upper and lower compartments of said lateral chambers, at the opposite ends of the last named, and having an outlet and an inlet passage, respectively, substantially as set forth.

7. The combination of a stove, range, furnace, &c., a water-heating apparatus having opposite chambers provided with upper and lower sections communicating with each other at one end and opening at their opposite ends into common corresponding upper and lower chambers or compartments, separated one from the other, said lower chamber having a delivery-opening and said upper chamber communicating with a boiler, comprising a series of sections or compartments connected by means which form alining passages therethrough, arranged within said heating-chambers, substantially as set forth.

813,951. **TUFTED PILE FABRIC.** THOMAS COOPER, Kidderminster, England. Filed June 19, 1905. Serial No. 266,096.

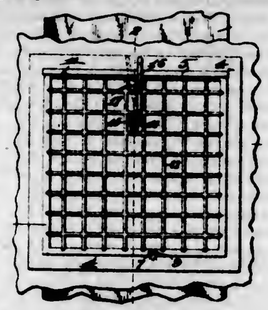
Claim.—A tufted pile fabric of three-shot weft, the tufts being doubled on the lower shots of weft, the warps of which fabric are in series of four threads, one warp of each series of four threads being straight or approximately straight and being arranged under the top shot of weft, a pair of straight warps being situated under the middle shot of weft and a fourth thread or binding-warp passing under the lower shots of weft and over the upper shots of weft and between the last-named pair of straight warps substantially as set forth and shown.

813,952. **WALL-REGISTER.** EDWARD P. COMBY, St. Louis, Mo., assignor to Look-Well Wall Register Company, St. Louis, Mo., a Corporation of Missouri. Filed June 15, 1905. Serial No. 265,413.

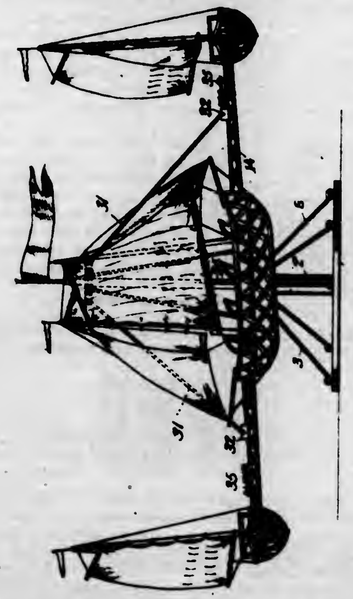
Claim.—1. A wall-register, comprising in combination a frame, a grille-frame adapted to be removably positioned in said frame, a damper hinged to the upper end of said grille-frame, an operating-handle secured to said damper by a connection which permits said handle to be swung both vertically and laterally, said grille-frame being provided with a pin projecting horizontally and parallel with said damper, and said handle being provided with offset portions adapted to be engaged over said pin to retain the damper in its closed position or under said pin to retain the damper in its open positions.

2. A wall-register, comprising in combination a frame, a grille-frame adapted to be removably positioned in said frame, a damper hinged to the upper end of the grille-frame, an operating-handle se-

cured to said damper by a connection which permits said handle to be swung both vertically and laterally and which handle projects through the grille-frame and is so formed as to be engaged upon the grille-frame to retain the damper in either open or closed positions; substantially as specified.



813,953. AMUSEMENT DEVICE. ALFRED DALFEN, Brooklyn, N. Y. Filed Sept. 6, 1905. Serial No. 277,202.



Claim.—1. An amusement device having a support, a hub mounted for a rotary movement on said support, said hub being formed with a plurality of pairs of shoulders arranged in different planes, and a plurality of pairs of supporting-beams resting against said shoulders and crossing each other at suitable angles.

2. An amusement device having a support, a hub mounted for a rotary movement on said support, said hub being formed with a plurality of pairs of shoulders arranged in different planes, and a plurality of pairs of supporting-beams resting against said shoulders and crossing each other at suitable angles, the ends of all of said beams terminating in the same plane.

3. An amusement device comprising a supporting member, a hub mounted for a rotary movement on said supporting member said hub having an irregular bore in the upper portion thereof, a plurality of rollers journaled upon the supporting member and adapted to engage the walls of the irregular bore for imparting a wabbling motion to the hub, a framework connected with the hub, and means for rotating the framework.

4. An amusement device comprising a supporting member, a hub mounted upon the supporting member and having an irregular bore in the upper portion thereof, a plurality of rollers journaled upon the hub and being adapted to contact with the walls of the irregular bore for imparting a wabbling motion to the hub, a plurality of pairs of shoulders formed upon the hub in different planes, a plurality of pairs of supporting-beams resting against the shoulders and having their outer ends arranged in the same plane, a plurality of boats connected with the supporting-beams, a vertical shaft extending through the supporting member, means for rotating the vertical shaft, a plurality of draw-rods connected with the vertical shaft, a plurality of sliding members upon the supporting-beam, said sliding members being connected with the draw-rods, and a plurality of buffing devices upon the supporting-beams, said buffing devices being adapted to coöperate with the sliding member to limit the tilting or wabbling movement of the frame formed by the supporting-beams.

813,954. POULTRY DRINKING-FOUNTAIN. THOMAS A. DAVIS, Findlay, Ill. Filed July 6, 1905. Serial No. 268,573.

Claim.—1. A poultry drinking-fountain, consisting of a pan, having supporting means in the bottom, substantially as stated; a receptacle-barrel having a horizontal flange provided with drinking-openings resting on said pan; and a reservoir or fountain, closed at the top and open at the bottom, arranged in said barrel and resting upon said supporting means in the pan.

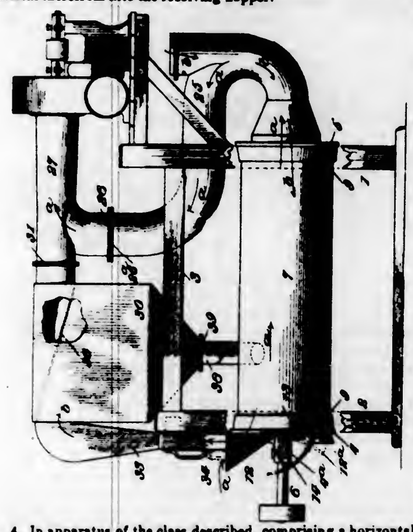
2. A poultry drinking-fountain consisting of a pan having a bar and studs in its bottom, a receptacle-barrel having a horizontal flange provided with drinking-openings resting on the said studs in the said pan, and a reservoir or fountain closed at the top and open at the bottom, having its open bottom arranged in the said barrel and resting on the said bar on the bottom of the pan, the said bar being lower than the studs upon which the receptacle is supported.

813,955. COFFEE COOLER AND STONER. WILLIAM DEAN, Memphis, Tenn. Filed Mar. 28, 1905. Serial No. 252,549.

Claim.—1. An apparatus of the class described, comprising a substantially imperforate revolving receptacle provided internally with agitators, means for revolving the receptacle, a blower, pipes connecting both ends of the receptacle with the blower, and valves in the pipes, whereby the draft may be directed longitudinally through the receptacle in line with the feeding of the material to cool the same, or the direction of the draft reversed to discharge the material from the receptacle and separate foreign matter therefrom.

2. An apparatus of the class described comprising a substantially imperforate revolving receptacle, having stationary heads to close the ends thereof, each head having an opening, a pipe communicating with the opening in one of the heads, valves in the pipe, a blower connected to the pipe, a hopper connected to the pipe, a duct connecting the hopper and the opening in the second-mentioned head, whereby the draft created by the blower may be passed through the revolving receptacle in either direction, and means for revolving the receptacle.

3. An apparatus of the class described, comprising a substantially closed, revolving receptacle mounted on a revolving shaft, means revolving the shaft, agitating means in the receptacle, stationary heads at the ends of the receptacle, a chute communicating with an opening in one of said heads, a door in said head, a pipe communicating with the other head and connected to a blower, a blower, a duct communicating with the chute, a receiving-hopper and means for directing air from the blower longitudinally through the receptacle to cool the material therein, or in reverse direction to eject the material therefrom into the receiving-hopper.



4. In apparatus of the class described, comprising a horizontal revolving shaft, a substantially imperforate revolving receptacle mounted on the shaft, a screen at or near one end of the receptacle; a pipe communicating with one end of the receptacle, a duct communicating with the opposite end of the receptacle, a hopper interposed between the duct and the pipe, a blower, and a system of valves for directing draft longitudinally through the receptacle toward the screen for cooling the material being treated, and reversing the direction of the draft to eject the material from the receptacle into the hopper.

5. An apparatus of the class described comprising a revolving receptacle having two sets of agitating means therein, one of said sets of agitators positioned to lift the material and drop the same in substantially the same plane, the second set of agitators elevating the material and changing the direction of the same, a screen adjacent the second set of agitators, means for directing a draft of air through the receptacle, and means for changing the direction of the air and passing it through the receptacle in a reverse direction.

6. An apparatus of the class described comprising a revolving receptacle provided with a screen at or near one end, inclined agitators which elevate the material and deflect the same away from the screen, means for creating a draft in the receptacle, and means for changing the direction of the draft.

7. An apparatus of the class described, comprising a substantially closed receptacle provided with a screen, agitators located adjacent the screen and positioned to deflect material therefrom, a pipe connected to one end of the receptacle, a blower connected to the pipe, a duct communicating with the opposite end of the receptacle, a hopper communicating with the duct and the pipe, a screen interposed between the open ends of the duct and the pipe in the hopper, and means for altering the direction of the draft of air in the receptacle.

8. An apparatus of the class described comprising a substantially closed receptacle having stationary heads, a chute communicating with one head, a duct communicating with the chute, a valve closing the chute from the atmosphere, a hopper connected to the opposite end of the duct, a pipe communicating with the other end of the receptacle, said pipe communicating with the hopper and a blower, a blower, valves in the pipe, said valves coöperating with the valve in the duct to alter the direction of the draft in the receptacle, and means for gaining access to the receptacle

9. An apparatus of the class described comprising a revolving receptacle, agitators in the receptacle, a screen in the receptacle, other agitators positioned adjacent the screen to deflect material therefrom, a duct communicating with one end of the receptacle and provided with a valve, a hopper communicating with the duct, a pipe communicating with the opposite end of the receptacle, two valves in the pipe, one of which closes the pipe against admission of air direct from the atmosphere, a branch pipe communicating with the first-mentioned pipe and the hopper, a valve in the branch pipe between the first-mentioned pipe and the hopper, a blower connected to the branch pipe, a screen in the hopper between the opening of the branch pipe and the duct, the valves serving to direct air through the receptacle in either direction.

10. An apparatus of the class described comprising a horizontal shaft, a revolving receptacle mounted on the shaft and provided at or near one end with a screen, inclined agitators mounted on the interior of the receptacle to elevate the material and deflect the same away from the screen, and means for creating a draft in the receptacle.

11. An apparatus of the class described, comprising a revolving receptacle provided with two sets of agitators, and a screen, one of said sets of agitators being positioned to lift the material and drop it in substantially the same plane, the other set of agitators being inclined and positioned adjacent the screen, a chute for supplying the receptacle with material, a hopper connected with a blower, a blower, a connection between the hopper and the receptacle, a connection between the receptacle and the blower, and a system of valves whereby the air and material may be directed toward the screen, or the air-current reversed to clean the receptacle

12. In an apparatus of the class described, comprising a receptacle, a hopper, a blower, a pipe between the hopper and blower, a pipe connecting the pipe between the blower and hopper and the receptacle, an exit formed in said latter pipe, a pipe connecting the other end of the hopper and the opposite end of the receptacle, a screen in the hopper between the pipes communicating therewith, and a system of valves for directing the air from the blower through the receptacle in either direction.

813,956. VEHICLE-BODY CONSTRUCTION. ENOCH DENNEY, St. Louis, Mo. Filed May 8, 1905. Serial No. 259,367.

Claim.—1. The combination with a vehicle-body frame, having suitably-located apertures therein of panels adapted to fit on certain parts of the frame, there being dovetail grooves formed in the inner faces of said panels; strips detachably seated in said dovetail grooves, and bolts carried by said strips that pass through the apertures in the frame, substantially as specified.

2. In a vehicle-body construction, the combination with a vehicle-body frame, through certain parts of which are formed suitably-located apertures of panels adapted to be positioned on said frame, there being dovetail grooves formed in the inner faces of said panels; dovetail strips removably seated in said grooves; bolts carried by said strips, which bolts are provided with countersunk heads, and conical nuts adapted to be engaged on the outer ends of said bolts, substantially as specified.

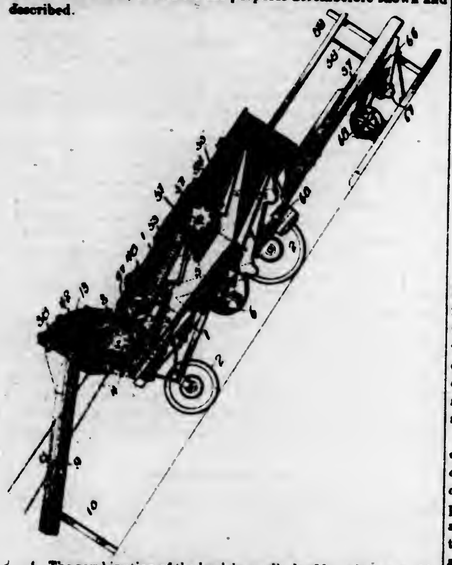
813,957. GRAIN THRESHING AND SEPARATING MACHINE. HENRY W. ESENHART, York, Pa., assignor to A. B. Farquhar Company, Limited, York, Pa. Filed June 20, 1905. Serial No. 266,127.

Claim.—1. The combination of a threshing-cylinder and concave, a casing or hood inclosing a space above the cylinder having side walls and a top, the side walls being cut away in front, offset plates secured to the side walls of the casing or hood opposite the cut-away parts thereof provided with bearings, and a feeder for the straw and grain to be threshed supported in the said bearings in the offset plates, substantially as set forth.

2. In a grain-threshing machine, the combination with the threshing-cylinder and concave and the straw and grain separating mechanism, of a curtain arranged in rear of the cylinder to prevent the grain thrown rearward thereby from flying out at the tail end of the machine—the curtain comprising a section, 50, hinged to the casing of the machine near its top and hanging downward therefrom, and of a width approximating the width of the machine, and a series of transversely-arranged sections, 49, independently hinged to the lower edge of the section, 50, from which they hang freely suspended, substantially as set forth.

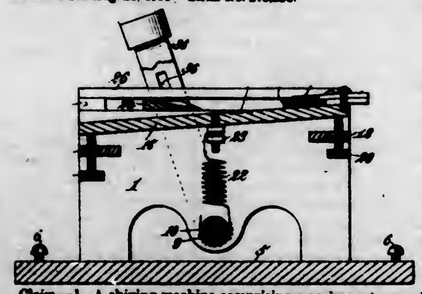
3. The concave having its curved side arms pivoted at their rear

ends to the side plates 15, and provided at their front ends with a cross-rod 26 connected to and extending between them, and the concave-adjusting devices, in combination with the feed-board 25, having its lower end resting on and engaging the cross-rod 26, and slotted plates 28 at its upper end engaging pins or studs 27 on the side walls of the frame, as and for the purposes hereinbefore shown and described.



4. The combination of the bruising-cylinder 51, and concave 52, the straw-separating shaker 5, the grain-cleaning shaking-shoe 7, the fan 6, the shaking-frame 57, arranged to receive the discharge from the shaking-shoe 7, and shaker 5, such shaking-frame having a serrated or ribbed bottom imperforate near its forward end and perforated toward the rear, means for supporting the frame 57 and imparting thereto longitudinal reciprocating movements, a collecting-chamber arranged below the perforated portion of the bottom of the frame, and a blast-fan 68 arranged to discharge into the said collecting-chamber, substantially as set forth.

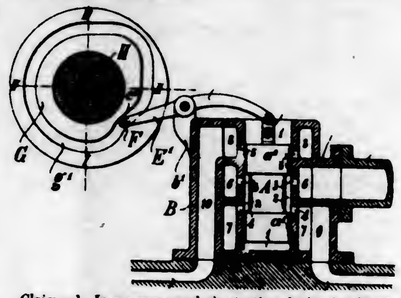
813,958. SKIVING-MACHINE. GEORGE W. EMERSON, Denison, Tex. Filed Aug. 23, 1905. Serial No. 275,236.



Claim.—1. A skiving-machine comprising a reciprocatory and transversely-movable loosely-mounted knife, an angularly-adjustable material-supporting plate associating with said knife, and an oscillatory lever independent of and loosely engaging with said knife for operating it when the lever is oscillated.

2. A skiving-machine comprising a reciprocatory and transversely-movable knife having an upwardly-extending guide-pin, a pair of retaining-bars for the knife and between which the knife extends, one of said bars provided with a diagonally-extending slot in which said pin operates during the reciprocation of the knife, thereby imparting a transverse movement to the knife, an angularly-adjustable material-supporting plate associating with said knife, and means for reciprocating the knife.

813,959. STARTING DEVICE FOR EXPLOSION-ENGINES. VICTOR EBERHARDT, Essen-on-the-Ruhr, Germany, assignor to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Filed Apr. 12, 1905. Serial No. 255,210.



Claim.—1. In a compressed-air starting device for double-acting four-cycle explosion-engines, means constructed to open communication for the compressed air first to one end of the cylinder and then to the other end of the cylinder and then to close communication with both ends of the cylinder during the succeeding reciprocation of the piston, and means for connecting the means first named to the driving member of the engine to be started, whereby, when the air is admitted to one end of the cylinder, the subsequent movements follow automatically.

2. In combination with a double-acting four-cycle explosion-engine and a suitable source of compressed air, a valve movable to open communication for the compressed air with first one end of the cylinder and then the other end of the cylinder and then movable to a position to cut off said air-supply from both ends of the cylinder, and a cam adapted to be driven by the engine, and constructed to impart the two opening movements during successive strokes of the engine and to move the valve to the cut-off position during the two following strokes of the engine.

3. In combination with a double-acting four-cycle explosion-engine, a suitable source of compressed air, passages leading to the respective ends of the cylinder and a valve constructed to assume two consecutive positions which open communication successively with the respective ends of the cylinder, and an intermediate position which cuts off communication with both ends of the cylinder, a cam imparting the three movements to the valve during different strokes of the engine's movements, and means for making and breaking connection between the cam and a driven member of the engine.

813,960. ADJUSTABLE HEAD FOR BRAKE-BEAMS. ROBERT L. ETTINGER, Washington, D. C., assignor, by mesne assignments, to The Damascus Brake Beam Company, Cleveland, Ohio, a Corporation of Ohio. Filed May 17, 1905. Serial No. 260,886.

Claim.—1. In an adjustable brake of the character described, the combination of a brake-beam, a brake-head holder fixedly secured to the beam, a brake-head having a bearing on the brake-head holder permitting its angular adjustment thereon, and connections between said holder and head both above and below the said bearing, releasable and permitting the relative adjustment between the head and holder.

2. In an adjustable head-brake, the combination of a beam, a brake-head holder fixedly secured to the beam and a brake-head having a bearing upon said holder, permitting relative angular adjustment between the head and holder and bolted to the holder both above and below said bearing; each bolt being shiftable in one of the parts through which it passes so as to permit the adjustment of the brake-head when the bolts are released.

3. The combination with a brake-beam, of a brake-head holder rigidly secured to said beam, a brake-head fitted to said holder, and set-bolts passing through said brake-head and brake-head holder to unite them; one of said united members being provided with two sets of series of bolt-holes to receive said set-bolts, substantially as set forth.

4. The combination with a brake-beam, of a brake-head holder rigidly secured to said beam and provided with bolt-holes, a brake-head having two sets of series of bolt-holes and fitted to said holder, and set-bolts passing through alined pairs of the bolt-holes in said brake-head and through the bolt-holes in said brake-head holder, substantially as set forth.

5. The combination with a brake-beam, of a brake-head holder rigidly secured to said brake-beam and provided with bolt-holes, a brake-head having side webs provided with two sets of series of bolt-holes and fitting over said holder, and set-bolts passing through alined pairs of said brake-head bolt-holes and through the bolt-holes in said brake-head holder, substantially as set forth.

6. The combination with a brake-beam, of a brake-head holder rigidly secured to said beam and provided with bolt-holes, a brake-head recessed at its rear side and provided with two sets of series of bolt-holes, set-bolts passing through alined pairs of the bolt-holes in said brake-head and through the bolt-holes in said brake-head holder; said brake-head being provided interiorly at its forward side with a swell arranged to bear against the forward side of said brake-head holder, substantially as set forth.

7. The combination with a brake-beam, of a brake-head holder rigidly secured to said beam and provided with bolt-holes, a brake-head recessed at its rear side and provided with two sets of series of bolt-holes, set-bolts passing through alined pairs of the bolt-holes in said brake-head and through the bolt-holes in said brake-head holder; said brake-head being provided interiorly at its forward side with a swell arranged to bear against the forward side of said brake-head holder and containing pockets into which the forward portion of said brake-head holder enters when the brake-shoe is adjusted, substantially as set forth.

813,961. NON-REFILLABLE BOTTLE. SAMUEL F. ETTINGER, Little Rock, Ark. Filed Apr. 13, 1905. Serial No. 255,337.

Claim.—The combination with a receptacle provided with a neck having a continuous interior taper, the lower portion of the tapering interior forming a valve-seat, and the upper portion being provided with screw-threads, a tapering plug exteriorly threaded to engage the tapered threaded portion of the neck and provided at the bottom with spaced projections forming supporting portions and providing intervening passages, said plug having a stopper-receiving opening, and a tapering cup-shaped valve arranged within the lower portion of the neck and adapted to be supported by the said projections when the receptacle is inverted.

813,962. AXLE-BOX. JAMES R. FLEMING, Swansea, Pa. Filed Apr. 17, 1905. Serial No. 255,916.

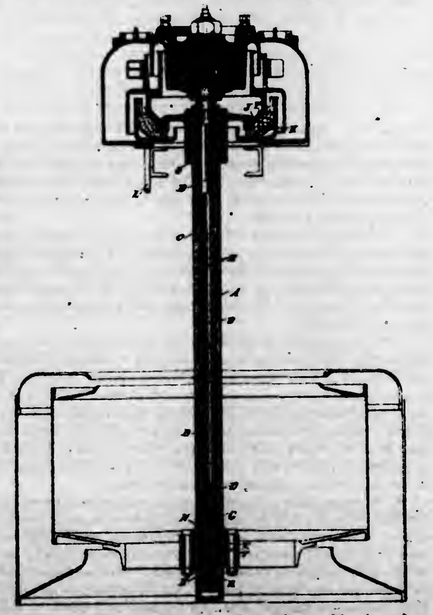
Claim.—1. An axle-box comprising a bracket having a horizontal member adapted to be attached to a car-sill and having vertical transverse brace members depending therefrom to a level adjacent to the axle center, a separate journal-block positioned beneath the horizontal member, said member being provided with means on its under side for holding said block against outward movement, a lubricant-holding member having its outer end positioned beyond the journal-block and having vertical sides adapted to slide in between the brace members of the bracket and the sides of the journal-block, said sides and outer end of the lubricant-holding member being carried above the axle-bearing, and means for attaching the lubricant-holding member to the bracket.

2. An axle-box comprising a bracket having a horizontal member adapted to be attached to a car-sill, a separate journal-block positioned beneath the horizontal member, said member being provided with a longitudinal rib depending therefrom to engage the outer end of said block at the top, and a lubricant-holding member having vertical sides embracing the sides of the journal-block, said sides being carried up to the top of the journal-block where they are provided with tongues, and said horizontal member of the bracket being provided with grooves on the under side thereof to receive said tongues.

3. An axle-box comprising a bracket having a horizontal member adapted to be attached to a car-sill, a separate journal-block positioned beneath the horizontal member, said member being provided with means on its under side for holding said block against outward movement, a lubricant-holding member having vertical sides embracing the sides of the journal-block, said sides being carried up to the top of the journal-block and being provided with inset ledges to engage and support the under sides of the journal-block, and means for attaching the lubricant-holding member to the bracket.

4. The combination, with an axle, a car-wheel loosely mounted thereon, the hub of said wheel having an annular lubricant-holding chamber, and a journal-block having a half-sleeve projecting into said chamber, of an axle-box comprising a bracket having a horizontal member adapted to be attached to a car-sill, said horizontal member being provided with means for holding the journal-block in place, a lubricant-holding member having a half-sleeve projecting into the wheel-hub chamber and having vertical sides and an outer end embracing the sides of the journal-block and inclosing the outer end of the axle, said sides and outer end being carried above the axle, and means for attaching the lubricant-holding member to the bracket.

813,963. CENTRIFUGAL MACHINE. ANDREAS PENTAG, Amsterdam, Netherlands, assignor to Watson, Laidlaw & Company, Glasgow, Scotland. Filed Jan. 6, 1903. Serial No. 83,998.



Claim.—1. In a centrifugal machine, the combination of an outer revolving spindle, an inner axially-movable spindle, a bush on the inner wall of said outer spindle, a bush on the outer wall of said

inner spindle, said inner spindle having a port discharging into the chamber formed between the two said bushes.

13. In an apparatus of the character specified for producing sound-vibrations in water, a sound-producing device comprising a

end, and an anchor consisting of a lower stratum of cement, a stratum of dirt, and an upper stratum of cement.

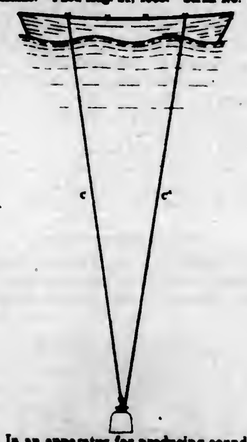
inner spindle, said inner spindle having a port discharging into the chamber formed between the two said bushes.

2. In a centrifugal machine, the combination of an outer revolving spindle, an inner axially-movable spindle, a bush rigidly secured to the inner wall of the revolving outer spindle, a bush rigidly secured to the outer wall of the inner stationary spindle, said inner spindle having a port for leading a fluid under pressure to the chamber formed between the two said bushes.

3. In a centrifugal machine, the combination of an outer revolving spindle, an inner axially-movable spindle, a ring on the inner wall of the outer spindle, a bush on the outer wall of the inner spindle, said ring and bush forming together with their respective spindle-walls a chamber for receiving a fluid under pressure, said inner spindle having a duct for leading the fluid under pressure to the said chamber.

4. In a centrifugal machine, the combination of two concentric hollow spindles, and bushes on the adjacent walls of said spindles forming with the walls of their respective spindles a chamber for the reception of a fluid under pressure.

813,964. MEANS FOR PRODUCING SOUND-VIBRATIONS IN WATER. HORACE B. GALE, Natick, and FRED M. DEWING, Boston, Mass., assignors to Submarine Signal Company, Waterville, Me., a Corporation of Maine. Filed Aug. 21, 1903. Serial No. 170,270.



Claim.—1. In an apparatus for producing sound-vibrations in water, the combination with separate means of suspension of a sound-producing device hanging pendent therefrom, the same comprising a resonant body, and means for sounding said resonant body by the transfer of the whole or part of the weight of said device from one suspending means to another.

2. In an apparatus for producing sound-vibrations in water, the combination with separate means of suspension of a sound-producing device hanging pendent therefrom, the same comprising a resonant body, a striker therefor, and means whereby said striker may be operated by the transfer of the weight of said device from one suspending means to another.

3. In an apparatus for producing sound-vibrations in water, the combination with a floating structure and separate means of suspension attached at their upper ends at separate points thereto, of a sound-producing device from the lower ends of which means of suspension said sound-producing device hangs pendent, the same comprising a submerged resonant body, a striker adapted to strike the same so as to produce sound, and means whereby said striker may be operated by the transfer of the whole or a part of the weight of said device from one suspending means to another.

4. In an apparatus for producing sound-vibrations in water, the combination with a floating structure and suspension-cords secured at their upper ends thereto of a sound-producing device from the lower ends of which cords said sound-producing device hangs pendent, the same comprising a submerged resonant body, a striker therefor, and means adapted to be operated upon for actuating said striker, which means is submerged with said resonant body and is so connected with one of said suspension-cords as to be operated upon thereby with the transfer of the weight of said device from one suspending-cord to the other.

5. In an apparatus for producing sound-vibrations in water, a bowl-shaped casing of large internal diameter to contain a powerful striking mechanism, a powerful striking mechanism within the same, and a resonating section at mouth of said casing of appreciably less internal diameter than the internal diameter of the casing, whereby the apparatus while producing sound of high pitch by reason of its small resonating section is designed by reason of the large bowl-shaped casing to contain striking mechanism of sufficient power for submarine signaling purposes.

6. In an apparatus for producing sound-vibrations in water, a bowl-shaped casing of large internal diameter to contain a powerful striking mechanism, a powerful striking mechanism within the same, a striker actuated by said mechanism, means for operating the mechanism from without the casing, and a resonating section at the mouth of said casing of appreciably less internal diameter than the internal diameter of the casing, whereby the apparatus while producing sound of high pitch by reason of its small resonating section, is designed by reason of the large bowl-shaped casing to contain striking mechanism of sufficient power for submarine signaling purposes.

7. In an apparatus for producing sound-vibrations in water, the combination with a floating structure and separate means of suspension attached at their upper ends at separate points thereto, of a sound-producing device from the lower ends of which means of suspension said sound-producing device hangs pendent, the same comprising a submerged resonant body, a striker adapted to strike the same so as to produce sound, means adapted to be operated upon by one of said means of suspension for raising said striker into a striking position, and an instantaneous release.

8. In an apparatus for producing sound-vibrations in water, the combination with a floating structure and separate means of suspension attached at their upper ends at separate points thereto, of a sound-producing device from the lower ends of which means of suspension said sound-producing device hangs pendent, the same comprising a submerged resonant body, a striker adapted to strike the same so as to produce sound, means connected to be operated upon by said means of suspension for actuating said striker, and a returning-spring for restoring said means to a normally operative position.

9. In an apparatus for producing sound-vibrations in water, the combination with a floating structure and two cords attached at their upper ends thereto of a sound-producing device from the lower end of which cords said sound-producing device hangs pendent, the same comprising a resonant body, a striker therefor, and means for receiving the draft exerted upon one of said cords by the weight of said sound-producing device or a portion thereof being transferred thereto from the other of said cords whereby the power thus obtained may be utilized to raise said striker to a striking position, means for effecting its instantaneous release, and means for maintaining the parts in a normal position to be operated upon by the draft aforesaid.

10. In an apparatus for producing sound-vibrations in water, the combination with a floating structure and two cords attached at their upper end at separate points thereto, of a sound-producing device from the lower end of which cords said sound-producing device hangs pendent, the same comprising a submerged resonant body, and an apparatus contained within the same for sounding said resonant body by the transfer of the weight of said device from one cord to the other, said apparatus consisting of a striker, a movable member adapted to be moved by the draft of one of the suspending-cords when the weight of the sound-producing device comes thereon and to impart its motion to the said striker to raise the same to a striking position, where it may become automatically released.

11. In an apparatus for producing sound-vibrations in water, the combination with two suspending-cords of a sound-producing device hanging pendent from the lower ends thereof, the same comprising a resonant body, a striker contained within the same, a lever connected to actuate said striker by the draft exerted by the weight of the said sound-producing device or a portion thereof being transferred from one of its suspending-cords to the other, and means for holding said lever in a normally operable position.

12. In an apparatus for producing sound-vibrations in water, the combination with two suspending-cords of a sound-producing device from the lower ends of which said sound-producing device hangs pendent, the same comprising a resonant body, a striker carried by the same, a lever connected with said striker for actuating it, and means for receiving the draft exerted by the weight of said sound-producing device or a portion thereof upon one of its suspending-cords, said draft-receiving means comprising means whereby the force obtained thereby may be multiplied and transformed to operate said lever, and a spring for holding said striker and its actuating parts in position to be operated upon as aforesaid.

13. In an apparatus of the character specified for producing sound-vibrations in water, a sound-producing device comprising a resonant body, a striker for sounding the same, a lever, a latch joined to said lever and adapted to engage with a portion of said striker so raising said striker to a striking position with an automatic release when the lever is moved in one direction, and which latch is adapted to assume a position to engage said striker as aforesaid when said lever is moved in another direction, and means for actuating said lever.

14. In an apparatus for producing sound-vibrations in water, the combination with two suspension-cords of a sound-producing device hanging pendent therefrom, the same comprising a resonant body, a striker for sounding the same, a lever connected to engage with said striker whereby it may be raised to a striking position with an instantaneous release, and one or more pulleys connecting with said lever around which pulley or pulleys one of said suspending-cords is adapted to be passed, substantially as and for the purposes set forth.

15. In an apparatus for producing sound-vibrations in water, the combination with two suspension-cords of a sound-producing device having pendent therefrom, the same comprising a resonant body, a striker pivotally hung by its arm within said resonant body for sounding the same, said arm of the striker being slotted at the point of its pivotal connection, a stop for said arm of the striker beyond the point of its said pivotal connection, a spring connected with the striker between said stop and said pivotal connection, and means for operating said striker by the transfer of the weight of said device or a portion thereof from one suspending-cord to the other.

16. In an apparatus for producing sound-vibrations in water, the combination with two suspension-cords of a sound-producing device hanging pendent therefrom, the same comprising a resonant body, a striker pivotally hung by its arm within said resonant body, a spring connecting at one end with said arm of the striker beyond the point of its pivotal connection, and at its other end with one arm of a lever, said lever, a pivoted latch secured to the other arm thereof and adapted to engage with an inclined surface of said striker, stop-surfaces for defining the position of said latch and means whereby said lever may be operated by the transfer of the weight of said sound-producing device, or a portion thereof from one suspending-cord to the other.

17. In an apparatus for producing sound-vibrations in water, a casing or shell forming an internal or resonating chamber, and a sound-bow or resonating member at the open mouth of said casing, which sound-bow has a mean diameter considerably less than the mean diameter of said casing taken between the sides thereof.

18. In an apparatus for producing sound-vibrations in water, a casing or shell forming an internal or resonating chamber and a sound-bow or resonating member at the open mouth of said casing, which sound-bow projects inwardly from said mouth of the casing to which it is secured, and so far that its mean diameter will be less than the mean diameter of said casing taken between the sides thereof, whereby said sound-bow will close to an appreciable degree the mouth of the casing and assist in forming or inclosing the said internal or resonating chamber.

813,965. PRODUCTION OF CEMENT. BERNHARD GRAU, Kratzwiek, near Stettin, Germany. Filed June 21, 1904. Serial No. 213,541.

Claim.—As an improvement in the mode of producing cement from molten slag, the method herein described of blowing a sufficiently strong and violent jet of superheated steam against a jet of the molten blast-furnace slag that the thus-divided slag is driven off by the steam-jet so as to form a heap of slag and in allowing this mass to cool in itself without artificial means, thereby enabling the heat of the slag to act on the mass during its cooling, and then grinding this mass to powder, as and for the purpose described.

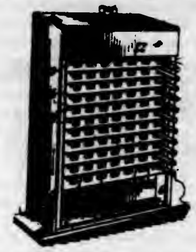
813,966. FENCE-POST. PHILIP J. HARMAN, Bloomfield, Ind. Filed Nov. 21, 1905. Serial No. 288,502.

Claim.—1. A fence-post composed of a single sheet of metal bent, in cross-section, into a double scroll-like formation with a space between its bent or rounded portions, that portion of the post opposite said space being flat to accommodate the fence-wires and formed with perforations for the binding-wires.

2. A fence-post having its edges bent or rolled inward to form a double scroll-like formation, in cross-section, and flared at its lower end, and an anchor consisting of a lower stratum of cement, a stratum of dirt, and an upper stratum of cement.

3. A fence-post composed of a single tapering sheet of metal bent, in cross-section, into a double scroll-like form, with a space between its bent or rounded portions, the upper portion of the post being of considerably less cross-sectional area than the lower portion.

813,967. SELF-IGNITING MATCH-SAFE. JOHN W. HART, La Harpe, Kans. Filed July 27, 1905. Serial No. 271,804.



Claim.—1. A match-safe provided with a plurality of partitions having flat faces at one side, said partitions being provided at the opposite side with ribs arranged at intervals and spacing the partitions, said ribs being fitted against the flat faces of the contiguous partitions and dividing the spaces between the partitions into individual match-receiving cells.

2. A match-safe provided with a plurality of partitions having flat faces at one side, said partitions being provided at the opposite side with ribs arranged at intervals and spacing the partitions, said ribs being fitted against the flat faces of the contiguous partitions and dividing the spaces between the partitions into individual match-receiving cells, and strips of abrasive material interposed between the ribs and the flat faces of the partitions.

3. A match-safe provided with a plurality of partitions having flat faces at one side, said partitions being provided at the opposite side with ribs arranged at intervals and spacing the partitions, said ribs being fitted against the flat faces of the contiguous partitions and dividing the spaces between the partitions into individual match-receiving cells, and removable strips fitted against the flat faces of the partitions and supported by the ribs.

4. A match-safe, comprising a casing provided with horizontally-disposed individual match-receiving cells extending from the front to the back of the casing, said casing being open at the front, and a back hinged to the casing and arranged to engage the matches for forcing the same into the cells.

5. A match-safe, comprising a casing open at the front and provided at opposite sides with vertical ways, horizontally-disposed partitions slidable in the ways and having flat faces at one side and provided at the opposite side with ribs fitted against the contiguous flat faces of the partitions and spacing the same and dividing the spaces between the partitions into individual match-receiving cells, said cells extending from the front to the back of the casing, removable abrasive material interposed between the ribs and the flat faces of the partitions, and an adjustable device for yieldably holding the partitions in engagement with the matches and positively retaining the partitions in engagement with the strips of abrasive material.

6. A match-safe having a plurality of partitions provided with individual match-receiving spaces or cells, said partitions being also provided with flanges, and strips of abrasive material secured to the partitions by the flanges.

7. A match-safe having a plurality of partitions provided at one side with individual match-receiving cells or spaces having match-engaging faces, said partitions being also provided at the opposite side with means for detachably holding strips of abrasive material.

813,968. LOOM FOR WEAVING PILE FABRIC. ALFRED HEALD, Philadelphia, Pa. Filed June 26, 1904. Serial No. 213,263.

Claim.—1. The combination in a loom for weaving cut pile fabrics, of a lay, pile-loop-forming fingers located in advance of the same and having elevated inner ends, mechanism for forming loops of pile warp-thread on said fingers and interweaving other threads therewith, and a reed having its bars so disposed that the spaces between them at points adjacent to the elevated inner ends of the fingers, will be narrower than at other points, substantially as specified.

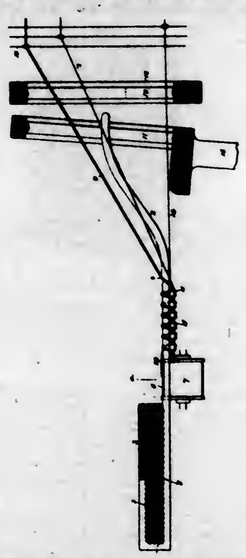
2. The combination, in a loom for weaving cut pile fabrics, of the lay and its reed, pile-loop-forming fingers located in advance of

813,969. SELF-ACTING MULE AND TWINER. ROBERT S. HEAP, Burnley, and GEORGE GREY, Cornholme, England. Filed Nov.

means into which the water from the melting ice drains, and means secured to the lower end of the tank for conducting away the water

for rotation thereon, a shaft supported independently of the bucket and carrying a stop member, stop-engaging means upon the bucket,

2. The combination, in a loom for weaving cut pile fabrics, of the lay and its reed, pile-loop-forming fingers located in advance of the lay, and a laterally-movable supplementary reed located in the rear of the main reed and serving to shog the pile warp-threads so as to cause them to operate first on one side of their respective fingers and then on the other side of the same, said supplementary reed having its bars so disposed that the spaces between them are narrower at the top than at the bottom, substantially as specified.



3. The combination, in a loom for weaving cut pile fabrics, of the lay and its reed, pile-loop-forming fingers located in advance of the lay, and a laterally-movable supplementary reed located in the rear of the main reed and serving to shog the pile warp-threads so as to cause them to operate first on one side of their respective fingers and then on the other side of the same, said supplementary reed having double bars whose members are disposed closely side by side at the bottom of the reed, but are separated at the top of the reed so as to contract, at that point, the spaces between the bars, substantially as specified.

4. The combination, in a loom for weaving cut pile fabrics, of pile-loop-forming fingers, mechanism for forming loops of pile warp-threads over said fingers and interweaving other threads therewith, a knife movable transversely across the tops of the fingers so as to sever the pile-loops as they are fed backwardly along the fingers, and means for imparting tension to said pile-loops at the time that the knife is acting upon the same, substantially as specified.

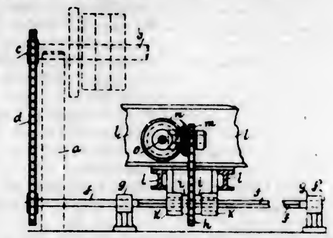
5. The combination, in a loom for weaving cut pile fabrics, of pile-loop-forming fingers, mechanism for forming loops of pile warp-threads on said fingers and interweaving other threads therewith, a knife movable transversely across the tops of the fingers for severing the pile-loops as they are fed backwardly along the fingers, and means for preventing rise of the cutting edge of said knife, substantially as specified.

6. The combination, in a loom for weaving cut pile fabrics, of pile-loop-forming fingers, mechanism for forming loops of pile warp-threads on said fingers and interweaving other threads therewith, a knife movable transversely across the tops of the fingers so as to sever the pile-loops as they are fed backwardly along the fingers, and means for preventing rise of the cutting edge of the knife and at the same time imparting tension to the pile-loops, substantially as specified.

7. As a new article of manufacture, a pile-loop-forming finger for looms, having on its upper edge a tongue for vertically confining the cutting edge of a knife moving transversely across the top of the finger, substantially as specified.

8. As a new article of manufacture, a pile-loop-forming finger for looms, having at its upper edge a recess for the reception of a transversely-moving knife, and a tongue extending over said recess so as to vertically confine the cutting edge of the knife, substantially as specified.

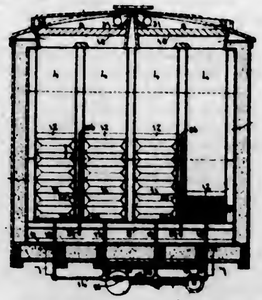
813,969. **SELF-ACTING MULE AND TWINER.** ROBERT S. HEAP, Burnley, and GEORGE GREY, Cornholme, England. Filed Nov. 11, 1904. Serial No. 232,256.



Claim.—1. In combination with the head-stock, carriage-frame and tin roller-shaft of a self-acting mule or twiner, a driving-shaft and a long shaft extending along the path of travel of the carriage, direct gearing between the driving-shaft and long shaft, and gearing connecting the tin roller-shaft and said long shaft, traveling with the carriage along said long shaft.

2. In combination with the head-stock, carriage-frame and tin roller-shaft of a self-acting mule or twiner, a driving-shaft, a gear thereon, a long shaft extending along the path of travel of the carriage, a gear on said long shaft and a chain between it and the driving-shaft, mechanism carried by the carriage for operating said tin roller-shaft, said mechanism adapted to engage said long shaft so as to be turned thereby, and adapted to slide longitudinally upon said long shaft.

813,970. **REFRIGERATOR-CAR.** ERVIN P. HINDS, New York, and GEORGE B. PAYNE, Long Island City, N. Y. Filed July 10, 1903. Serial No. 165,973.



Claim.—1. In a refrigerator-car, the combination, with an ice-tank, of a movable false bottom therein, and means for applying air-pressure beneath said bottom to cause it to rise with the superposed ice as the latter melts.

2. In a refrigerator-car, the combination, with an ice-tank, of a movable false bottom therein, a collapsible air-bag beneath said bottom, and means for supplying air under pressure to said bag to elevate the false bottom and the superposed ice as the latter melts.

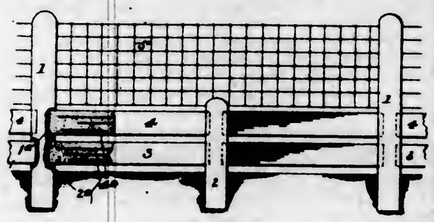
3. In a refrigerator-car, the combination, with an ice-tank, of a movable false bottom therein, means for elevating said false bottom and the superposed ice by air-pressure as the ice melts, an air connection between said means and the train-pipe system, and a reducing-valve in said connection to transmit the air from the train-pipe system at the required pressure.

4. In a refrigerator-car, the combination, with an ice-tank, of a movable false bottom therein, a collapsible air-bag beneath said bottom, pipe connections leading from said bag to the train-pipe system, and a reducing-valve in said pipe connection to transmit the air to the air-bag at the required pressure.

5. In a refrigerator-car, the combination, with an ice-tank, of a movable false bottom therein, a collapsible air-bag beneath said bottom, pipe connections leading therefrom to an air-supply tank, and means for maintaining air in said tank at the required pressure.

6. In a refrigerator-car, the combination, with an ice-tank, of a movable false bottom therein, means for elevating said false bottom and the superposed ice by air-pressure as the ice melts, a water-space being provided below the false bottom and around the elevating means into which the water from the melting ice drains, and means secured to the lower end of the tank for conducting away the water from said space

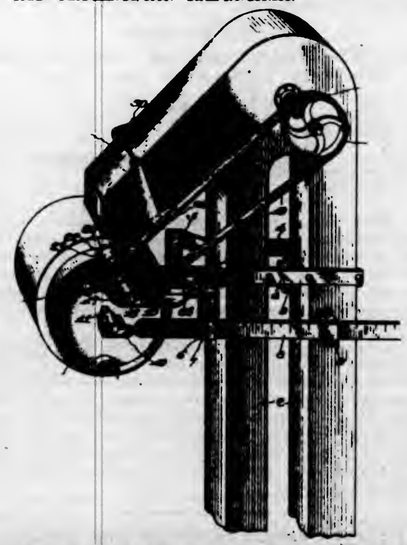
813,971. **FENCE.** JAMES HINDS, Paris, Ill. Filed Nov. 20, 1905. Serial No. 288,205.



Claim.—1. A fence, equipped with concrete or cement base-boards, posts having mortises to receive the ends of said boards, and formed of wooden cores wrapped in paper or tin and having the latter suitably secured thereon, and the whole incased in concrete or cement.

2. A fence, equipped with base-boards of concrete or cement, and posts having mortises effective to receive the ends of said boards and formed of wooden cores wrapped in tin or paper, and having headed projections and the whole embedded in cement or concrete as set forth.

813,972. **WEIGHING-MACHINE.** HIRAM S. HIXSON, Hillsboro, Iowa. Filed Mar. 24, 1905. Serial No. 251,858.



Claim.—1. In a weighing-machine, a tilting beam, a bucket supported thereby for rotation and having a diametrical partition and apertures adjacent thereto, a friction-rim connected with said bucket and having peripheral indentations and recesses, and an independently-supported shaft having a fixed and a loose pulley disposed for engagement with said rim and indentations and with said recesses respectively.

2. In a weighing-machine, a tilting beam, a bucket supported thereby for rotation and having a partition and diametrically opposite apertures, a friction-rim connected with said bucket and provided with diametrically opposite indentations and with relatively small recesses adjacent to said indentations, an independently-supported driven shaft, a loose pulley upon said shaft adapted for locking engagement with the small recesses, and a friction-wheel fixed upon said shaft for engagement with the friction-rim.

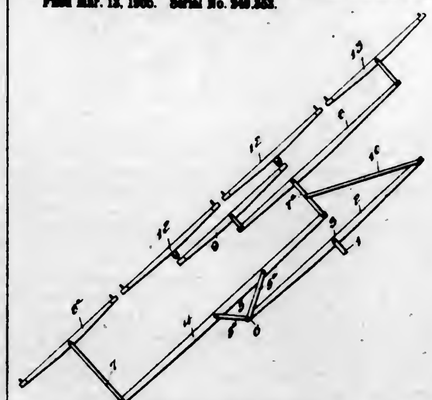
3. In a weighing-machine, a tilting beam, a bucket supported for rotation thereon, a shaft supported independently of the bucket and carrying a stop member, stop-engaging means upon the bucket, a friction-wheel upon the shaft, friction means upon the bucket adapted for engagement with said friction-pulley to be thereby driven when the bucket is depressed until the stop means upon the shaft and the bucket enter into engagement.

4. In a weighing-machine, a tilting beam, a bucket supported for rotation thereon, said bucket having a transverse partition and diametrically opposite apertures adjacent to the ends of said partition, adjustable weights upon the tilting beam, means for locking the bucket in position when overbalanced by the weights, and friction means for restoring said bucket to locked position after being tripped and partially rotated by the weight of material contained therein.

5. In a weighing-machine, a tilting beam, a bucket supported for rotation thereon and having a locking-recess, an independently-supported locking member disposed for engagement with said recess, friction means for rotating the drum when disengaged from the locking member, a pivotally-supported gate, and means for actuating said gate when the bucket is tripped out of engagement with the locking member.

6. In a weighing-machine, a tilting beam, a bucket supported for rotation thereon and having a locking-recess, said bucket being provided with an aperture for the admission of material to be weighed, a feed-spout, an independently-supported locking member disposed for engagement with the locking-recess of the drum, friction means for rotating the drum when disengaged from the locking member, a shaft supporting the friction means and the locking member, a pivotally-supported gate, and a link connecting said gate with the tilting beam to actuate said gate when the bucket is tripped out of engagement with the locking member.

813,973. **DRAFT-EQUALIZER.** WILLIAM B. KENT, Harlan, Iowa. Filed Mar. 13, 1905. Serial No. 249,853.



Claim.—In a draft-equalizer, the combination of the bar 1, the beam 2, the equalizing-bar 4, the rigid brace 5 composed of the angularly-extending elements 5ª pivotally connecting the bar 4 to the beam 2, the links 7 and 7', the swingletree 8 and evener parts 8, 9, 12 and 13, connected with said links 7 and 7', and the equalizing-link 10 connecting the beam 2 to the adjacent link 7'.

813,974. **TWIN-HEAD ROTARY ENGINE.** HOMER A. KING, Colton, Cal. Filed Aug. 5, 1905. Serial No. 272,267.

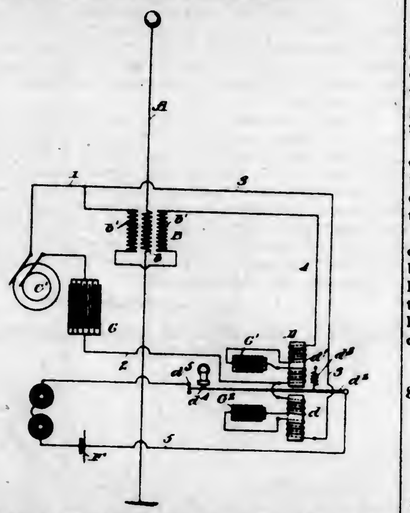
Claim.—1. One or more pistons and trailing cylinder-heads, within an annular cylinder of a rotary engine, connected to a disk and shaft revolved by the pressure of a motive fluid.

2. One or more pistons and trailing cylinder-heads having a cavity in each of the latter or in all, in which the ends of an elastic con-

section are secured, and a disk to which the pistons are secured within an annular cylinder of a rotary engine revolving a shaft by pressure of a motive fluid.

3. Within the annular cylinder of a rotary engine, a piston, a trailing cylinder-head having elastic connection therewith, with bolts movable by the pressure of a motive fluid, automatically locking the cylinder-head to the cylinder, and automatically unlocking it by the diminishing pressure and elastic connection to the piston, said piston being secured to a disk revolving a shaft by the pressure of a motive fluid.

813,975. **WIRELESS TELEGRAPHY.** JAMES P. KING, Washington, D. C. Filed Jan. 8, 1903. Serial No. 138,276.



Claim.—1. The method of receiving wireless-telegraph messages which consists in normally impressing local generator-currents on two branch circuits, causing the currents in said circuits to set up opposing magnetic fields one of which is normally stronger than the other, and causing received oscillations to act to vary the normal relation between said fields.

2. The method of receiving wireless-telegraph messages which consists in normally impressing local generator-currents on two branch circuits, causing the currents in said circuits to set up opposing magnetic fields one of which is normally stronger than the other, subjecting a body normally to the opposing actions of said fields, and causing received oscillations to act to vary the normal relation between said fields.

813,976. **METAL BOX.** GOTTLIEB KLEMM, Defiance, Ohio, assignor to The Clipper Plow Company, Defiance, Ohio, a Corporation of Ohio. Filed Apr. 13, 1905. Serial No. 255,625.

Claim.—1. A metal box comprising ends, sides and bottom sections, means for fastening the ends and sides together, reinforcing-strips at the outer edges of the bottom, the reinforcing-strips and the ends and sides of the box being crimped to form an outwardly-extending flange at the lower edges of the box, said strips extending inwardly against bottom of the box and headed to form a projection horizontally spaced from the said flange.

2. A metal box comprising ends, sides and bottom sections, means for fastening the ends and sides together, a reinforcing outwardly-projecting flange at the lower edges of the box, and a projection next to and extending from the bottom of the box said projection being spaced horizontally from the outwardly-projecting flange.

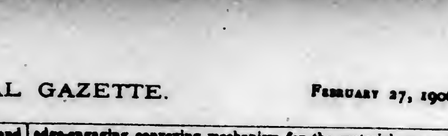
3. A metal box comprising sides, ends and bottom sections, the sides and ends being crimped at the meeting edges to form outwardly-projecting flanges, a reinforcing-strip on the bottom, the sides, ends and bottom being crimped around the outer edge of the reinforcing-strip to form an outwardly-projecting flange at the lower edge of the box, and a depending projection on the inner edge of said reinforcing-strip, said projection being spaced from the outwardly-projecting flange formed at the lower edge of the box.

4. A metal box comprising side, end, and bottom sections, a reinforcing-strip at the outer edges of the bottom, said strip being parallel with and fitting against the under side of the bottom, the edges of the sides, ends, and bottom being crimped around the edge of the reinforcing-strip to form a reinforcing outwardly-projecting flange, the inner edge of the reinforcing-strip being bent to form a projecting head which is spaced from the outer edge of the reinforced flange.

5. A metal box formed with a depressed flange near its upper edge, a metal cover supported by the depressed flange, said cover being reinforced by beading its edges around a strengthening-wire located on the under side of the cover to form a flat surface on top of the cover.

6. A metal box formed with a depressed flange near its upper edge, a metal cover supported by the depressed flange, said cover being reinforced by beading its edges around a strengthening-wire located on the under side of the cover to form a flat surface on top of the cover, a depression formed adjacent one edge of the cover, and a lock, the upper end of which is flush with the top of the cover, and operating in the depression.

813,977. **TITRATION APPARATUS.** RUDOLF KÖNIG, Gelsenkirchen, Germany. Filed Aug. 25, 1905. Serial No. 275,317.



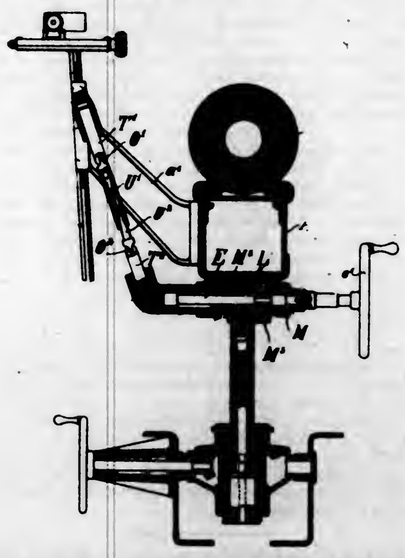
Claim.—1. In a titration apparatus the combination with a graduated burette of a closed supply vessel, of tubes at the top of the burette, one connecting it with the bottom of the supply vessel, and the other connecting it with the air-space of the same, and of a three-way cock at the top of the burette having passages to said connecting-tubes and having a third passage adapted to admit air into the burette substantially as described.

2. In a titration apparatus the combination with a graduated burette of a closed supply vessel, of tubes at the top of the burette, one connecting it with the bottom of the supply vessel, and the other connecting it with the air-space of the same, and of a three-way cock at the top of the burette having passages to said connecting-tubes and having a third passage adapted to admit air into the burette, of a stop-cock in the tube connecting the burette with the bottom of the supply vessel, and of ground joints in both connecting-tubes substantially as described.

813,978. **MACHINE FOR DIGGING BEETS.** ALLINGTON H. KRAMER, Monte Vista, Colo. Original application filed July 21, 1904, Serial No. 217,469. Divided and this application filed June 20, 1905. Serial No. 265,748.

Claim.—In a machine or lifting beets out of the ground, an axle, supporting-wheels secured to the axle, a sleeve loosely mounted on the said axle, having a clutch-surface at one end, a clutch operating on the axle and arranged for engagement with the clutch-surface of the said sleeve, gears secured on the sleeve and axle, a frame mounted to turn on the axle between the said gears, the said frame being provided with opposing segmental slots, beams located at the outer portions of the said frame, the rear ends of the said beams being curved downwardly and forwardly, a shaft connecting said beams and carried through the said slots in the frame, a lever operatively connected with the frame and with the said connecting-shaft for the beams, a shovel or scoop plow carried by the lower portion of the said beams, and an elevator carried by the said frame, over which a portion of the plow extends, substantially as described.

813,979. **ELEVATING MECHANISM AND SIGHTING DEVICE FOR GUNS.** OTTO LAUBER and FRIEDRICH STOCK, Essen-on-the-Ruhr, Germany, assignors to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Filed Sept. 26, 1905. Serial No. 280,109.



Claim.—1. In a gun provided with means for simultaneously adjusting its sight and elevating mechanism, also means imparting a horizontal training movement to the upper part of the mount; a yielding connection through which adjusting movement is imparted to the sight.

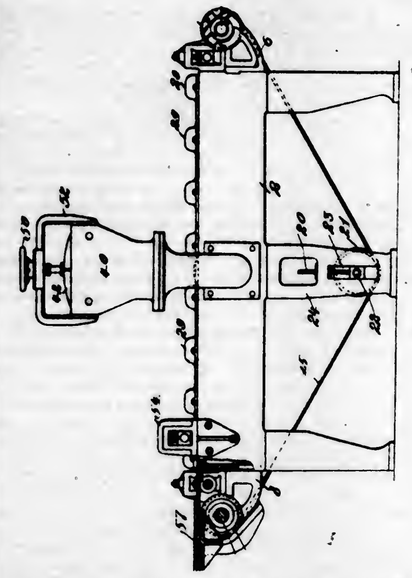
2. In a gun having an upper carriage movable horizontally on the lower carriage, a sight supported from the upper carriage, and means mounted on the lower carriage for simultaneously elevating the gun and shifting its sight; a yielding connection through which the shifting movement is imparted to the sight, whereby the control of the said sight is maintained at any horizontal adjustment of the upper carriage.

3. In a gun having an elevating mechanism, and an adjustable sight mounted respectively on the upper and lower portions of the carriage and means for relatively adjusting said portions of the carriage horizontally for the training of the gun; rotating shafts mounted respectively on the support for the sight and the lower portion of the carriage, having connections through which they are respectively adapted to adjust the elevating mechanism and said sight, and a yielding connection between said shafts whereby they may be driven simultaneously.

4. In a gun having horizontal training movement, a vertically-adjustable sight and means for elevating the gun, rotary shafts controlling the elevating and sight-adjusting means, and a yielding connection between said shafts consisting of a telescoping shaft and joints between the respective parts of the telescoping shafts and the shafts to be connected.

813,980. **SILVERING-MACHINE.** CLAUDE S. LAVAL, Pittsburg, Pa. Filed May 20, 1905. Serial No. 261,492.

Claim.—1. A machine of the class described including a supporting-table, oppositely-disposed frictional conveying means for moving material being treated over said table, means on the table for automatically adjusting said conveying means, and means for applying liquid coating substance to said material.



2. A machine of the class described including a supporting-table, frictional conveying mechanism thereon, means for automatically adjusting said frictional mechanism to maintain the same in contact with the material, and means for feeding liquid substance to the latter.

3. A machine of the class described including a supporting-table, endless conveying mechanism at opposite sides of said table for frictionally engaging the material, automatically-adjustable guide members for the conveyers, and means for feeding a liquid coating to the material.

4. A machine of the class described including a supporting-table, an intake-table at one end thereof, endless conveying mechanism for frictionally engaging the material, automatic guide members for said conveying mechanism, a hopper, and means cooperative therewith for feeding liquid coating to the material treated.

5. A machine of the class described including a supporting-table, rotatable endless conveying mechanism, means for adjusting the same, automatic guide members for the conveying mechanism, and means for feeding liquid coating to the material treated.

6. In a machine of the class described, a supporting-table, an intake-table, endless belts for frictionally engaging the material to convey the same over said table, means for adjusting the belts, automatic guide means for the latter, and means for supplying a liquid coating to said material.

7. In a machine of the class described, a supporting-table, traveling endless belts to frictionally engage the material for conveying the same over said table, adjustable guide members for said belts, automatic means for maintaining the belts in frictional engagement with the material being treated cooperative with said members, a supply-pipe, a feed-trough connected to said pipe for introducing a liquid coating to the material treated, and a hopper for supplying liquid to said feed-pipe.

8. A machine of the class described including endless conveying mechanism, adjustable guide members for the latter, and automatic, adjustable means carried by said members for maintaining the said conveying mechanism in frictional engagement with the material being treated.

9. A machine of the class described including endless conveying mechanism, adjustable guides therefor, automatic means cooperative with said guides for maintaining the said conveying mech-

anism in frictional engagement with the material being treated, and means for feeding a liquid coating to the material treated.

10. In a machine of the class described, a supporting-table having edge-engaging conveying mechanism for the material, means for automatically adjusting said mechanism, and means for supplying liquid substance to the said material.

tanks, a valved bell in each tank, means for limiting the upward movement of said bell, and automatic means whereby the fall of one

blade pivoted to a handle and means for limiting the pivotal movement of the blade.

anism in frictional engagement with the material being treated, and means for feeding a liquid coating to the material treated.

10. In a machine of the class described, a supporting-table having a conveying mechanism at opposite sides thereof, means for automatically adjusting said conveying mechanism, means for feeding a liquid coating to the material, and means for heating the said feeding means.

11. A machine of the class described including a supporting-table, pulleys at opposite sides of said table, conveyers on said pulleys, guide members for said conveyers, automatic means cooperative with said members for maintaining said conveyer in frictional engagement with the material being treated, and means for feeding liquid to the material treated.

12. A machine of the class described including a supporting-table having a transverse opening, an adjustable feed-trough below said opening, a liquid-receiving hopper having a feed-pipe communicating with said trough a valve mechanism controlling the supply to said trough pulleys on said table, endless conveying mechanism on said pulleys, and adjustable guides having automatic means for maintaining said conveying mechanism in frictional engagement with the material being treated.

13. A machine of the class described including a supporting-table having a transverse opening, an adjustable feed-trough below said opening, a liquid-receiving hopper having a feed-pipe communicating with said trough, a valve mechanism controlling the supply to said trough, pulleys for said table, endless conveying mechanism on said pulleys, adjustable guides having automatic means for maintaining said mechanism in frictional engagement with the material being treated, and means for keeping said conveyer mechanism taut.

14. A machine of the class described having a supporting-table with intermediate means for feeding a coating substance thereto, and automatically-adjustable frictional edge-engaging devices for conveying the material to be coated over the table.

15. A machine of the class described having a supporting-table with an intermediate opening for feeding a coating substance therethrough, and means for frictionally engaging the material for conveying the same to be coated over the table close to said opening.

16. A machine of the class described having a supporting-table with an intermediate opening for feeding a coating substance therethrough, a receptacle adjacent to said opening for the coating substance, frictional engaging mechanism for conveying the material to be coated over the table and means for holding the material close to said opening.

17. A machine of the class described having a supporting-table with an intermediate opening for feeding a coating substance therethrough, an adjustable receptacle adjacent to said opening for the coating substance, and mechanism frictionally contacting with the material for conveying the same to be coated over the table close to said opening

18. A machine of the class described having a supporting-table with an intermediate opening for feeding a coating substance therethrough, an adjustable receptacle under the table adjacent to the opening for the coating substance, mechanism for conveying the material to be coated over the table close to said opening, and means for automatically adjusting said mechanism to frictionally engage the same with the material.

19. A machine of the class described having a supporting-table with intermediate means for feeding a coating substance thereto, automatically-adjustable conveying mechanism, and means for regulating the feed of the coating substance to the table.

20. A machine of the class described having a supporting-table with an intermediate opening for feeding a coating substance therethrough, an adjustable feed-receptacle having oppositely-disposed ledges, below said opening the latter extending beyond the opening, and mechanism for conveying the material to be coated over the table close to said opening.

21. A machine of the class described having a supporting-table provided with an intermediate opening, an adjustable feed-receptacle having a slot coextensive with said opening under the table adjacent to said opening, an automatically-adjustable conveying mechanism for engaging the edges of the material to be coated, and means for supplying the liquid substance to the said feed-receptacle.

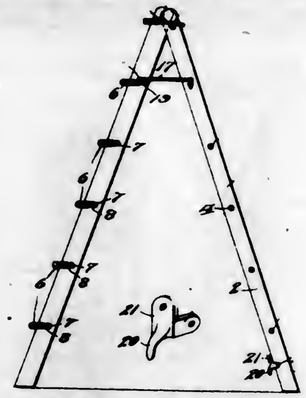
22. A machine of the class described including a supporting-table having frictional edge-engaging conveying mechanism for the material, automatically-adjustable guide means for the said mechanism, and means for feeding liquid coating substance to the material.

23. A machine of the class described having a supporting-table provided with an intermediate opening, a feed-receptacle coextensive with said opening, ledges forming troughs on said receptacle below the opening and extending beyond the same, oppositely-disposed edge-engaging conveying mechanism for the material, means for automatically adjusting said mechanism, and means for supplying liquid substance to the said receptacle.

24. A machine of the class described having a liquid coating feed device for the material, automatic frictional edge-engaging mechanism for conveying the material to be coated over the table, and a yieldable pressure means above the latter.

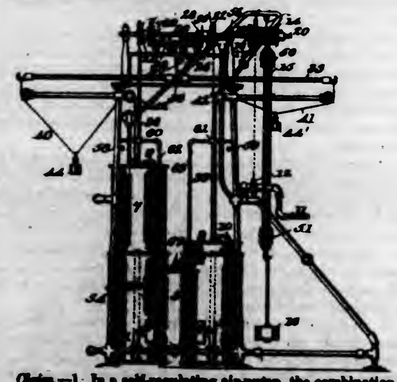
25. A machine of the class described having automatic frictional edge-engaging mechanism for conveying the material to be coated over the same, yieldable pressure means above the table at one and thereof, and means for supplying liquid coating substance to the material.

813,981. LADDER. ROBERT C. LAYSON, Elkridge, Md. Filed May 20, 1905. Serial No. 261,202.



Claim.—In a device of the class described, a ladder-section comprising side bars, connecting members attached to said bars and each consisting of a shank having at one end, a rung-engaging hook, and at its other end, a right-angularly-disposed bearing portion, and a perforated laterally-projecting ear situated between the ends of the shank, and a second ladder-section adapted for relative movement longitudinally of the first-named section and having side bars, the side bars of the second section being engaged by the bearing portions of the connecting members.

813,982. SELF-REGULATING AIR-PUMP. MAXIMILIAN LOEWENSTERN, Brussels, Belgium, assignor of two-thirds to Jonas Stark, Brussels, Belgium, and Maurice Kind, New York, N. Y. Filed Apr. 14, 1905. Serial No. 255,617.



Claim.—1. In a self-regulating air-pump, the combination of a series of bells, means for lifting said bells alternately and automatically, and connections whereby the fall of one bell immediately causes it to be lifted and at the same time releases another bell, substantially as described.

2. In a self-regulating air-pump, the combination of a series of tanks, a valved bell in each tank, means for limiting the upward movement of said bell, and automatic means whereby the fall of one bell immediately causes it to be lifted and at the same time releases an adjacent bell, substantially as described.

3. In a self-regulating air-pump, the combination of a series of tanks, a reservoir connected to said tanks, a gravity-bell located in each of said tanks, means for lifting said bells, means for limiting the upward movement of said bells, and means whereby the fall of one bell causes said bell to be lifted and at the same time releases an adjacent bell allowing it to fall, substantially as described.

4. In a self-regulating air-pump, the combination of a series of tanks, a reservoir connected to said tanks, and a check-valve between said reservoir and each of said tanks, a series of gravity-bells, one located in each of said tanks and each provided with an automatic valve at or near its top, means for lifting said bells, means for limiting the upward movement of said bells, and automatically-operated means whereby the fall of one bell causes it to be at once lifted and at the same time releases an adjacent bell, allowing it to fall, substantially as described.

5. In a self-regulating air-pump, the combination of a series of tanks, a valved gravity-bell in each tank, operating means for lifting each bell, means for limiting the upward movement of each bell, and shifting mechanism operated by the fall of the bells respectively whereby the fall of one bell causes it at once to be lifted by the operating means and simultaneously releases an adjoining bell allowing it to fall, substantially as described.

6. In a self-regulating air-pump, the combination of a series of tanks, a valved bell in each tank, a weight-operated shaft, connections whereby the rotation of said shaft lifts said bells alternately, means for limiting the movement of said bells, and shifting mechanism located on said shaft, whereby the fall of one bell causes it to be immediately lifted by said shaft, and at the same time releases an adjoining bell allowing it to fall, substantially as described.

7. In a self-regulating pump, the combination of two tanks, a valved bell in each tank, a weight-operated shaft, sprocket-wheels on said shaft connected to said bells respectively, means for limiting the upward movement of each bell, and shifting mechanism whereby the fall of either bell immediately causes it to be lifted by the operation of said shaft, and at the same time releases the other bell allowing it to fall, substantially as described.

8. In a self-regulating air-pump, the combination of two tanks, a valved bell in each tank, a weight-operated shaft, sprocket-wheels loosely mounted on said shaft, and connected to said bells respectively, shifting mechanism adapted to engage said sprocket-wheels alternately, and an operating-lever connected to said shifting mechanism and to said bells, whereby the fall of either bell causes it to be lifted at once and at the same time releases the other bell, allowing it to fall, substantially as described.

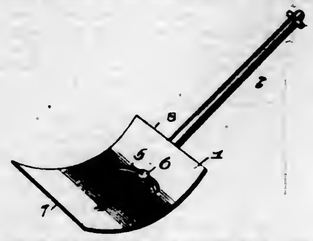
9. In a self-regulating air-pump, the combination of two tanks, a valved bell in each tank, a weight-operated shaft, two sprocket-wheels loosely mounted on said shaft and connected to said bells respectively, sliding pulleys mounted on said shaft, a sliding frame for operating said pulleys, and a compound lever for operating said frame, one end of said lever being operated by the fall of either of said bells, substantially as described.

10. In a self-regulating air-pump, the combination of two tanks, a valved bell in each tank, an operating-shaft, sprocket-wheels loosely mounted on said shaft and connected to said bells respectively, a drum loosely mounted on said shaft, a cord mounted on said drum, a weight attached to said cord, ratchet mechanism between said drum and said shaft, means for winding up said drum, and shiftable clutch devices adapted to engage said sprocket-wheels successively, said devices being shifted by the fall of any one of said bells substantially as described.

11. In a self-regulating air-pump, the combination of two tanks, a reservoir connected thereto, a valved bell in each tank, an operating-shaft, sprocket-wheels loosely mounted on said shaft and connected to said bells respectively, said sprocket-wheels being provided with ratchet-faces, pulleys slidably mounted on said shaft, and means for shifting said pulleys, consisting of a plate provided with forks engaging said pulleys, a compound lever engaging said plate, and a cord extending from each end of said lever to said bells respectively, substantially as described.

813,988. SNOW-SHOVEL. WILLIAM D. LUSBY, Denison, Iowa. Filed July 1, 1905. Serial No. 267,851.

Claim.—1. A snow-shovel comprising a curved sheet-metal blade pivoted to a handle and means for limiting the pivotal movement of the blade.



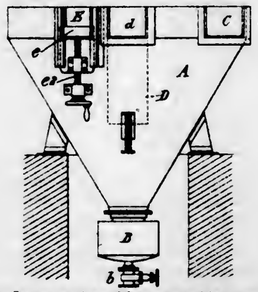
2. A snow-shovel comprising a reversible blade, said blade being curved longitudinally.

3. A snow-shovel comprising a curved sheet-steel blade, pivotally connected to a handle and provided with a curved slot, and a bolt passing through the slot and connected to the handle to permit the blade to have a limited lateral movement on its pivot.

4. A snow-shovel provided with a reversible blade pivoted to a handle and means for limiting the pivotal action of the blade.

5. A snow-shovel consisting of a curved sheet-steel blade, a handle having a curved seat or bearing for said blade, a bolt for pivoting the blade to the seat or bearing, said blade having an arc-shaped slot therein, and a bolt passing through the slot and handle to limit the pivotal movement of the blade.

813,984. PAPER-MAKING APPARATUS FOR SEPARATING SAND, METAL, AND OTHER IMPURITIES FROM PULP. JOSEPH MACNAUGHTON, Edinburgh, Scotland. Filed Nov. 23, 1905. Serial No. 288,764.



Claim.—1. In connection with paper-making apparatus, a casing, or vessel, such as A, situated so that the pulp passes through it on its way to the breast of the paper-making machine, the said casing, or vessel, being provided, at bottom, with a box, or receptacle for heavy impurities, and having an outlet, communicating with the interior of the said casing, or vessel, for the escape of purified pulp; substantially as hereinbefore described.

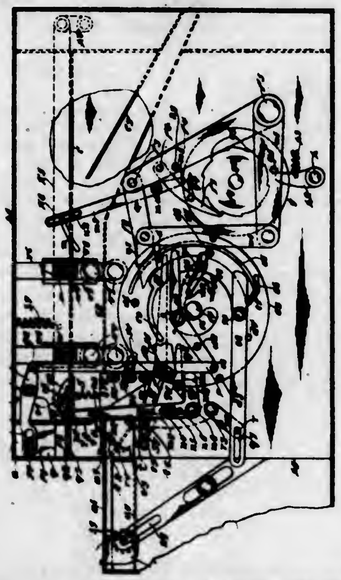
2. In connection with a paper-making apparatus, a casing adapted to permit the pulp to pass through it on its way to the breast of the paper-making machine, a box at the bottom of said casing for heavy impurities, and an outlet from said casing, in combination with an outlet for lighter impurities.

3. In combination with a paper-making machine, a casing adapted to permit the pulp to pass through on its way to the breast of the paper-making machine, an inlet passing tangentially into said casing, a box at the bottom of said casing for heavy impurities, and a central outlet from said casing for the escape of purified pulp.

4. In connection with a paper-making machine, a casing adapted to permit the pulp to pass through it on its way to the breast of the paper-making machine, an inlet passing tangentially into said casing, a box at the bottom of said casing for heavy impurities, and a central outlet from said casing for the escape of purified pulp, in combination with an adjustable outlet for lighter impurities at the side of said casing.

813,985. MACHINE FOR SEALING AND STAMPING ENVELOPES. CHARLES A. MADDEN, Brooklyn, N. Y. Filed June 21, 1902. Serial No. 112,668.

Claim.—1. A machine of the class described, comprising a suitable frame or casing, a stamp-sheet table located in the top portion thereof, a supplemental envelop-table arranged beneath the stamp-table, a main envelop-table at the front of the machine and in the same horizontal plane as the supplemental envelop-table, a depressible flap-folder mounted transversely of the machine between the main and the supplemental envelop-tables and normally slightly above said tables a swinging moistening-tank mounted transversely of the machine in front of the flap-folder means for depressing the flap-folder and for swinging the moistening-tank, and means for applying a stamp to the envelop, substantially as shown and described.



2. A machine of the class described, provided with main and supplemental envelop-tables, a vertically-movable spring-supported envelop-flap folder placed transversely of the machine between said tables and normally held above the same and the front side of which is inclined downwardly and backwardly, a plurality of pairs of rollers arranged rearwardly of said flap-folder the separate parts of each pair being mounted respectively above and below the supplemental envelop-table and being in frictional contact, a moistening-tank supported transversely of the machine in front of the flap-folder and adapted to swing forwardly and backwardly, devices for operating said parts and means for stamping the envelop, substantially as shown and described.

3. In a machine of the class described, a frame, a main outer casing inclosing said frame, a stamp-sheet table at the top of said frame, a main envelop-table at the front of the machine, a supplemental envelop-table arranged beneath the stamp-sheet table rearwardly of and in the same horizontal plane as the main envelop-table, a vertically-movable spring-supported envelop-flap folder arranged transversely between the supplemental and main envelop tables, a moistening-tank arranged transversely of the machine in front of the envelop-folder and adapted to swing forwardly and backwardly, means for operating said parts and for feeding an envelop through the machine, and devices for applying a stamp thereto, substantially as shown and described.

4. In a machine of the class described, a frame or support, a main outer casing inclosing said frame or support and provided with a front extension having a main envelop-table, a supplemental envelop-table arranged rearwardly of the main envelop-table within said frame, a stamp-sheet table placed over the supplemental envelop-table, a vertically-movable spring-supported envelop-folder placed transversely of the machine between the main and supplemental envelop-tables, a swinging flap-moistener placed transversely of the machine in front of the envelop-folder, devices for operating said parts, other devices for feeding an envelop through the machine, and means for applying a stamp to the envelop, substantially as shown and described.

5. In a machine of the class described, a frame or support a main outer casing inclosing said frame or support and provided with a front extension, having a main envelop-table, a supplemental table arranged within the frame or support rearwardly of and in the same plane as the main envelop-table, an envelop-chute rearwardly of the supplemental envelop-table, a stamp-sheet table arranged over the said supplemental envelop-table and said chute, a vertically-movable spring-supported flap-folder placed transversely between the main and supplemental envelop-tables, a swinging flap-moistener supported transversely of the frame or support in front of the flap-folder, feed-rollers arranged in pairs rearwardly of the flap-folder the separate members of each pair being arranged above and below the supplemental envelop-table and being in frictional contact, devices for operating the flap-moistener, the flap-folder and the feeding-rollers and means for applying a stamp to the envelop, substantially as shown and described.

6. A machine of the class described provided with a stamp-sheet table, main and supplemental envelop-tables, a flap-folder, a flap-moistening device, means for feeding an envelop through the machine devices for operating the flap-folder, means for operating the flap-moistening device, a stamp-sheet shifter, devices for cutting off a strip of stamps from the stamp-sheet, means for feeding a strip of stamps transversely of the machine and a device for cutting off a stamp from the end of said strip and applying the same to the envelop substantially as shown and described.

7. A machine of the class described provided with main and supplemental envelop-tables, arranged in the same horizontal plane, a depressible envelop-flap folder placed between said supplemental and main tables, and the upper side of which is normally above said tables and the front side of which is inclined downwardly and backwardly, a flap-moistening device mounted in front of the flap-folder and movable forwardly and backwardly, devices for operating the flap-folder, means for feeding an envelop through the machine and devices for applying a stamp to the envelop, substantially as shown and described.

8. A machine of the class described, provided with a stamp-sheet table, a main envelop-table at the front of the machine and below the stamp-sheet table, a supplemental envelop-table beneath the stamp-sheet table and in the same horizontal plane as the main envelop-table, means for feeding the envelop through the machine, devices for folding and sealing the flap of the envelop as it passes through the machine, a stamp-sheet shifter placed over the stamp-sheet table and adapted to move the stamp-sheet transversely of the machine, devices for cutting a strip of stamps from said sheet, means for moving said strip longitudinally of the machine and devices for cutting a stamp from the end of said strip and applying it to an envelop, substantially as shown and described.

9. A machine of the class described provided with a stamp-sheet table, a stamp-sheet shifter comprising a horizontal bar arranged over said table and having parallel end members; inwardly-directed fingers connected with said end members, spring-depressed pins connected with said bar and operating in connection with said fingers to hold a sheet of stamps and means for moving said shifter transversely of the stamp-sheet table, substantially as shown and described.

10. A machine of the class described provided with a stamp-sheet table, means for moving a sheet of stamps transversely of said table, devices for cutting a strip of stamps from said sheet, devices for moving said strip longitudinally of said table, a transversely-movable bar mounted at the end of said table and provided in one end with a stamp-moistening device, means for operating said bar so as to moisten the end stamp of said strip, and a vertically-movable plunger adapted to cut off said stamp and apply it to an envelop, substantially as shown and described.

11. A machine of the class described provided with a front extension having a main envelop-table at the top thereof, a shaft passing transversely through said extension below said table, said table being also provided with parallel slots or openings ranging forwardly and backwardly therein, slides mounted on said shaft and adapted to move an envelop lying on said table forwardly, means for moving said shaft forwardly and backwardly, consisting of an adjustable journal connected with the side of the extension at the front of the machine, a lever provided with a slot, through which the end of said shaft passes and in connection with said journal, and means for operating said lever, substantially as shown and described.

12. A machine of the class described, provided with a stamp-sheet table, main and supplemental envelop-tables arranged in the same horizontal plane, the supplemental envelop-table being beneath the stamp-sheet table and the main envelop-table being at the front of the machine, means for feeding the envelop through the machine over said envelop-tables, devices for moistening the flap of the envelop and sealing the same as the latter passes through the machine, means for shifting the stamp-sheet transversely of the machine, a knife arranged longitudinally over the stamp-sheet table and adapted to cut a strip of stamps from said sheet, means for operating said knife, devices for moving said strip forwardly, a transversely-movable stamp-moistening device at the front of the machine and adapted to moisten the end stamp of said strip, devices for operating said moistening device and a vertically-movable plunger adapted to cut a stamp from the end of said strip and to depress it onto an envelop, substantially as shown and described.

13. A machine of the class described, provided with a stamp-sheet table, a stamp-sheet shifter movable transversely of said table, a knife for cutting off a strip of stamps from said sheet, means for operating said knife, devices for moving the strip of stamps longitudinally of the machine, a transversely-movable moistening device at the end of the machine, means for operating said moistening device so as to moisten a stamp at the end of said strip, means for feeding an envelop through the machine beneath the stamp-sheet table, devices for folding and sealing the flap of the envelop as it is fed through the machine, and a vertically-movable plunger adapted to cut off a stamp from the end of said strip and apply the same to the envelop as it passes through the machine, substantially as shown and described.

14. A machine of the class described, provided with a stamp-sheet table, means for shifting a sheet of stamps transversely thereof, means for cutting a strip of stamps from said sheet, devices for moving said strip longitudinally of the machine comprising a lever m^7, a vertically-movable spring-depressed bar connected with said lever, transversely-arranged pins in the top of said lever and said bar, and means for operating said lever and said bar and said pins, substantially as shown and described.

15. A machine of the class described, provided with a stamp-sheet table, means for shifting a sheet of stamps transversely of said table, a knife for cutting off a strip of stamps from said sheet, and means for moving said strip longitudinally of the machine comprising a dog c^3 pivotally supported at one side of the machine, a vertically-arranged lever, a spring-depressed bar connected with said lever, inwardly-directed pins in the ends of said lever and said bar, the pin in the end of said lever being adapted to move over said dog and the pin in the end of said bar being adapted to move under said dog, a vertically-movable stamp-strip holder mounted adjacent and in front of said lever and means for operating said lever and said bar, substantially as shown and described.

16. A machine of the class described provided with main and supplemental envelop-tables arranged in the same horizontal plane, a plurality of pairs of feed-rollers, the separate members of which are arranged above and below the supplemental envelop-table and in frictional contact, one roller of each pair being also provided with a pinion, means for turning the rollers of each pair in opposite directions consisting of a rack-bar provided with two parallel members separated by a space the width of which is greater than the diameter of said pinions, and means for moving said rack-bar longitudinally and for raising and lowering the same, substantially as shown and described

17. A machine of the class described provided with a main shaft, a slotted arm connected with said shaft, a slotted lever connected with said arm, a longitudinally-movable rack-bar provided with a pin which operates in the slot of said lever, a vertically-movable plate in connection with which said rack-bar operates, links connected with said plate, crank-levers connected with said links, a slotted bar connected with said levers, a pin or journal connected with the first-named lever and operating in the slot of the last-named bar, lugs or projections connected with the opposite sides of the first-named lever, pins in connection with which said lugs or projections operate and means for operating said main shaft, substantially as shown and described.

18. A machine of the class described, provided with main and supplemental envelop-tables, a shaft mounted transversely beneath the main envelop-table and movable forwardly and backwardly, envelop-feeding devices connected with said shaft, rollers mounted in pairs above and below the supplemental envelop-table and in frictional contact, pinions connected with the corresponding rollers of the said pairs, a vertically-movable plate at one side of the machine and through which the shaft of said rollers projects, a rack-bar movable longitudinal of said plate and provided with parallel members, the space between which is wider than the diameter of said pinions, a main shaft passing transversely through the machine, devices in operative connection with said shaft, said rack-bar and said plate for moving said plate vertically and said rack-bar longitudinally, and other devices in operative connection with said shaft, and the shaft beneath the main envelop-table for moving said last-named shaft backwardly and forwardly, substantially as shown and described.

19. A machine for sealing and stamping envelops, comprising an inner frame or support, and an outer casing inclosing said frame or support and provided at the front with an extension having a main envelop-table, a supplemental envelop-table arranged within the frame or support and in the same horizontal plane as the main envelop-table, a plurality of pairs of rollers mounted transversely of the machine, the separate members of each pair being above and below the supplemental envelop-table and being in frictional contact, a vertically-movable envelop-folder placed between the main and supplemental envelop-tables and normally held above the same, a flap-folding device supported in front of said folder and movable backwardly and forwardly, devices beneath the main envelop-table for passing an envelop in the machine, and means for operating all of said devices so as to pass an envelop through the machine, substantially as shown and described.

20. A machine for sealing and stamping envelops, comprising an inner frame or support and an outer casing inclosing said frame or support and provided at the front with an extension having a main envelop-table, a supplemental envelop-table arranged within the frame or support and in the same horizontal plane as the main envelop-table, a plurality of pairs of rollers mounted transversely of the machine, the separate members of each pair being above and below the supplemental envelop-table and being in frictional contact, a vertically-movable envelop-folder placed between the main and supplemental envelop-tables and normally held above the same, a flap-moistening device supported in front of said folder and movable backwardly and forwardly, devices beneath the main envelop-table for passing an envelop in the machine, means for operating all of said devices so as to pass an envelop through the machine, and means for applying a stamp to the envelop as it passes through the machine, substantially as shown and described.

21. A machine of the class described provided with means for folding and sealing the flap of an envelop and passing said envelop through the machine, a stamp-sheet table arranged in the top portion of the machine, means for moving a sheet of stamps transversely of said table, a knife for cutting off a strip of stamps from said sheet, devices for moving said strip longitudinally of the machine, a transversely-movable bar arranged at one end of the machine and provided with stamp-moistening devices, means for operating said bar so as to moisten the end stamp of said strip, and a vertically-movable plunger for cutting off said stamp and applying it to the envelop, substantially as shown and described.

22. A machine of the class described provided at one side with a main operating-disk, a supplemental operating-disk arranged rearwardly of the main operating-disk and provided with a ratchet-wheel, a main shaft arranged rearwardly of the supplemental operating-disk and passing through the machine, a supplemental-operating-disk shaft, a main operative lever in operative connection with the main shaft, devices for connecting the main shaft with the main operating-disk, devices in operative connection with the main operating-disk for passing an envelop into the machine other devices in connection with said shaft for folding and moistening the flap of the envelop, devices in operative connection with the main shaft for passing the envelop through the machine and for sealing the flap thereof and other devices in operative connection with the main operating-disk, and the supplemental shaft for applying a stamp to the envelop, substantially as shown and described.

23. A machine of the class described provided with separate pairs of feed-rollers arranged vertically and transversely therein, a horizontal envelop-table having openings through which the separate rollers of each pair are placed in frictional contact, a vertically-movable plate at one side of the machine through which the shafts of said rollers pass, a pinion connected with the bottom roller of each pair, a longitudinal rack-bar mounted in said plate and provided with two members, the space between which is greater in width than the diameter of said pinions, devices for moving said rack-bar longitudinally of said plate and devices for moving said plate vertically, substantially as shown and described.

24. A machine of the class described provided with a main envelop-table having parallel slots formed therein, a shaft mounted beneath said table, blocks or slides connected with said shaft and provided with projections extending up through said slots or openings, and fingers connected with said blocks or slides at the top thereof and projecting beneath said table and in contact therewith, substantially as shown and described.

25. In a machine of the class described a transversely-movable

bar provided at one end with a water-receptacle, a moistening device in connection therewith telescopic tubes for supplying water to said receptacle, and means for supplying water to said tubes, substantially as shown and described.

26. A machine of the class described provided with a vertically-movable L-shaped stamp-holder, a pivotally-supported triangular plate pivoted near one corner and the opposite corners of which are provided with projections, the side edge of said plate between said projections and opposite the pivotal support being curved or segmental in form, said plate being also in operative connection with the stamp-holder, substantially as shown and described.

813,986. BOILER CONSTRUCTION. JAMES M. MCCLELLON, Everett, Mass. Filed Apr. 7, 1905. Serial No. 254,206.

Claim.—1. Two surfaces to be stayed, one of which is sectional and made up of channel-iron sections, and staying members rigid with the other surface, said staying members lying between and being secured to the flanges of the channel-iron sections.

2. Two surfaces to be stayed, both of which are sectional, and made up of channel-iron sections, the side flanges of some of the channel-iron sections extending between the two surfaces and constituting the staying members.

3. A fire-box comprising an inner shell inclosing the combustion-chamber and an outer shell, each formed of channel-iron sections secured together.

4. A fire-box comprising inner and outer shells, the inner shell having rigid therewith outwardly-extending flanges and the outer shell being composed of channel-iron sections interposed between said flanges.

5. A fire-box comprising inner and outer shells, the inner shell having rigid therewith outwardly-directed flanges extending transversely of the fire-box, and the outer shell being composed of channel-iron sections interposed between said flanges.

6. A fire-box comprising inner and outer shells, the inner shell having rigid therewith outwardly-directed flanges extending transversely of the fire-box, and the outer shell being composed of channel-iron sections interposed between said flanges, the portion of the flanges over the fire-box being perforated.

7. A fire-box comprising inner and outer shells, the inner shell having rigid therewith outwardly-directed flanges and the outer shell being composed of channel-iron sections interposed between said flanges, the compartments formed by the flanges having communication with each other.

8. A fire-box comprising inner and outer shells, and parallel staying-ribs extending from one shell to the other and secured to each.

9. A fire-box comprising inner and outer shells and parallel staying-ribs extending from one shell to the other and secured to each, said ribs dividing the space between the shells into separate compartments.

10. A fire-box comprising inner and outer shells, each formed of channel-iron sections and staying members forming part of or rigidly secured to the sections of the inner shell, said staying members also being secured to the sections of the outer shell.

11. A fire-box for a locomotive-boiler comprising inner and outer shells, the inner shell having outwardly-directed flanges and the outer shell comprising channel-iron sections interposed between said flanges, and said channel-iron sections having their flanges also directed outwardly.

12. In boiler construction, two shells or surfaces to be stayed, each of which has integral therewith flanges or ribs extending at right angles therefrom, the flanges or ribs of both shells extending in the same direction, and means to secure each flange of one shell to a flange of the other shell.

813,987. DEVICE FOR REPLANTING CORN. THOMAS S. MCMAHEN, Champaign, Ill. Filed Sept. 1, 1905. Serial No. 276,703.

Claim.—1. In a device of the kind described, the combination with a hopper, of an open side curved spout connected to said hopper and a curved member pivoted in said spout adapted to hold grain in the bottom of the spout, for the purpose described.

2. In a device of the kind described, the combination with a hopper, of an open side curved spout provided with a chamber at the top connected to said hopper, a curved strip pivoted in said spout provided with a cap at one end adapted to close said chamber, and means connected to said strip for opening or closing said chamber, for the purpose described.

3. In a device of the kind described, the combination with a hopper provided with a perforated slide, of an opened side pointed spout connected to said hopper provided with a chamber, a curved member pivoted in said spout adapted to close said chamber-spout and a spring-actuated lever connected to the member and slide, for the purpose described.

4. In a device of the kind described, the combination with a hopper provided with a perforated slide, of a spring member secured on said slide, an open spout connected to said hopper provided with a curved lower end, a strip pivoted in said spout provided with a curved lower end, and a spring-actuated lever connected to the strip and slide, for the purpose described.

5. In a device of the kind described, the combination with a hopper, of an open slide-spout connected to said hopper provided with a curved pointed lower end, a chamber formed in the top of the spout adjacent the hopper, a strip provided with a curve at one end and a cap at the other pivoted in said spout, and a spring-actuated lever connected to said strip, for the purpose described.

6. In a device of the kind described, the combination with a hopper provided with a perforated slide, a spring-guard secured over said slide, the brace secured to the bottom of the hopper, a guide-arm secured to the bottom of the hopper, of an open side curved pointed spout connected to the said hopper, provided with a chamber at its top, communicating with the hopper, a strip provided with a curve at one end, and a cap at the other end, pivoted in said spout, a lever pivoted on said brace, a link connecting said lever and slide, a spring connected to the upper end of the lever and to the hopper, and a link connecting the lever with the strip, for the purpose described.

813,988. PLOW. JOHN J. MCMANNON, Atlanta, Ga., assignor of one-half to O. W. Lintner, Ironton, Ohio. Filed May 10, 1905. Serial No. 259,721.

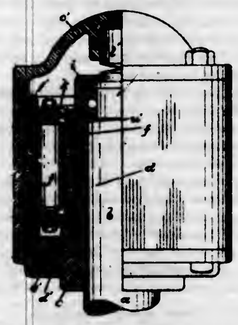
Claim.—The combination with a plow-standard comprising spaced bars connected at their lower ends, and a shovel having a squared hole therein, of a squared bolt extending between the bars, and having a hooked end extending through the hole in the shovel and behind the rear surface thereof, in contact with the said connection between the lower ends of the bars, to sustain the upward thrust on the plow.

813,989. ANTIFRICTION-BEARING. VIRTUS L. RICE, New York, N. Y. Filed Nov. 3, 1904. Serial No. 231,235.

2. A lock comprising a fixed tumbler and a plurality of movable superimposed tumblers, the fixed tumbler being formed with openings adapted to receive the securing means for securing the lock in

a glue-pot having an inclined under surface, a correspondingly-inclined supporting-surface upon which said pot rests and along which it may be slid in order to place it in or out of operative position, and

Claim.—1. An antifriction-bearing comprising an annular set of bearing-rollers, two concentric bearing parts contacting with the bearing-rollers, said bearing parts having unoccupied annular recesses at their ends, whereby the length of the operative surfaces of said bearing parts is less than the length of the operative surfaces of the bearing-rollers, and limiting means at the ends of the bearing parts, between which the bearing-rollers may move back and forth across said recesses.



2. An antifriction-bearing comprising an annular set of bearing-rollers, having central longitudinal bores with conical recesses at the ends thereof, cage-rings at the ends of the bearing-rollers, bolts passing through the longitudinal bores of the bearing-rollers to fasten the cage-rings together, antifriction-cones on the bolts on the inner sides of the cage-rings to enter the conical recesses of the bearing-rollers and between which the bearing-rollers may individually move back and forth, two concentric bearing parts contacting with bearing-rollers, said bearing parts having unoccupied annular recesses at their ends whereby the length of the operative surfaces of said bearing parts is less than the operative surfaces of the bearing-rollers, and limiting means at the ends of the bearing parts between which the bearing-rollers may move back and forth across said recesses.

3. An antifriction-bearing comprising an annular set of bearing-rollers, having beveled ends and central longitudinal bores with conical recesses at the ends thereof, cage-rings at the ends of the bearing-rollers, bolts passing through the bores of the bearing-rollers to fasten the cage-rings together, antifriction-cones on the bolts on the inner sides of the cage-rings to enter the conical recesses of the bearing-rollers and between which the bearing-rollers may individually move back and forth, two concentric bearing parts contacting with the bearing-rollers, said bearing parts having unoccupied annular recesses at their ends whereby the length of the operative surfaces of said bearing parts is less than the length of the operative surfaces of the bearing-rollers, and arresting-rings at the ends of the bearing parts having beveled faces to contact with the beveled ends of the bearing-rollers, and between which the bearing-rollers may move back and forth across said recesses.

4. An antifriction-bearing comprising two concentric bearing parts, bearing-rollers having beveled ends interposed between the bearing parts, said bearing-rollers having central conical recesses in their ends, cage-rings at the ends of the bearing-rollers, antifriction-cones connected to the cage-rings to enter said conical recesses, and spacing-cones connected to the cage-rings intermediate the antifriction-cones to contact with the beveled ends of the bearing-rollers.

5. An antifriction-bearing comprising an annular set of bearing-rollers having beveled ends, cage-rings for the bearing-rollers and spacing-cones connected to the cage-rings to engage with the beveled ends of the bearing-rollers.

6. An antifriction-bearing comprising an annular set of bearing-rollers having beveled ends, concentric annular bearing parts contacting with the bearing-rollers, cage-rings to maintain the annular formation of the bearing-rollers, spacing-cones connected to the cage-rings to contact with the beveled ends of the bearing-rollers, annular arresting-rings at the ends of the bearing parts having beveled faces to engage with the beveled ends of the bearing-rollers, and between which the bearing-rollers are collectively movable back and forth.

7. An antifriction-bearing comprising an annular set of bearing-rollers having beveled ends and central longitudinal bores with conical recesses at the ends thereof, cage-rings, bolts passing through the bores of the bearing-rollers to tie the cage-rings together, antifriction-cones on the bolts to enter the conical recesses of the bearing-rollers and so positioned as to allow the bearing-rollers to individually move back and forth between them, spacing-cones connected to the cage-rings to contact the beveled ends of the bearing-rollers, annular bearing parts contacting with the bearing-rollers, and arresting-rings at the ends of the bearing parts having beveled faces to contact with the beveled ends of the bearing-rollers and between which the bearing-rollers are collectively movable back and forth.

813,990. BUNG-BUSHING. GEORGE H. RICKE, Cincinnati, Ohio. Filed Apr. 21, 1905. Serial No. 256,603.

Claim.—1. In a bung-bushing, an annulus provided with a flange, a series of screw-threads, said screw-threads disposed at the periphery of the bush, and means between said screw-threads and the extremity of the bush for guiding and holding the same in the bung-hole to prevent tilting as and for the purposes set forth.

2. In a bung-bushing, an annulus provided with a flange, a series of screw-threads at the periphery of said annulus, disposed midway of its length, lugs, said lugs extending out from the periphery of the bush between the screw-threads and the top flange and between the screw-threads and the lower extremity of the bush, as and for the purposes set forth.

3. In a bung-bushing, an annulus provided with a flange, a series of screw-threads at the periphery of said annulus disposed midway of its length, lugs, said lugs extending out from the periphery of the bush between the screw-threads and the top flange and between the screw-threads and the lower extremity of the bush, a space provided between said lugs, the periphery of the bush and the bung-hole wall, as and for the purposes set forth.

813,991. POCKET RECEPTACLE OR HOLDER. PHILIPP SEILER, Chicago, Ill., assignor, by direct and mesne assignments, to Abram Diffenderf, Chicago, Ill. Filed Sept. 23, 1904. Serial No. 225,711.

Claim.—1. A device of the character described comprising two portions each adapted to receive articles, parts arranged to close the respective portions and each having a notched ear, a pivoted clasp member, the ends of which are adapted, when the clasp member is centrally positioned, to engage the notch of each ear and when rocked in one direction or the other to alternately release and hold the respective ears and a spring engaged with the clasp member to hold the same in central position.

2. A device of the character described comprising a frame having two receiving portions, hinged parts adapted to close the respective receiving portions, and provided with devices adapted when said parts are in closed positions to extend transversely of the frame, and a clasp member carried on the frame between said devices and having end portions normally engaged with said devices but adapted when moved to be disengaged therefrom.

813,992. COMBINATION KEYLESS LOCK. JACOB W. WAGNER and BERNARD H. PRESSENDAHL, Lansdowne, Md., assignors of one-third to Francis H. Richards, Washington, D. C. Filed Oct. 29, 1904. Serial No. 230,513.

Claim.—1. A lock comprising a plurality of tumblers, means carried by the tumblers for locking engagement with a shackle, one of said tumblers being formed with openings arranged in annular series adapted to receive a securing means for securing the lock in position.

crank lever pivoted to the tongue, a reach also pivoted to the tongue an evener pivoted to a free end of the reach also to one end of the bell-

---

813,996. MEANS FOR ELECTRICALLY CONNECTING RAILWAY-RAILS AND THE LIKE. JOHN M. ATKINSON, Chicago, Ill., as-

2. A lock comprising a fixed tumbler and a plurality of movable superimposed tumblers, the fixed tumbler being formed with openings adapted to receive the securing means for securing the lock in position, means carried by all of the tumblers for locking engagement with a shackle, the inner movable tumblers being counterparts of said fixed tumbler.

3. A lock embodying a plurality of superimposed tumblers, said tumblers carrying locking means for engagement with a shackle, said tumblers formed with central openings successively increasing in diameter, a flange overlying the outer portion of each of the said tumblers, and rings carrying said flanges and being secured to the adjacent tumbler in the rear of the respective tumblers which each flange overlies.

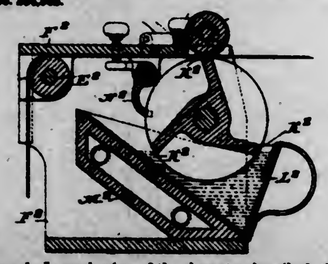
4. A lock comprising a fixed tumbler adapted to receive means for securing the lock in position, a movable tumbler mounted thereon and being a counterpart thereof, said tumblers being formed with central openings successively increasing in diameter, locking means carried by the tumblers for engagement with a shackle, and means for securing the tumblers together.

5. A lock comprising fixed and movable tumblers superimposed, each tumbler fitting into the other, said tumblers being formed with central openings successively increasing in diameter, locking means carried by the several tumblers for engagement with a shackle, and means carried by each tumbler for removably securing the succeeding tumblers thereto.

6. A lock comprising fixed and movable tumblers, fitting one into the other, each of said tumblers being formed with a tapered opening, said openings being of successively-increasing diameter in the several tumblers, a ring secured to the fixed tumbler and having a flange overlying the next movable tumbler, a ring secured to said movable tumbler and having a flange overlying the next movable tumbler, locking means carried by the several tumblers for engagement with a shackle, and a projection carried by the outer tumbler projecting beyond the outer ring.

7. A lock comprising a fixed tumbler formed with openings adapted to receive a securing means and a plurality of movable tumblers, each of said tumblers being formed with a tapered opening, said openings being of successively-increasing diameter in the several tumblers, said movable and fixed tumblers fitting one into the other, the inner movable tumblers being counterparts of the fixed tumbler, rings carried by the fixed and inner movable tumblers and being provided with flanges overlying the next outer tumbler, all of said tumblers being formed with openings and having locking-lugs projecting therefrom, the outer tumblers having a portion projecting beyond the outer ring, and securing means passing through the said fixed and inner-movable tumblers from their inner faces and engaging said rings for securing same in position.

813,994. GLUE-APPLYING MECHANISM. JACOB P. WEBSTER, Barberton, Ohio, assignor to The Diamond Match Company, Chicago, Ill., a Corporation of Illinois. Original application filed June 20, 1903, Serial No. 162,070. Divided and this application filed Apr. 11, 1905. Serial No. 254,962.



Claim.—1. In mechanism of the character described, the combination of a glue-pot, and a glue-wheel having arms with peripheral glue-applying surfaces, said arms inclining outwardly and rearwardly with respect to the direction of rotation of the wheel, and said wheel being situated above the glue-pot so that the arms thereof pass through the glue in the pot.

2. In mechanism of the character described, the combination of a glue-pot having an inclined under surface, a correspondingly-inclined supporting-surface upon which said pot rests and along which it may be slid in order to place it in or out of operative position, and a glue-applying device projecting into the pot when the latter is in position for use.

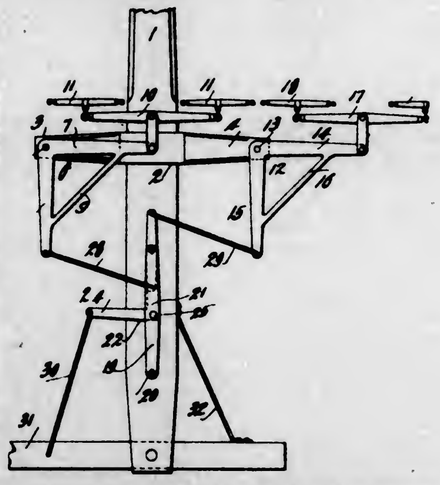
3. In mechanism of the character described, the combination of a glue-pot having an inclined under surface, a heater having a corresponding surface upon which said pot rests, and a glue-applying device projecting into the pot when the latter is in position for use.

4. In mechanism of the character described, the combination with a wheel mounted in a fixed position, of a pot or receptacle in which the lower portion of the wheel revolves, and a support for said pot or receptacle having an inclined supporting-surface that engages a like surface on the pot or receptacle.

5. In mechanism of the character described, the combination of a glue-pot having an inclined under surface, a heater having a corresponding surface upon which said pot rests, and a glue-applying wheel having a fixed axis of rotation and projecting into the pot when the latter is in position for use.

6. In mechanism of the character described, the combination of a glue-pot, a glue-wheel having arms with peripheral glue-applying surfaces, said arms inclining outwardly and rearwardly with respect to the direction of rotation of the wheel, and said wheel being situated above the glue-pot so that the arms thereof pass through the glue in the pot, and a circumferentially-grooved roller between which and the glue-wheel passes the material to receive the glue from said wheel.

813,994. DRAFT-EQUALIZER. MARION ABBY, Peoria, Ill., assignor of one-half to George P. Christensen, Bartonville, Ill. Filed June 6, 1903. Serial No. 160,574.



Claim.—1. In an equalizer, the combination with the tongue, of a bar supported by the tongue and having portions extending upon opposite sides thereof, a bell-crank lever pivotally attached to one end of the bar with its inner end extending toward the center of the said bar, a second bell-crank lever pivoted to the opposite end of the said bar with an extension of the lever extending some distance beyond the end of the bar, doubletree connections with the said levers, an evener pivoted to the tongue at a point removed to the rear of the said bar having oppositely-extended portions disposed longitudinally of the said tongue, and connecting-rods between the extensions of the evener and the opposite levers.

2. In an equalizer, the combination with a tongue, a bar supported by and transversely of the tongue, levers pivoted to the opposite ends of the bar, doubletrees attached to the said levers, a bell-crank lever pivoted to the tongue, an evener pivoted to the bell-crank, rods connecting the evener and the levers on the bar, and connections between the said bell-crank and a frame part of a suitable machine.

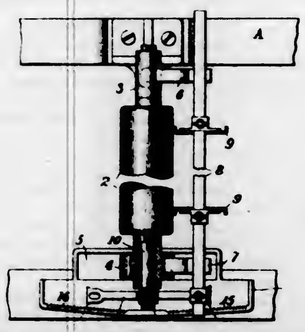
3. In an equalizer, the combination with a tongue, a bar supported by and transversely of the tongue, levers pivoted to the opposite ends of the bar, doubletrees attached to the said levers, a bell crank lever pivoted to the tongue, a reach also pivoted to the tongue an evener pivoted to a free end of the reach also to one end of the bell-crank, connections between the levers on the bar and the evener, and a connecting-rod between the bell-crank and a machine part.

4. In an equalizer, the combination with the tongue, of a bar supported by the tongue and having portions extending upon opposite sides thereof, a bell-crank lever pivotally attached to one end of the bar with its inner end extending toward the center of the said bar, a second bell-crank lever pivoted to the opposite end of the said bar with an extension of the lever extending some distance beyond the end of the bar, doubletree connections with the said levers, a reach pivoted to the tongue, a bell-crank lever pivoted to the tongue, an evener pivoted to the reach and to one end of the bell-crank, rods connecting the evener and the bell-cranks on the bar, and connections between the bell-crank on the tongue and to the frame of a suitable machine.

5. In an equalizer, the combination with the tongue, of a bar supported by the tongue and having portions extending upon opposite sides thereof, a bell-crank lever pivotally-attached to one end of the bar with its inner end extending toward the center of the said bar, a second bell-crank lever pivoted to the opposite end of the said bar with an extension of the lever extending some distance beyond the end of the bar, doubletree connections with the said levers, an evener pivotally mounted to the rear of the bar, connecting-rods between the extensions of the evener and the bell-crank levers, a member pivoted to the tongue to which the evener is pivoted and connections between the said member and a frame part of a suitable machine.

6. In an equalizer, the combination with the tongue, of a bar supported by said tongue, a pair of levers pivoted to the opposite ends of the bar, one of said levers having an extension 7 to the free end of which is attached a doubletree supporting swingletrees disposed upon opposite sides of the tongue, the right-angle extensions 8 of said lever, the second lever having the portion 14 to which is attached a doubletree supporting swingletrees, the right-angle extension 15 of said lever, an evener supported for oscillation on the tongue and longitudinally thereof, the rod 28 connecting one end of the evener with the extension 8 of the first-mentioned lever, and the rod 29 connecting the opposite end of the evener with the extension 15 of the last-mentioned lever.

813,995. AUTOMATIC APRON OR BELT GUIDE. WILLIAM J. ASHER, Willimantic, Conn. Original application filed May 12, 1903, Serial No. 156,816. Divided and this application filed Nov. 8, 1905. Serial No. 286,419.



Claim.—1. An automatic apron or belt guide comprising a roll having a swiveled bearing at one end, a crank-pin on the opposite end of the roll, a pawl-bar reciprocated by said crank-pin and adapted to rock thereon, pawls on said bar, two series of ratchet-teeth adapted to coöperate respectively with said pawls, and means controlled by the apron for rocking the pawl-bar, the said pawls being normally out of engagement with their respective ratchet-teeth.

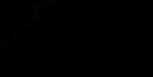
2. An automatic apron or belt guide comprising a roll having a swiveled bearing at one end, a crank-pin on the opposite end of the roll, a pawl-bar reciprocated by said crank-pin and provided with pawls at opposite ends, two series of ratchet-teeth arranged in planes at an angle to each other, and means controlled by the apron for rocking the bar upon the crank-pin to cause the pawls to engage with their respective ratchet-teeth should the apron vary from its normal path.

813,996. MEANS FOR ELECTRICALLY CONNECTING RAILWAY-RAILS AND THE LIKE. JOHN M. ATKINSON, Chicago, Ill., assignor, by mesne assignments, to The Rail Joint Company, a Corporation of New York. Filed Mar. 15, 1904. Serial No. 198,368.

Claim.—1. The improved angle-bar for connecting railway-rails, comprising an angle-bar having a shallow recess formed in a bearing of said angle-bar adapted to engage the rail, said recess containing a high conductor of electricity deposed in permanent molecular connection with the comparatively low conductive body of metal of said angle-bar.

2. The combination with the railway-rails, of angle-bars for connecting said railway-rails, said bars comprising angular, conducting-bars formed to contact with the faces of the rail-bases, the contact-bearings being recessed and containing a molecularly-adhering electrodeposit of highly-conductive metal adapted to contact with said flange of the rail, substantially as set forth.

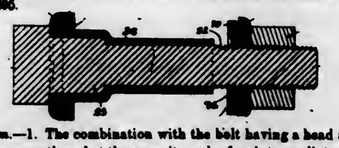
813,997. BASE ATTACHMENT FOR CENTER-GAGES. JOHN L. BALTHER and LARGY S. STARRETT, Athol, Mass., assignors to The L. S. Starrett Co., Athol, Mass., a Corporation of Massachusetts. Filed Dec. 5, 1904. Serial No. 235,493.



Claim.—1. A base or seat for a center-gage, the same comprising a rigid elongated body having in its bottom a continuous longitudinal recess with diverging walls and flattened lower edges, and formed in its top with a vertical longitudinal groove or slot immediately above the axis of said body, in combination with a spring mounted in such groove or slot, rising above the walls thereof on a uniform curve, and adapted to hold the gage or blade frictionally against the vertical wall of said groove, substantially as set forth.

2. The elongated base-block 6 having a rectangular recess 7 with radial walls flattened terminally and above it a vertical longitudinal slot 8, with spring 9 therein, anchored terminally to the base-block and adapted to hold the tool frictionally against the slot-wall, substantially as set forth.

813,998. INSULATED RAIL-JOINT. BANCROFT G. BRAINE, New York, N. Y., assignor, by mesne assignments, to The Rail Joint Company, a Corporation of New York. Filed Oct. 31, 1903. Serial No. 179,265.



Claim.—1. The combination with the bolt having a head at one end and a screw-thread at the opposite end, of an intermediate sleeve of insulation hugging said bolt, and washers at the ends of said sleeve and having recesses at the sides toward said sleeve.

2. The combination with a bolt having a reduced portion intermediate of its extremities with shoulders or stops at the ends of said reduced portion, of a split insulating-sleeve upon the reduced portion.

3. The combination with a bolt having a head at one end and a threaded portion at the other, and being reduced intermediate of said ends, of a resilient split insulating-sleeve upon said reduced portion.

4. The combination with a bolt, of an insulating-sleeve upon the shank of said bolt, and an annular portion of insulation at one end of said sleeve, projecting peripherally beyond the same, and having its side next the sleeve annularly recessed.

5. The combination with a bolt, of an insulating-sleeve upon the shank of said bolt, and a washer at the end of said sleeve having in its side adjacent to the sleeve an annular recess of greater diameter.

6. The combination with a bolt having a reduced portion inter-

mediate of its ends, an insulating-sleeve upon said reduced portion, and an annular portion of insulation at one end of said sleeve, projecting peripherally beyond the same, and having its side next the

5. In a loom, a shuttle-box, a shuttle to contain a plurality of short wefts, means to select a weft to be delivered from said shuttle,

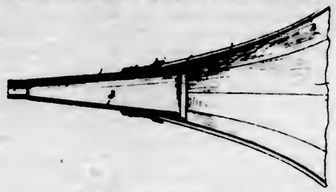
short weft, means to move said shuttle through the shed, controlling means to act upon said weft in the shed, and prevent the same from curling or getting out of position therein before the action of the reed

Claim.—1. In the generation of gas in a gas-producer, the process which consists in supplying to the draft-current an endothermic body consisting of mixed and averaged products of combustion from

mediate of its ends, an insulating-sleeve upon said reduced portion, and an annular portion of insulation at one end of said sleeve, projecting peripherally beyond the same, and having its side next the sleeve annularly recessed.

7. The combination with a bolt, of an insulating-sleeve upon the shank of said bolt and having its end next the entering end of the bolt tapered at the outer edges, and an annular portion of insulation at the other end of the sleeve, next the head of the bolt, projecting peripherally beyond the same, and having its side next the sleeve annularly recessed.

813,999. PHONOGRAPH-HORN. JAMES T. BROWN, New York, N. Y. Original application filed Dec. 24, 1904, Serial No. 238,241. Divided and this application filed June 13, 1905. Serial No. 265,085.



Claim.—1. A horn comprising a mouthpiece and a collapsible portion constructed with their inner surfaces of leather, said collapsible portion arranged to be expanded by engagement with said mouthpiece, and guards for protecting the leather inner surfaces during such engagement, substantially as described.

2. A horn comprising a mouthpiece and a collapsible portion constructed with their inner surfaces of leather, said collapsible portion arranged to be expanded and clamped in expanded position by engagement with said mouthpiece, and guards for protecting the leather inner surfaces during such engagement, substantially as described.

3. A horn comprising a mouthpiece and a collapsible portion constructed with their inner surfaces of leather, said mouthpiece arranged to telescope within the collapsible portion for expanding the latter, and guards for protecting the inner surfaces during such expansion, substantially as described.

4. A horn comprising a mouthpiece, a collapsible portion, said mouthpiece and collapsible portion constructed with their inner surfaces of leather, means carried by said mouthpiece for expanding the collapsible portion, and guard-rails carried by said collapsible portion in position for engagement by said expanding means, substantially as described.

5. A horn comprising a mouthpiece, a collapsible portion, said mouthpiece and collapsible portion constructed with their inner surfaces of leather, means carried by said mouthpiece for expanding the collapsible portion, and inclined guard-rails carried by said collapsible portion in position for engagement by said expanding means, substantially as described.

6. A horn comprising a mouthpiece, a collapsible portion, means carried by said mouthpiece for expanding the collapsible portion, and rails carried by said collapsible portion in position for engagement by said expanding means, substantially as described.

7. A horn comprising a mouthpiece, a collapsible portion, tapered means carried by said mouthpiece for expanding the collapsible portion, and inclined rails carried by said collapsible portion in position for engagement by said expanding means, substantially as described.

814,000. LOOM. ARTHUR S. COWAN, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a Corporation of Massachusetts. Filed Dec. 28, 1903. Serial No. 186,796.

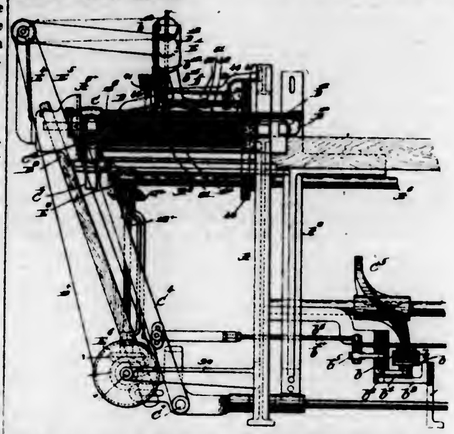
Claim.—1. In a loom, means to form sheds, a shuttle to carry a plurality of short wefts, and means to move said shuttle to leave a short weft in the shed.

2. In a loom, a shuttle adapted to carry short lengths of weft, means to select said weft singly, means to hold the selected weft, and means to move the shuttle to deliver therefrom a weft.

3. In a loom, a shuttle to contain a plurality of short wefts, weft-selecting means, and weft-holding means to engage and hold a selected weft, and means to move the shuttle while the weft-holder holds the weft.

4. In a loom, a shuttle-box, a shuttle to contain a plurality of short wefts, means to select the wefts in said shuttle, and means to move the shuttle that it may deliver therefrom weft so selected.

5. In a loom, a shuttle-box, a shuttle to contain a plurality of short wefts, means to select a weft to be delivered from said shuttle, means to engage and hold the selected weft, and means to move the shuttle to deliver said weft.



6. In a loom, a shuttle-box, a shuttle adapted to receive weft doubled on itself, and selecting means to enter the shuttle between its ends and engage and select the weft.

7. In a loom, a shuttle-box, a shuttle adapted to receive a plurality of doubled short wefts, selecting means to enter the shuttle and engage one of said short wefts near its end, and withdraw said end from the mass of short weft in the shuttle.

8. In a loom, a shuttle-box, a shuttle adapted to receive a plurality of short wefts, selecting means to enter the shuttle and engage one of said short wefts near its end, and withdraw said end from the mass of short wefts in the shuttle, and means to exert tension on the mass of short wefts in the shuttle and the single weft being drawn therefrom.

9. In a loom, a shuttle-box, a shuttle to contain a plurality of short wefts, weft-selecting devices, means to actuate said devices to select a weft, and means to arrest further movement of said devices after selecting a weft.

10. In a loom, a shuttle-box having a connected guide, weft-selecting means sustained by said shuttle-box, short-weft-holding means comprising normally closed jaws, means to move said holding means on said guide, and means to open said jaws to embrace a selected weft.

11. In a loom, shed-forming means, a shuttle to carry a plurality of short wefts, and a shuttle to carry a continuous weft, shifting shuttle-boxes to contain said shuttles, means for selecting said short wefts and for moving said shuttles as desired through the shed.

12. In a loom, a shuttle-box having a connected guide, weft-selecting means sustained by said shuttle-box, short-weft-holding means comprising normally closed jaws, means to move said holding means on said guide, means to open said jaws to embrace a selected weft, and means to then open said jaws a second time that the short weft held by it may be discharged.

13. In a loom of the class described, a guide, a shuttle to contain short weft, selecting means to select a short weft to be delivered in the shed by the shuttle, a weft-holder comprising normally closed jaws, actuated means to slide said weft-holder on said guide to engage and deliver the weft, and means for opening said holder to release the weft.

14. In a loom, a shuttle to contain a plurality of short wefts, a shuttle or shuttles to contain a continuous weft, shed-forming mechanism, shifting shuttle-boxes, picking mechanism, short-weft-selecting means, a short-weft holder, a pattern-surface, and mechanism connected with the shuttle-boxes and controlled as to its time of movement by said pattern-surface to place the shuttle-box containing the short wefts and the selecting mechanism, or the shuttle-box containing the shuttle carrying the continuous weft in operative position with relation to the race of the lay, that the loom may weave a fabric having a series of short wefts and a series of picks of continuous weft, the number of picks of short weft and of continuous weft being controlled by said pattern-surface.

15. In a loom, a short-weft-carrying shuttle, means to select a short weft, means to move said shuttle through the shed, controlling means to act upon said weft in the shed, and prevent the same from curling or getting out of position therein before the action of the reed thereon.

16. In a loom, shed-forming mechanism, a short-weft-carrying shuttle, selecting means to select the wefts singly, means to move said shuttle to deliver a short weft, and oppositely-moving devices to contact with the warps in the upper and lower planes of the shed, and cause said warps to be closed onto so as to engage and produce tension on the short weft laid in the shed preparatory to crossing the warps for the next shed and beating the weft into the fell.

17. In a loom for weaving with short wefts, a short-weft-carrying shuttle, and short-weft-selecting means adapted to select a short weft from the bunch of short wefts in said shuttle, said selecting means retaining temporarily one end of said selected short weft, and a holder to which said weft-selecting means gives up the end of said short weft.

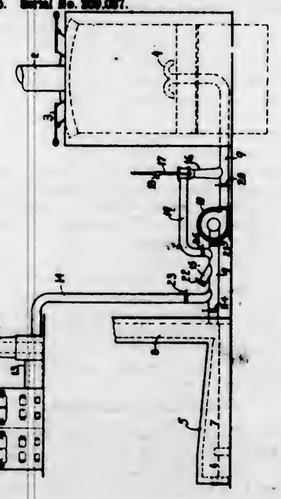
18. In a loom, a shuttle-box, a short-weft-carrying shuttle adapted to carry in a bunch of short wefts, short-weft-selecting means coacting with said short-weft-carrying shuttle, and occupying such position with relation to the shuttle-box as to enter the ends of the bunch of short wefts of said shuttle when the latter is in its shuttle-box.

19. In a loom for weaving with short weft, a shed-forming pattern-surface, means for selecting and laying the short wefts in the shed, a lay, a feeler to feel for a short weft laid in the shed, a device under the control of said feeler, and means intermediate said device and said pattern-surface whereby when a weft is absent from the shed said device will actuate said means and arrest the movement of the pattern-surface, the presence of weft in the shed rendering said device inoperative, thus permitting said means to be moved and effect the automatic starting of the pattern-surface.

20. In a loom, shed-forming mechanism, a pattern-surface, means for actuating said pattern-surface and shed-forming mechanism, means to lay weft in the shed, a lay, a feeler to feel for weft in the shed, and means intermediate said feeler and said pattern-surface, whereby when a weft is absent said pattern will be stopped.

21. In a loom, shed-forming mechanism, a drop shuttle-box, a pattern-surface, means controlled by said pattern-surface to actuate the shed-forming mechanism, means also controlled by the pattern-surface to move the shuttle-box, a device coacting with the pattern-surface to move said pattern-surface or leave it at rest, weft-feeling mechanism, and means intermediate said feeler and device coacting with said pattern-surface to stop the pattern-surface when the weft fails, and means to effect the starting of the pattern-surface when weft is supplied to the shed.

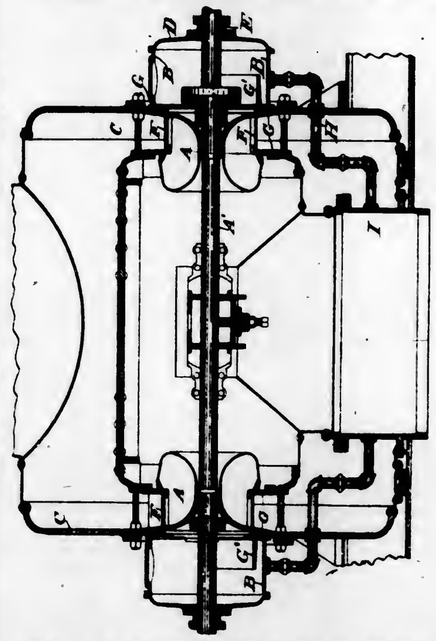
814,001. PROCESS OF GENERATING GAS. CARLETON ELLIS, New York, N. Y., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Original application filed Mar. 6, 1906, Serial No. 305,468. Divided and this application filed May 5, 1905. Serial No. 259,097.



Claim.—1. In the generation of gas in a gas-producer, the process which consists in supplying to the draft-current an endothermic body consisting of mixed and averaged products of combustion from different sources, whereby the temperature of said endothermic body may be regulated to any desired degree.

2. In the generation of gas in a gas-producer, the process which consists in supplying to the draft-current as an endothermic body, products of combustion from a furnace treating ore and admixing therewith further products of combustion from a boiler-furnace.

814,002. TURBINE-WATER-WHEEL CONSTRUCTION. ARTHUR GIESLER, Dayton, Ohio. Filed May 31, 1905. Serial No. 263,076.



Claim.—1. In a water-wheel system, a chute-case conducting the water to the wheel, a gate within said chute-case, and an extension on said chute-case reaching outwardly into the dome-cylinder, said extension being in alinement with and adapted to receive the gate when opened.

2. In a water-wheel system, a flume, a water-wheel runner housed within said flume, a chute-case within said flume, a gate within said chute-case, and a dome-cylinder connected directly to said flume on the outside thereof and into which the gate is adapted to move, and means projected outwardly from the chute-case into said dome for supporting the gate when moving into the dome-cylinder, substantially as specified.

814,008. HAMMER FOR BEATING LEAF METAL. HANS B. GRABAU, New York, N. Y. Filed May 1, 1905. Serial No. 258,946.

Claim.—1. A hammer for beating leaf metal provided with a cross-head having angular abutments, levers pivoted thereto, means for suspending a hammer-head from the levers, set-screws engaging the levers, holders engaged by the set-screws, and buffers supported by the holders and adapted to engage the abutments, substantially as specified.

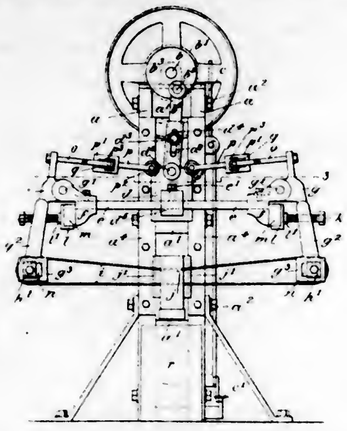
2. A hammer for beating leaf metal provided with a slidable cross-head, levers pivoted thereto, bearings slidably supported by the levers, rollers journaled in the bearings, a belt surrounding the rollers, a hammer-head suspended from the belt, and resilient buffers between the bearings and the levers, substantially as specified.

3. A hammer for beating leaf metal provided with a guideway and slidable cross-head guided thereby, levers pivoted thereto and having upwardly-extending arms, a belt connected to the lower free

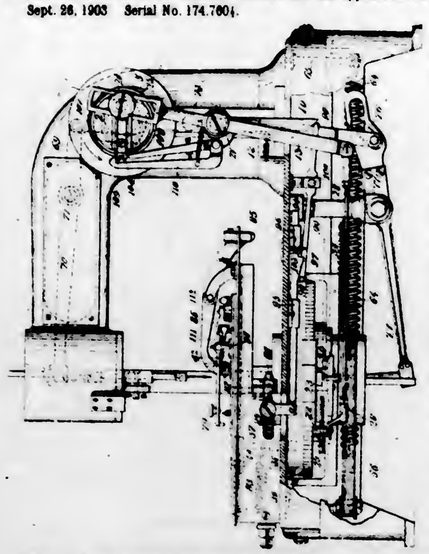
ends of the levers, a hammer-head suspended from the belt, and re-

amount of latent motive power while the machine is not in action,

ends of the levers, a hammer-head suspended from the belt, and resilient buffers between the cross-head and the upwardly-extending lever-arms, substantially as specified.



814,004. AUTOMATIC MOTORY MANUFACTURING-MACHINE. FRANK L. HARMON, Beverly, Mass. Original application filed Nov. 30, 1896. Serial No. 613,906. Divided and this application filed Sept. 26, 1903. Serial No. 174,760.



Claim —1. An automatic motory manufacturing-machine made for the special purpose of producing a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and which comprises means for holding a proper amount of latent motive power while the machine is not in action, and means whereupon a proper amount of power may be generated at each operation of the machine, and means whereupon all the power that is generated in one operation of the machine may be released and utilized as motive power in one operation of the machine, and means adapted to be forced by said power to produce a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon.

2. An automatic motory manufacturing-machine made for the special purpose of producing a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and which comprises means for holding a proper amount of latent motive power while the machine is not in action, and means whereupon a proper amount of power may be generated at each operation of the machine, and means whereupon all the power that is generated in one operation of the machine, and means whereupon the power that is generated in one operation of the machine may be released and utilized as motive power in one operation of the machine, and a support upon which a material may be held, and means for the purpose of being forced by the power released and utilized to produce a predeterminate manufacturing operation upon said material on said support and then to cease operating thereon.

3. An automatic motory manufacturing-machine made for the special purpose of producing a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and which comprises means for holding a proper amount of latent motive power while the machine is not in action, and means whereupon power may be released and utilized, and means for the purpose of being forced by power released and utilized to produce a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and means having another power connected therewith to be employed, and means to be driven by the power released and utilized to automatically employ the power to be employed, and means adapted to be forced by the power to be employed to automatically generate the aforesaid power which is held latent to be released and utilized, and means whereupon the power thus employed is automatically disemployed when enough power is generated.

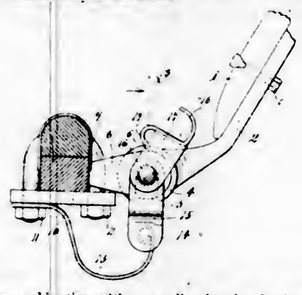
4. An automatic motory manufacturing-machine made for the special purpose of producing a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and which comprises means for holding a proper amount of latent motive power while the machine is not in action, and means whereupon power may be released and utilized, and means for the purpose of being forced by power released and utilized to produce a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and means having another power connected therewith to be employed, and means whereupon the power to be employed may be employed, and means forced by the employed power to automatically generate the aforesaid power which is held latent to be released and utilized, and means operated by the released power to cause the generating of power to automatically cease when enough power is generated.

5. An automatic motory manufacturing-machine made for the special purpose of producing a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and which comprises means for holding a proper amount of latent motive power while the machine is not in action, and means whereupon power may be released and utilized, and means for the purpose of being forced by power released and utilized to produce a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and means having another power connected therewith to be employed, and means whereupon the power to be employed may be employed, and means to be forced by the employed power to automatically generate the aforesaid power which is held latent to be released and utilized, and means whereupon the power that is employed is automatically disemployed when enough power is generated.

6. An automatic motory manufacturing-machine made for the special purpose of producing a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and which comprises means for holding a proper amount of latent motive power while the machine is not in action, and means whereupon power may be released and utilized, and means for the purpose of being forced by power released and utilized to produce a predeterminate manufacturing operation upon a material held upon a support and then to cease operating thereon, and means having another power connected therewith to be employed, and means whereupon the power to be employed may be employed, and means forced by the employed power to automatically generate the proper amount of power which is held latent to be released and utilized, and means to be forced by the employed power to continue the operation of the machine upon the material, and means for automatically disemploying the employed power after the operation is finished upon the material and enough power is generated, whereupon the machine ceases its operation.

814,005. THILL-COUPLING. JOSEPH L. HENRY, Rochester, N. Y. Filed Feb. 20, 1905. Serial No. 246,367.

Claim.—1. The combination with a coupling-bracket having laterally-spaced ears and a pivot-bolt extending between said ears, of a pair of laterally-spaced straps yieldingly supported at their lower ends, a lock-piece embracing the ears of said bracket, and pivotally connected to said straps in line with said pivot-bolt, and provided with a lock-foot, and a detachable member having a head formed with an open seat adapted to engage the pivot-bolt of said coupling-bracket, and which lock-foot is adapted to engage the head of said detachable member to hold the same interlocked with said lock-bolt, substantially as described.



2. The combination with a coupling-bracket having laterally-spaced ears and an endwise-removable bolt seated in said ears, of a leaf-spring secured at one end with respect to said bracket, laterally-spaced straps connected to the free end of said spring and embracing the ears of said bracket, a yoke-like lock-piece pivoted to the ends of said straps and having a lock-foot, and a detachable member having a head formed with an open seat and with a lock-notch, which open seat is adapted to engage the bolt of said coupling-bracket, and which lock-notch is adapted to be engaged by the foot of said lock-piece, substantially as described.

3. The combination with a coupling-bracket having laterally-spaced ears and an endwise-removable bolt seated in said ears, of a leaf-spring secured at one end with respect to said bracket, laterally-spaced straps pivotally connected to the free end of said spring, with their upper ends embracing, and yieldingly held with respect to, the ears of said bracket, a yoke-like lock-piece, pivotally connected to the upper ends of said straps and having a lock-foot, and a headed member having an open seat and a lock-notch, which seat is engageable with the bolt of said bracket, and which lock-notch is adapted to be engaged by the foot of said lock-piece, substantially as described.

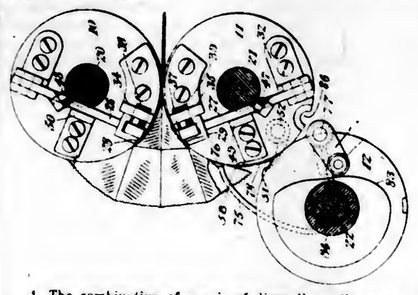
4. The combination with a coupling-bracket 8 having perforated ears, of a bolt 12 seated in said ears and extending less than completely through said ears, the spring 13 anchored at one end with respect to said bracket, the straps 15 pivotally connected to the free end of said spring and embracing the ears of said bracket, the yoke-like lock-piece 17 embracing the ears of bracket and provided with a finger-piece 18 and a lock-foot 19, rivets 16 pivotally connecting the prongs of said lock-piece to the upper ends of straps 15, with their inner heads yieldingly held in engagement with the perforations in the ears of said bracket 8, and the member 2, having a head 4 formed with open seat 5 and lock-notch 6, which seat is engageable with said bolt 12, and which notch is adapted to be engaged by the foot of said lock-piece, substantially as described.

814,006. PAPER-BAG MACHINE. WILLIAM LIDDELL, Brooklyn, N. Y., assignor to Continental Paper Bag Company, a Corporation of Maine. Filed Sept. 2, 1904. Serial No. 223,143.

Claim.—1. The combination of a folding-roll, a lever substantially radial to the roll pivoted at each end of the roll, a side clip mounted in the free end of each lever, means for oscillating the levers toward and away from the roll and means for raising and lowering said levers in the plane of their length all combined and operating together substantially as described.

2. The combination of a pair of distending-rolls, side clips oppositely disposed on opposite ends of each thereof respectively, means for moving the side clips into and out of engagement with their respective rolls and means for retracting said side clips radially to positions below the faces of the rolls respectively, all combined and operating together substantially as described.

3. The combination of a roll, a lever, pivotally mounted at each end thereof, a side clip mounted in the free end of each lever, means to oscillate the levers lengthwise of the rolls and means to raise and lower the side clips both in their inward and outward positions substantially radially of the rolls, all combined and operating together substantially as described.



4. The combination of a pair of distending-rolls, means for holding the upper and lower plies of the forward end of a bag-blank thereto respectively, a lever substantially radial to its respective roll, pivotally mounted at each end of each of said rolls, a side clip, mounted in the free end of each of said levers, means to oscillate the levers longitudinally of the rolls and means to raise and lower the side clips substantially radially of the rolls respectively, all combined and operating together substantially as described.

5. The combination of a roll, a bar 63 therein, reciprocatable inwardly and outwardly with respect of the periphery of the roll, cams 64 for reciprocating the bar, a lever 270 pivotally mounted in each end of the bar, a side clip 290 carried by each lever and cams 43 for oscillating the levers toward and from the roll, all combined and operating together substantially as described.

6. The combination of a folding-roll, side clips mounted on said roll for reciprocation approximately radial thereto, means to reciprocate the side clips, and means for moving said side clips longitudinally of said roll in a plane radial thereto in coaction with said reciprocation, all combined and operating together substantially as described.

7. The combination of a folding-roll, side clips and a front clip thereon, a revoluble carrier 12, a supplemental front finger pivotally mounted in said carrier, means for revolving the carrier in time with the roll and for swinging said finger inwardly and outwardly of said carrier for coöperation with the folding-roll, all combined and operating together substantially as described.

8. The combination of a folding-roll, side clips and a front clip thereon, ironing-roll 12, supplemental front finger 75 pivoted therein, means, comprising arm 81 and cam 83 for swinging said finger inwardly and outwardly of the ironing-roll for coöperation with the folding-roll, and means for timing the ironing-roll with the folding-roll, all combined and operating together substantially as described.

9. The combination of a distending-cylinder, means to grip a bag-blank thereto a rotatable carrier adjacent to the distending-cylinder, a supplemental front finger eccentrically pivoted in the rotatable carrier, means for operating said finger for engagement with the bag-blank to prevent tearing in forming the diamond fold, all combined and operating together substantially as described.

10. The combination of a revoluble folding-bed 96, means for holding a bag-blank thereon, a revoluble pasting-wheel 14, a stripping-finger 105 mounted in said wheel for movement inwardly and outwardly thereof for coaction with the folding-bed, means to actuate the stripping-finger and means for timing the pasting-wheel and the folding-bed, all combined and operating together substantially as described.

11. The combination of a folding-roll, a lever substantially radial to the roll pivoted at each end of the roll, a side clip in the free end of each lever, means for oscillating the levers toward and away from the roll and means for raising and lowering the side clips radial to the roll all combined and operating together substantially as described.

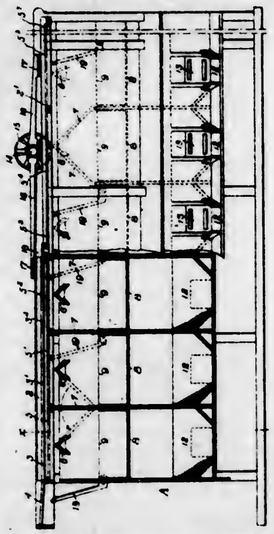
REISSUES.

12,459. FRUIT-GRADER. WILLIAM C. ANDERSON, San Jose, Cal., assignor, by mesne assignments, to Anderson-Barngrover Mfg. Co., San Jose, Cal., a Corporation of California. Filed June 16, 1904. Serial No. 212,908. Original No. 703,887, dated July 1, 1902.

Claim.—1. In an apparatus for grading prunes, the combina-

tion of two series of perforated screens, a shorter upper series, and a

tion of two series of perforated screens, a shorter upper series, and a longer lower one, the screens in each series having perforations increasing in size from the receiving end of the machine and the screens in the upper series adapted to deliver the fruit simultaneously upon an equal number of the lower screens, whose perforations also increase from the head end of the machine, said last-named screen having its perforations smaller than the perforations in the screen immediately above it, and means whereby the screens are given a longitudinal shaking movement.



2. In an apparatus for grading prunes, the combination of two series of screens, an upper series and a longer lower and parallel series, said screens in each series having perforations of smallest diameter in the screen nearest the feed end of the apparatus, the perforations in the succeeding screen of successive large diameters, the perforations in the upper screens relatively larger than the perforations in the screens immediately beneath, and means whereby the fruit is made to travel over these screens.

3. In an apparatus for grading prunes, the combination of two series of screens, one above the other the uppermost having perforations of smallest diameter in the screen at the head of the machine and gradually increasing in size through the remaining screens, said screens adapted to pass successively two or more grades of fruit therethrough, a second series of screens beneath the upper series, having perforations of smallest diameter in the screen at the head of the machine, and gradually increasing in size through the remaining screens said screens adapted to pass successively but a single grade of fruit therethrough, and means by which these screens are given a longitudinally-shaking movement.

4. The combination in a fruit grading and classifying apparatus of grading-screens and blending means centrally below the same consisting of divergent transversely-disposed surfaces beneath the screens, and hinged coacting dividers interposed between adjacent blending means by which varying proportions of the product of adjacent screens may be mingled or diverted.

5. In a prune-grading apparatus, the combination of a plurality of horizontal perforated screens in line and forming an upper series, a second longer series of perforated screens below and parallel with and extending beyond the first series, said lower screens arranged in line with each other, the perforations in the screens in each series increasing in diameter from the receiving to the opposite end, the perforations in the upper series relatively larger and varying in wider proportion than the perforations in the lower screens, frames within which these two series are secured, a shaft centrally disposed of these frames and connections with the frame upon either side of the shaft whereby the frames are reciprocated.

6. An apparatus for grading and classifying prunes, consisting of two series of horizontally-disposed contiguous shaking-screens having perforations of gradually-increasing diameter from the commencement to the discharge end, said series consisting of a shorter upper one and a longer lower one, the screens in the upper series having perforations relatively larger than the perforations in the lower screens, roof-like sections transverse to, beneath and central of each of the lower screens, and dividers by which the product of any screen or any proportion of said product may be mingled with the discharge from adjacent screens.

7. The combination in an apparatus for grading and classifying prunes of a shorter upper and a longer lower series of approximately horizontal shaking-screens, with perforations of different sizes and increasing in diameter from the receiving to the opposite end, the screens in the upper series adapted to deliver the fruit simultaneously upon an equal number of the lower series, double inclined roof-like sections located transversely beneath the central portions of the lower screens, transverse sections hinged in line beneath the meeting edges of the screens, and turnable to divert a portion of the discharge of contiguous screens to either side, a longitudinally-disposed partition centrally located beneath said grading-sections, and sections hinged to its upper edge and turnable to divert the fruit to discharge upon either side of the apparatus.

8. The combination in a fruit grading and classifying apparatus, of grading-screens, fixed divergent, transversely-disposed surfaces located beneath the screens intermediate of their ends, and boards hinged in line beneath the junction of contiguous screens and turnable to form continuations of the divergent surfaces beneath either of said screens.

9. The combination in a fruit grading and classifying apparatus, of grading-screens, transverse downwardly-divergent surfaces fixed beneath the screens intermediate of their ends, transverse boards having their lower edges turnably supported approximately in planes below the junction of contiguous screens, whereby the upper edges may approach and form continuations with the divergent surfaces upon either side.

10. The combination in a fruit grading and classifying apparatus of grading-screens, fixed, downwardly-divergent, transversely-disposed surfaces centrally beneath the screens, transversely-hinged dividers coacting with said surfaces to mingle or divert the products of contiguous screens, longitudinally-divided bins, and longitudinally-hinged tilting boards, turnable to receive the blended product and divert it to the bins on either side.

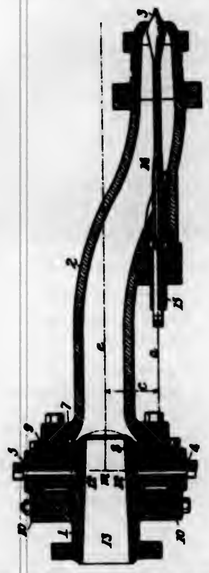
11. In an apparatus for grading fruit two sets of horizontal perforated screens, consisting of an upper shorter set, and a lower longer set parallel with the upper set and having perforations increasing in diameter from the receiving to the discharging end, said lower set comprising two separate sections in line with each other but having an intervening space between adjacent ends, a flap or apron connecting the adjacent ends of said two sections whereby a continuous travel of fruit is effected, a rigid connection between the first section of the lower set and the upper set of screens and means for reciprocating both sets of screens.

12. In an apparatus for grading fruits, two sets of perforated screens consisting of an upper, shorter set, a longer lower set substantially parallel with the upper set and having perforations increasing in diameter from the receiving to the discharging end, said lower set comprising two separate sections in line with each other but having an intervening space between adjacent ends, a flap or apron connecting the adjacent ends of said two sections, whereby a continuous travel of fruit is effected, a connection between the first section of the lower set and the upper set of screens adapted to impart movement from one to the other, and means for reciprocating both sets of screens.

13. In an apparatus for grading fruits, two sets of perforated screens consisting of an upper, shorter set, a longer lower set substantially parallel with the upper set and having perforations increasing in diameter from the receiving to the discharging end, said lower set comprising two separate sections in line with each other but having an intervening space between adjacent ends, a flap or apron connecting the adjacent ends of said two sections, whereby a continuous travel of fruit is effected, and means for reciprocating both sets of screens and simultaneously reciprocating said first section of the lower set and said upper set of screens.

12,460. **NOZZLE FOR IMPACT WATER-WHEELS.** WILLIAM A. DOBLE, San Francisco, Cal. Filed Feb. 17, 1904. Serial No. 194,103. Original No. 751,720, dated Feb. 9, 1904.

Claim.—1. A hydraulic apparatus consisting of an impact-wheel with buckets, a nozzle-pipe of sinuous or double-curved form for directing a stream of water upon the buckets of said wheel, means for varying the amount of water discharged from said nozzle, and a supply-pipe to which said nozzle-pipe is pivoted on an axis in the plane of its sinuosity, said plane and axis being substantially parallel to the axis of the said impact-wheel, substantially as specified.



2. A hydraulic apparatus consisting of an impact-wheel, a nozzle rigid throughout, of curved form, for directing a stream upon said wheel, means for varying the amount of discharge from the tip of the nozzle, a supply-pipe, and a pivot connecting the nozzle and pipe, the axis of the pivot at right angles to the direction of flow at the axial point and located in the plane of the bend of the nozzle.

3. A hydraulic apparatus consisting of an impact-wheel, a nozzle rigid throughout and of curved form for directing a stream upon said wheel, means for varying the amount of discharge from the tip of the nozzle, a supply-pipe, and a pivot connecting the nozzle and pipe, the axis of movement of the nozzle being at right angles to the direction of flow at the axial point and located in the plane of the bend of the nozzle.

4. In a hydraulic apparatus for an impact-wheel provided with buckets and in which a jet from a pivoted nozzle is projected against the buckets in a plane perpendicular to the vertical plane of the axis of the wheel, the combination with a fluid-supply pipe, of a nozzle pivotally mounted at two diametrically opposite points outside the bore of said supply-pipe, said nozzle being bent or curved forward of the supply-pipe in the same plane as that occupied by its said pivoted points, and means arranged forward of said pivotal points for regulating the jet discharged by the nozzle.

5. In a hydraulic apparatus in which a bent rigid nozzle is provided with a valve regulating the discharge at the tip, the combination with said nozzle and valve, and with a main supply-pipe, of a pivot connecting the nozzle and pipe and located at right angles to the direction of flow at the axial point and in the plane of the bend of the nozzle.

6. A hydraulic apparatus consisting of an impact-wheel, a nozzle of sinuous or double-curved form for directing a stream upon the wheel, means for varying the amount of discharge from the nozzle, and a supply-pipe to which said nozzle is pivoted on an axis in the plane of its sinuosity, said plane and axis being substantially parallel to the axis of the said impact-wheel.

7. A hydraulic apparatus consisting of an impact-wheel, a nozzle rigid throughout, of curved form, for directing a stream upon said wheel, means for varying the amount of discharge from the tip of the nozzle, a supply-pipe, and a pivot connecting the nozzle and pipe, the axis of the pivot at right angles to the direction of flow at the axial point and located in the plane of the bend of the nozzle, and said plane parallel to that of the axis of the wheel.

8. A hydraulic apparatus consisting of an impact-wheel, a nozzle of sinuous or double-curved form for directing a stream upon said wheel, means for varying the amount of discharge from the nozzle, and a supply-pipe with which the nozzle has pivotal relation, the axis of movement of the nozzle located in the plane of the sinuosity of the nozzle.

12,461. **GAME APPARATUS.** EUGENE FAEL, St. Louis, Mo. Filed Aug. 30, 1905. Serial No. 276,452. Original No. 767,161, dated Apr. 11, 1905.

Claim—1. In a game apparatus, a board, means forming a semicircular surface leading upwardly and forwardly from the rear end of the board, and pins pivotally mounted and having wings extending below the upper end of the semicircular surface; substantially as described.

2. In a game apparatus, a board, a semicircular surface extending upwardly and forwardly from the end of the board, a baffle-plate in front of and below the upper end of the semicircular surface, and pins pivotally mounted, with wings extending below the upper end of the semicircular surface; substantially as described.

3. In a game apparatus, a board, a semicircular surface extending upwardly from the rear end of the board, grooves extending along the sides of the board, a baffle-plate in front of and below the upper end of the semicircular surface, and guide-strips upon the baffle-plate; substantially as described.

4. In a game apparatus, the rectangular block 6 having the semicircular forward faces 7, the spacing-blocks 8 between the blocks 6, the projections 9 at the forward upper ends of the blocks 8, the pins 20 pivoted to the upper forward corners of the blocks 6; and the wings 22 extending downwardly from the pins 20; substantially as described.

5. In a game apparatus, the rectangular block 6 having the semicircular faces 7, the spacing-blocks 8 between the blocks 6, the projections 9 at the forward upper ends of the blocks 8, the pins 20 pivoted to the upper forward corners of the blocks 6, the wings 22 extending downwardly from the pins 20, the baffle-plate 24 attached to the projections 9, and the guide-strips 25 and 26 secured to the baffle-plate; substantially as described.

6. In a game apparatus, a ball-surface having a flat level portion, and having a curved portion extending upwardly from the rear end of the flat portion and discharging forwardly, a baffle-plate to catch the ball from the upper part of the curved portion and discharging it back to the lower part and sides of the curved portion, a groove upon each side of the ball-surface to conduct the ball back to the player, and ride boards to hold the ball upon the ball-surface; substantially as described.

7. In a game apparatus, the combination with an alley having a horizontal portion and an upwardly-extending reflex curved portion, a baffle-plate upon which the ball is delivered after it leaves the upper

forward extremity of said curved portion, means on said baffle-plate for directing the ball to one side thereof, and a trough or channel for

37,849.

37,852. **CLOCK-CASE.** ALBERT T. FISCHER, Cleveland, Ohio. Filed

37,856. **LANTERN.** JACOB LOSLI, Portland, Oreg. Filed Aug. 16,

forward extremity of said curved portion, means on said baffle-plate for directing the ball to one side thereof, and a trough or channel for receiving the ball after it leaves the baffle-plate and returning it to the forward end of the alley; substantially as described.

8. In a game apparatus, the combination with the horizontal portion of an alley, an upwardly-extending reflex curved portion connected to the rear end of said horizontal portion, pins, means for displacing said pins by a ball delivered onto the horizontal portion of the alley, a rearwardly-inclined baffle-plate in advance of the upper forward extremity of the reflex curved portion of the alley, said baffle-plate receiving the ball, and means for directing the ball to one side of the baffle-plate as it rolls down the incline thereof and for conducting the ball back to the front end of the alley; substantially as described.

9. In a game apparatus, the combination of an alley having a horizontal portion and an upwardly-extending reflex curved portion connected to the rear end of said horizontal portion, a rearwardly-inclined baffle-plate arranged above the rear end of the horizontal portion of the alley and below the upper extremity of the curved portion thereof, whereby a ball leaving said curved portion will be delivered upon said inclined baffle-plate, and means for conducting the ball from said inclined baffle-plate to the forward end of the alley; substantially as described.

10. In a game apparatus, the combination of an alley having a horizontal portion and an upwardly-extending reflex curved portion connected to the rear end of said horizontal portion, a rearwardly-inclined baffle-plate arranged above the rear end of the horizontal portion of the alley and below the upper extremity of the curved portion thereof, whereby a ball leaving said curved portion will be delivered upon said inclined baffle-plate, and means for conducting the ball from said inclined baffle-plate to a trough substantially on the same plane as the horizontal portion of the alley and which leads to the forward end of the alley; substantially as described.

11. In a game apparatus, the combination with an alley having a horizontal portion and an upwardly-extending reflex curved portion at the rear end of said horizontal portion, a pin pivotally mounted upon the upper forward end of said curved portion, and means extending into the path of a ball and designed to be struck by a ball, whereby when the ball strikes said means said pin is swung on its pivot; substantially as described.

12. In a game apparatus, the combination with an alley having a horizontal portion and an upwardly-extending reflex curved portion at the rear end of said horizontal portion, a series of pins pivotally mounted upon a suitable support, and means extending into the paths of balls and designed to be struck by a ball, whereby when said means are struck by the ball said pins are swung on their pivots; substantially as described.

13. In a game apparatus, the combination with an alley having a horizontal portion and an upwardly-extending reflex curved portion at the rear end of said horizontal portion, pins pivotally mounted upon a suitable support, means extending below the upper end of said reflex curved portion and designed to be struck by a ball, whereby said pins are swung on their pivots, and a baffle-plate arranged below said means for receiving the ball and directing it laterally to a return-trough; substantially as described.

DESIGNS.

37,848. RING. GEORGE B. BURNS, Central Falls, R. I. Filed Jan. 23, 1906. Serial No. 297,574. Term of patent 7 years.

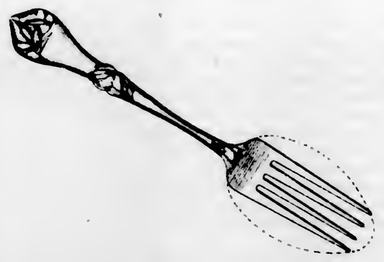
Claim.—The ornamental design for ring, as shown.

37,849. BACK FOR BRUSHES, MIRRORS, OR SIMILAR ARTICLES. HERBERT J. STRAHM, North Attleboro, Mass., assignor to Webster Company, a Corporation of Rhode Island. Filed Jan. 2, 1906. Serial No. 294,326. Term of patent 3½ years.

37,849.

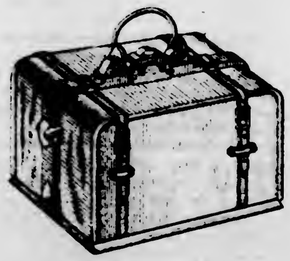
Claim.—The ornamental design for a back for brushes, mirrors, or similar articles as shown.

37,850. HANDLE FOR FORKS, SPOONS, AND SIMILAR ARTICLES. SIDNEY SMITH, Bridgeport, Conn. Filed Dec. 30, 1905. Serial No. 294,021. Term of patent 7 years.



Claim.—The ornamental design for a handle for forks, spoons and similar articles, as shown.

37,851. GLASS RECEPTACLE. GEORGE R. WEST, Pittsburg, Pa. Filed Oct. 23, 1905. Serial No. 284,112. Term of patent 3½ years.



Claim.—The ornamental design for a glass receptacle, as shown.

37,852. CLOCK-CASE. ALBERT T. FISCHER, Cleveland, Ohio. Filed Jan. 8, 1906. Serial No. 295,190. Term of patent 7 years.

Claim.—The ornamental design for a clock-case, as shown.

37,853. CLOCK-CASE. ALBERT T. FISCHER, Cleveland, Ohio. Filed Jan. 8, 1906. Serial No. 295,191. Term of patent 7 years.

Claim.—The ornamental design for a clock-case, as shown.

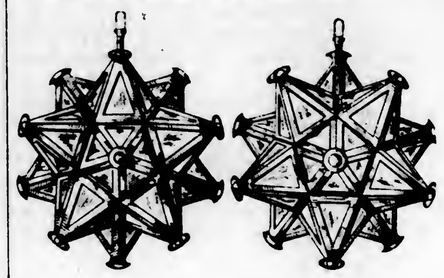
37,854. MUSIC-INDICATOR. JAMES MACMASTER, Dallas, Tex., assignor to International Conservatory of Music, Dallas, Tex., a Corporation of Texas. Filed Dec. 5, 1905. Serial No. 290,488. Term of patent 14 years.

Claim.—The ornamental design for a music-indicator, as shown.

37,855. PENCIL. EBERHARD FABER, New York, N. Y. Filed July 31, 1905. Serial No. 272,136. Term of patent 7 years.

Claim.—The ornamental design for a pencil, as shown.

37,856. LANTERN. JACOB LOSLI, Portland, Oreg. Filed Aug. 16, 1905. Serial No. 274,606. Term of patent 14 years.

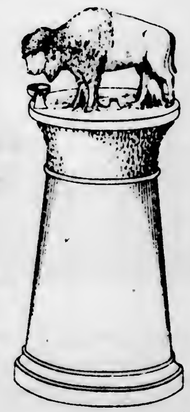


Claim.—The ornamental design for a lantern as herein shown.

37,857. CASE FOR VENDING-MACHINES. HENRY C. TRAUTE, New York, N. Y. Filed Jan. 15, 1906. Serial No. 296,223. Term of patent 7 years.

Claim.—The ornamental design for a case for a vending-machine as shown.

37,858. CASE FOR VENDING-MACHINES. HENRY C. TRAUTE, New York, N. Y. Filed Jan. 15, 1906. Serial No. 296,224. Term of patent 7 years.



forward extremity of said curved portion, means on said baffle-plate for directing the ball to one side thereof, and a trough or channel for receiving the ball after it leaves the baffle-plate and returning it to the forward end of the alley; substantially as described.

8. In a game apparatus, the combination with the horizontal portion of an alley, an upwardly-extending reflex curved portion connected to the rear end of said horizontal portion, pins, means for displacing said pins by a ball delivered onto the horizontal portion of the alley, a rearwardly-inclined baffle-plate in advance of the upper forward extremity of the reflex curved portion of the alley, said baffle-plate receiving the ball, and means for directing the ball to one side of the baffle-plate as it rolls down the incline thereof and for conducting the ball back to the front end of the alley; substantially as described.

9. In a game apparatus, the combination of an alley having a horizontal portion and an upwardly-extending reflex curved portion connected to the rear end of said horizontal portion, a rearwardly-inclined baffle-plate arranged above the rear end of the horizontal portion of the alley and below the upper extremity of the curved portion thereof, whereby a ball leaving said curved portion will be delivered upon said inclined baffle-plate, and means for conducting the ball from said inclined baffle-plate to the forward end of the alley; substantially as described.

10. In a game apparatus, the combination of an alley having a horizontal portion and an upwardly-extending reflex curved portion connected to the rear end of said horizontal portion, a rearwardly-inclined baffle-plate arranged above the rear end of the horizontal portion of the alley and below the upper extremity of the curved portion thereof, whereby a ball leaving said curved portion will be delivered upon said inclined baffle-plate, and means for conducting the ball from said inclined baffle-plate to a trough substantially on the same plane as the horizontal portion of the alley and which leads to the forward end of the alley; substantially as described.

11. In a game apparatus, the combination with an alley having a horizontal portion and an upwardly-extending reflex curved portion at the rear end of said horizontal portion, a pin pivotally mounted upon the upper forward end of said curved portion, and means extending into the path of a ball and designed to be struck by a ball, whereby when the ball strikes said means said pin is swung on its pivot; substantially as described.

12. In a game apparatus, the combination with an alley having a horizontal portion and an upwardly-extending reflex curved portion at the rear end of said horizontal portion, a series of pins pivotally mounted upon a suitable support, and means extending into the paths of balls and designed to be struck by a ball, whereby when said means are struck by the ball said pins are swung on their pivots; substantially as described.

13. In a game apparatus, the combination with an alley having a horizontal portion and an upwardly-extending reflex curved portion at the rear end of said horizontal portion, pins pivotally mounted upon a suitable support, means extending below the upper end of said reflex curved portion and designed to be struck by a ball, whereby said pins are swung on their pivots, and a baffle-plate arranged below said means for receiving the ball and directing it laterally to a return-trough; substantially as described.

DESIGNS.

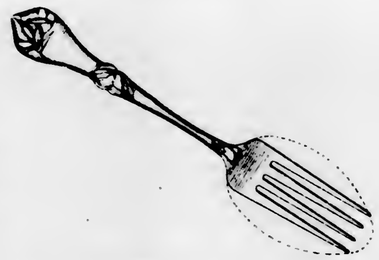
37,848. RING. GEORGE B. BURNS, Central Falls, R. I. Filed Jan. 22, 1906. Serial No. 297,574. Term of patent 7 years.

Claim.—The ornamental design for ring, as shown.

37,849. BACK FOR BRUSHES, MIRRORS, OR SIMILAR ARTICLES. HERBERT J. STRAKER, North Attleboro, Mass., assignor to Webster Company, a Corporation of Rhode Island. Filed Jan. 2, 1906. Serial No. 294,326. Term of patent 3½ years.

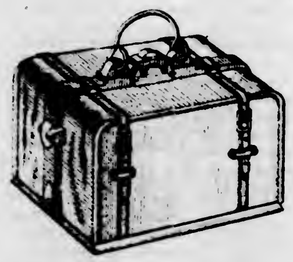
Claim.—The ornamental design for a back for brushes, mirrors, or similar articles as shown.

37,850. HANDLE FOR FORKS, SPOONS, AND SIMILAR ARTICLES. SIDNEY SMITH, Bridgeport, Conn. Filed Dec. 30, 1905. Serial No. 294,021. Term of patent 7 years.



Claim.—The ornamental design for a handle for forks, spoons and similar articles, as shown.

37,851. GLASS RECEPTACLE. GEORGE R. WEST, Pittsburg, Pa. Filed Oct. 23, 1905. Serial No. 284,112. Term of patent 3½ years.

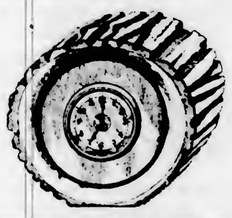


Claim.—The ornamental design for a glass receptacle, as shown.

37,852. CLOCK-CASE. ALBERT T. FISCHER, Cleveland, Ohio. Filed Jan. 8, 1906. Serial No. 295,190. Term of patent 7 years.

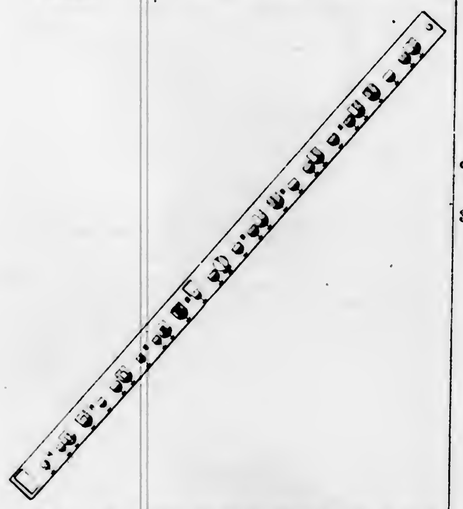
Claim.—The ornamental design for a clock-case, as shown.

37,853. CLOCK-CASE. ALBERT T. FISCHER, Cleveland, Ohio. Filed Jan. 8, 1906. Serial No. 295,191. Term of patent 7 years.



Claim.—The ornamental design for a clock-case, as shown.

37,854. MUSIC-INDICATOR. JAMES MACMASTER, Dallas, Tex., assignor to International Conservatory of Music, Dallas, Tex., a Corporation of Texas. Filed Dec. 5, 1905. Serial No. 290,458. Term of patent 14 years.

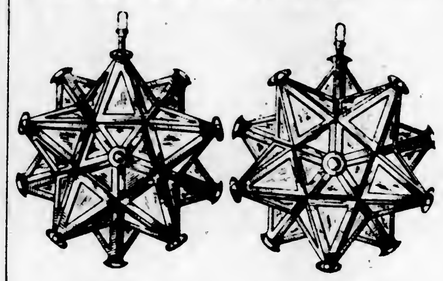


Claim.—The ornamental design for a music-indicator, as shown.

37,855. PENCIL. EBERHARD FABER, New York, N. Y. Filed July 31, 1905. Serial No. 272,136. Term of patent 7 years.

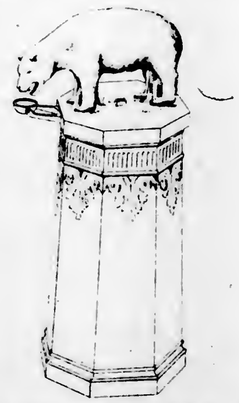
Claim.—The ornamental design for a pencil, as shown.

37,856. LANTERN. JACOB LOGLI, Portland, Oreg. Filed Aug. 16, 1905. Serial No. 274,506. Term of patent 14 years.



Claim.—The ornamental design for a lantern as herein shown.

37,857. CASE FOR VENDING-MACHINES. HENRY C. TRAUTE, New York, N. Y. Filed Jan. 15, 1906. Serial No. 296,223. Term of patent 7 years.



Claim.—The ornamental design for a case for a vending-machine as shown.

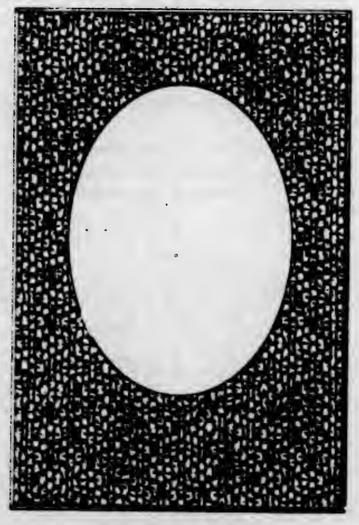
37,858. CASE FOR VENDING-MACHINES. HENRY C. TRAUTE, New York, N. Y. Filed Jan. 15, 1906. Serial No. 296,224. Term of patent 7 years.

Claim.—The ornamental design for a case for a vending-machine, as shown.

37,859. CASE FOR VENDING-MACHINES. HENRY C. TRAUTH, New York, N. Y. Filed Jan. 15, 1906. Serial No. 296,235. Term of patent 7 years.

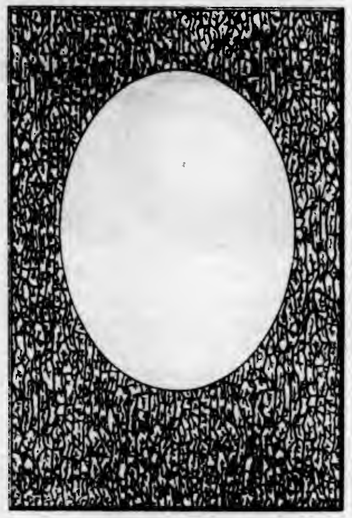
Claim.—The ornamental design for a case for a vending-machine, as shown.

37,860. CARD-MOUNT. HENRY H. COLLINS, Jr., Philadelphia, Pa. Filed Jan. 19, 1906. Serial No. 296,913. Term of patent 3½ years.



Claim.—The ornamental design for a card-mount, as shown.

37,861. CARD-MOUNT. HENRY H. COLLINS, Jr., Philadelphia, Pa. Filed Jan. 19, 1906. Serial No. 296,914. Term of patent 3½ years.

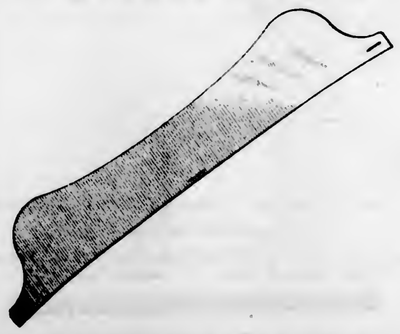


Claim.—The ornamental design for a card-mount, as shown.

37,862. PAPER BOX. PHINEAS B. MYERS, Morristown, N. J. Filed Jan. 25, 1906. Serial No. 297,910. Term of patent 7 years.

Claim.—The ornamental design for a paper box, as shown.

37,863. COLLAR. FRANK J. NOVAK, South Omaha, Nebr. Filed Aug. 29, 1905. Serial No. 276,310. Term of patent 14 years.



Claim.—The ornamental design for a collar as shown.

TRADE-MARKS

PUBLISHED FEBRUARY 27, 1906.

The following trade-marks have been adjudged entitled to registration under the act of February 20, 1905, and are published in compliance with section 6 of said act. Said section provides:

"Any person who believes he would be damaged by the registration of a mark may oppose the same by filing notice of opposition, stating the grounds therefor, in the Patent Office within thirty days after the publication of the mark sought to be registered, which said notice of opposition shall be verified by the person filing the same before one of the officers mentioned in section two of this act. If no notice of opposition is filed within said time the Commissioner shall issue a certificate of registration therefor, as hereinafter provided for."

Marks which are stated to have been "Used ten years" are registrable under the last proviso of section 5 of said act, which is as follows:

"And provided further, That nothing herein shall prevent the registration of any mark used by the applicant or his predecessors, or by those from whom title to the mark is derived, in commerce with foreign nations or among the several States, or with Indian tribes, which was in actual and exclusive use as a trade-mark of the applicant or his predecessors from whom he derived title for ten years next preceding the passage of this act."

Section 14 of said act provides for the following fee:

"On filing notice of opposition to the registration of a trade-mark, ten dollars."

SER. No. 257. WHISKY. THE UNION DISTILLING CO., Cincinnati, Ohio. Filed Apr. 3, 1905. Used ten years.

The word "LENOX," associated with the representation of a grand stand at a racing-track and a horse race showing three horses racing.

SER. No. 260. WHISKY. THE UNION DISTILLING CO., Cincinnati, Ohio. Filed Apr. 3, 1905.

The words "SOUTHERN BOUQUET," associated with the profile bust picture of a lady in evening-dress and carrying a bouquet.

SER. No. 1,198. BOOKS OF FICTION. LOTHROP, LEE & SHEPARD COMPANY, Boston, Mass. Filed Apr. 12, 1905.

PANSY

The arbitrary word "PANSY."

SER. No. 1,560. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

AUTOCYCLE

The word "AUTOCYCLE."

SER. No. 1,574. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

CHAINLESS

The word "CHAINLESS."

SER. No. 1,578. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905. Used ten years.

SER. No. 1,578.

LENOX

The word "LENOX."

SER. No. 1,583. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

LOCOMOBILE

The word "LOCOMOBILE."

SER. No. 1,584. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

TOURIST

The word "TOURIST."

SER. No. 1,585. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

PNEUMATIC

The word "PNEUMATIC."

SER. No. 1,594. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

TRI=TIRE

The words "TRI=TIRE."

SER. No. 1,599. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

LEAGUE

The word "LEAGUE."

SER. No. 1,789. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

MOTORCYCLE

The word "MOTORCYCLE."

SER. No. 1,620. RUBBER BOOTS AND SHOES. LAMBERTVILLE RUBBER COMPANY, Lambertville, N. J. Filed Apr. 15, 1905.

"SNAG-PROOF"

The word "SNAG-PROOF" in quotation-marks, associated with the representation of a rubber boot and a pair of rubber shoes. One of said shoes is shown as floating in a stream in the background to one side of the boot and the other of the shoes appears in the foreground. In and around said boot and shoes are numerous dwarfish figures or gnomes, who are represented as unsuccessfully endeavoring by means of various implements to puncture the boot and shoes. A ladder resting against the boot is breaking under the weight of a number of such dwarfish figures or gnomes. Others of said dwarfish figures or gnomes are shown as operating a steam-drill against the boot and working with other tools. On the leg of the boot appears a label bearing the word "SNAG-PROOF" and the representation of a boot around which a number of dwarfish figures or gnomes are represented as performing antics similar to those above set forth.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE DAVIDSON.

Decided December 13, 1905.

1. APPEAL—REJECTION FOR INOPERATIVENESS.

Where claims are rejected on the ground of inoperativeness, the applicant's remedy is by appeal to the Examiners-in-Chief and not by petition.

2. REJECTION FOR INOPERATIVENESS—AFFIDAVITS—JUDGMENT OF EXAMINER NOT CONTROLLED.

The Examiner is not bound to accept the conclusions stated in affidavits filed to overcome a rejection on the ground of inoperativeness, nor is he compelled to cite references and authorities, and his judgment will not be controlled on interlocutory petition.

ON PETITION.

OIL AND FEED-WATER SEPARATOR.

Messrs. C. A. Snow & Co. for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Primary Examiner rejecting claim 6 on the ground of inoperativeness.

The invention is an oil and feed-water separator, and claim 6 drawn thereto is held by the Examiner to cover an inoperative structure, because it rests upon the assumption that a solution of kerosene and cylinder-oil will stratify if allowed to stand. The Examiner holds that no such stratification will take place and refuses to change his opinion because of certain affidavits filed by the applicant. In this petition it is asked that the Examiner be instructed:

a. That an unsupported statement of theory by an Examiner is not a sufficient answer to facts established by affidavits and exhibits.

b. That in the absence of any references, or any valid objection, further delay in allowance of the application is unwarranted.

The question whether the affidavits and exhibits establish the supposed facts is a matter to be determined by the Examiner, and his judgment will not be controlled on interlocutory petition. He is not bound to accept the affidavits as proof unless he is satisfied of the truth of the allegations contained therein. He may reject the conclusion stated in the affidavits when those conclusions are contrary to well-known scientific laws or facts. In the present case the Examiner says that the allegation made in the claims and in the affidavits—

* * * involves a scientific impossibility and is a contradiction of the law of the diffusion of liquids mutually soluble in one another.

The Examiner has thus made his position clear, and it is not necessary for him to cite references or refer to authorities.

The petitioner's remedy is by appeal to the Examiners-in-Chief, and therefore this petition is dismissed.

EX PARTE GIRONCOLI.

Decided December 13, 1905.

ABANDONED APPLICATION—LONG DELAY—SATISFACTORY SHOWING REQUIRED.

A delay of four years in acting upon an application is not to be excused except upon the clearest and most satisfactory showing that it was unavoidable.

ON PETITION.

PROCESS OF PRESERVING MEAT.

Mr. Francis H. Richards for the applicant.

ALLEN, *Commissioner:*

This is a petition for a ruling that the above-entitled application is not abandoned notwithstanding the fact that no action has been taken by the applicant within the past four years.

It is alleged that the delay in acting was unavoidable, and in support thereof certain affidavits have been filed tending to show that the inventor was unwell, poor, and dependent upon others for assistance. The last action in the case was a decision by the Examiners-in-Chief on appeal, and it is alleged that the inventor was unable to raise the money necessary for a further appeal.

While the showing is such as might be accepted as a sufficient excuse for a short delay, it is not believed that it should be accepted as covering such a long period of time as has elapsed in this case. Where the delay is so long, the showing should be such as to leave no reasonable doubt of the fact that it was impossible for the inventor to proceed sooner. It is not sufficient to show that it was not convenient to proceed and that there were many difficulties in the way. The rights of the public must be taken into consideration in these cases, and it must be contemplated that others may have begun to use the invention and may have acquired rights which should not be disturbed. It is not believed that Congress contemplated that a delay of four years should be excused except upon the clearest proof.

The petition is denied.

EX PARTE RICHARDSON.

Decided December 14, 1905.

1. ABANDONED APPLICATION—ACTION NECESSARY BEFORE REVIVAL.

The question whether delay in acting upon a case was unavoidable can be determined only after action is taken, and therefore a petition not accompanied by an action must be denied.

2. SAME—INSUFFICIENT EXCUSE FOR DELAY—ERROR BY OFFICE.

Supposed error in the Examiner's action is no excuse for delay in responding beyond the year allowed by law.

ON PETITION.

SELF-FEEDING MATCH-BOX.

Mr. David P. Moore for the applicant.

ALLEN, *Commissioner:*

This is a petition from the ruling that the above-entitled application is abandoned.

No amendment or other action has been filed in the case since the last Office action and none accompanies this petition. The petition, furthermore, is not supported by an affidavit as to the facts supposed to excuse the delay in prosecution.

It is very clear that the question whether the delay in taking action upon the case was unavoidable can be determined only after the action is taken. This Office has no authority to revive a case upon which no action has been taken within one year, but merely has authority to determine after an action is taken whether the delay in presenting it was unavoidable.

It is urged by the attorney that this case should be revived because, in his opinion, the Examiner was wrong in rejecting the claims. It is well settled, however, that an error by the Office furnishes no justification for delay by the applicant beyond the period of one year allowed by statute. If such error justified delay, it would follow that an applicant may appeal from a decision at any time, since an appeal is taken because of the supposed errors in the decision.

The petition is denied.

EX PARTE KELLOGG.

Decided December 22, 1905.

1. CROSS-REFERENCE—APPLICATIONS BY DIFFERENT INVENTORS.
Where two applications filed by different inventors are owned by the same party and the assignee wishes to refer in one case to the other, *Held* that there is nothing in the rule that applications are preserved in secrecy which would make the reference improper.

2. SAME—DISCLOSURE OF INVENTION.
Reference should not be made in one application to another for a disclosure of a feature of the invention, since each application should be complete within itself.

ON PETITION.

CONTROLLING-SWITCHES FOR MOTOR-OPERATED DOORS.

Mr. Albert G. Davis for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Primary Examiner requiring the cancellation of a statement in the specification referring to an application for patent filed by another inventor.

It is alleged in the brief filed that the present applicant made an improvement upon the invention disclosed in the prior application mentioned, both parties being employed by the same company and each having knowledge of the work done by the other. Both applications are owned by the company which employs both inventors, and it is said that the statement to which objection has been made was inserted in this case for the purpose of clearness and to avoid any possible misunderstanding by this Office as to the proper lines to be drawn between the two cases.

The only objection made by the Examiner to the statement referring to the other application is that it is in violation of the requirement that applications be preserved in secrecy, as set forth in Rule 15. It is said that when this case becomes a patent the public will be informed of the pendency of the other application filed by a different party. While this is true, the only party entitled to complain is the owner of the invention and application mentioned. That owner has the right to remove the cloak of secrecy and disclose the invention to the public, since it was in his interest alone that the rule of secrecy was made. It must be held, therefore, that there is nothing in the rule of secrecy which prevents the reference in one application to another, provided the record clearly shows that the same party owns both and that the reference is made in his behalf.

Since no objection was made to the subject-matter included in the statement under consideration, it has been assumed in disposing of the case that the statement is otherwise unobjectionable. It is to be noted, however, that a party should not be permitted to refer to another application for a disclosure of an invention or of a feature. Each application must be complete within itself, and the reference to the other case is permissible only in connection with a statement sufficient in itself distinguishing between what is old and what is new in the matter disclosed. (Rule 36.)

The petition is granted.

EX PARTE SPRINGER.

Decided January 3, 1906.

APPEAL, INTERLOCUTORY—ABANDONMENT OF APPLICATION REVIEWABLE UPON.

The question of abandonment of an application for failure to prosecute is one which is reviewable by the Commissioner on petition under Rule 145 and is not appealable to the Examiners-in-Chief. Abandonment of an application must be distinguished from abandonment of invention.

ON PETITION.

DEVICE FOR THE RECORDING OF SPEECH.

Mr. Ruter W. Springer pro se.

ALLEN, *Commissioner:*

This is a petition for review and reversal of the Examiner's action refusing to forward to the Examiners-in-Chief an appeal from the Examiner's ruling that the application was abandoned by failure to prosecute it.

The question of abandonment of an application is reviewable on petition under Rule 145 and not on appeal to the Examiners-in-Chief under Rule 133. The question of abandonment which is appealable under Rule 133 is abandonment of the invention disclosed and claimed in the application and not abandonment of the application.

The Examiner was right in refusing to forward the appeal, and therefore the petition is denied.

RIKER *v.* LAW.

Decided January 3, 1906.

PRACTICE UNDER RULE 105—SUFFICIENCY OF COPY TO BE DETERMINED BY PRIMARY EXAMINER—HEARING TO PARTIES.

Where a party files a copy of portions of his application for use in interference proceedings in an attempt to comply with Rule 105, the question of the sufficiency of the copy is a matter to be determined by the Primary Examiner in the first instance. In determining this question the Primary Examiner should fix a day upon which the parties may be heard and should render a decision upon the matter in issue.

ON PETITION.

SPEED-CHANGING MECHANISM.

Mr. Frederick L. Emery for Riker.

Mr. Hermann F. Cuntz and *Messrs. Sturtevant & Greeley* for Law.

ALLEN, *Commissioner:*

This is a petition by Riker that the party Law be required to place in the interference record his entire application or a certified copy of all parts, including amendments and letters relating to the subject-matter in interference.

It appears that Law has filed a copy of portions of his application for use in the interference in supposed compliance with Rule 105; but Riker regards that copy as insufficient. Riker is entitled to see those parts of the proceedings relating to the subject-matter of the interference; but the question whether the copy furnished by Law is sufficient for that purpose is a matter which should be considered by the Primary Examiner in the first instance.

Proceedings are suspended, and the case is remanded to the Primary Examiner for action. He should fix a day upon which the parties may be heard and should render a decision upon the matter in issue.

To this extent the petition is granted.

EX PARTE WARREN.

Decided January 4, 1906.

APPEAL TO EXAMINERS-IN-CHIEF—FORWARDING—FORMAL OBJECTIONS NOT OVERCOME.

Where an appeal to the Examiners-in-Chief is filed in a case in which one of the appealed claims had been objected to on the ground that it attempted to define the article by the process of making it, it is not necessary to remove the objection before forwarding the appeal, as the objection is one that can be properly considered by the Examiners-in-Chief with the other questions of patentability.

ON PETITION.

BRUSHES.

Mr. Fred L. Chappell for the applicant.

ALLEN, *Commissioner:*

This is a petition from the Examiner's action refusing to forward an appeal to the Examiners-in-Chief filed April 26, 1905, on the ground that the application is abandoned.

The appeal was filed within one year after the Examiner's action finally rejecting the claims; but it appears that the letter of final rejection included a criticism of claim 3, which the Examiner holds should have been avoided before appeal. He therefore rules that the appeal was not such action as the condition of the case required.

The criticism of claim 3 was to the effect that it sought to define an article of manufacture by a statement of the process of making it. The matter seems to be one which may be considered properly by the Examiners-in-Chief in connection with the other questions of patentability.

The petition is granted.

EX PARTE GWINN BROS. & CO.

Decided January 4, 1906.

TRADE-MARK—ASSOCIATED REPRESENTATIONS OF ANCHOR AND SEA-MONSTER—ANTICIPATION.

A trade-mark consisting of the representation of a sea-monster associated with an anchor represented as standing vertically upon its point and having the head of the sea-monster protruding from between the anchor-arms and the body of the sea-monster entwined spirally about the shank of the anchor *Held* not registrable in view of the prior registration of a trade-mark consisting of an anchor and the arbitrarily-selected word "Anchor" placed across said representation.

ON APPEAL.

TRADE-MARK FOR WHEAT-FLOUR.

Mr. W. H. Wills and *Mr. C. T. Belt* for the appellants.

ALLEN, *Commissioner:*

This is an appeal from the decision of the Examiner of Trade-Marks refusing to register a mark described as follows:

> Our trade-mark consists of the representation of a sea-monster associated with an anchor represented as standing vertically upon its point and having the head of the sea-monster protruding from between the anchor-arms, and the body of the sea-monster entwined spirally about the shank of the anchor.

The ground of refusal is that this mark so nearly resembles a registered mark as to cause confusion. The mark referred to is that of D. & A. Luckenbach, No. 16,670, June 4, 1889, which is said to be used upon goods of the same character as the appellants'. It is said in this registration:

> The trade-mark consists of the representation of an anchor and the arbitrarily-selected word "Anchor" placed across said representation.

Both marks therefore include a representation of an anchor.

In connection with this appeal a paper has been filed, saying:

> Your orator, the associate attorney, having been engaged to answer this appeal, finds the description or claim appealed not to be a true and correct description of application. It fails to identify the Aldine device.

The same paper includes a proposed amendment to the application seeking to avoid the reference cited. It is clear that such amendment should be considered, if at all, by the Examiner in the first instance.

It is held that the Examiner was right in refusing registration of the case as presented, and therefore his decision must be affirmed. If he concludes that the proposed amendment avoids the reference cited, he is at liberty to enter it and act upon the case in view thereof.

The decision of the Examiner is affirmed.

EX PARTE SINDINGCHRISTENSEN.

Decided January 4, 1906.

REJECTION—AGGREGATION CLAIMS—SEPARATE FEATURES MAY BE FOUND IN DIFFERENT REFERENCES.

Where claims are considered to be aggregations, it is not necessary to a valid rejection thereof that all the features specified in the claims shall be found in a single reference. A rejection for lack of patentable novelty in view of the prior art calls for a general view of the prior art. This general view can be obtained only by looking at each reference cited in the light of the disclosure contained in the other references. It is the knowledge of the public derived not from one patent alone, but from all which negatives patentable novelty in any case.

ON PETITION.

APPARATUS FOR ELECTRIC LIGHTING.

Mr. Burnham C. Stickney for the applicant.

ALLEN, *Commissioner:*

This is a petition that the Examiner be instructed to withdraw his final rejection of June 26, 1905, and explain more fully his position in regard to the references cited.

It appears that after several letters of rejection by the Examiner and amendments and arguments by the applicant the Examiner wrote an eight-page letter on May 20, 1903, explaining fully his views as to the main features of the applicant's supposed invention and the reasons why those features were regarded as lacking in patentable novelty. Thereafter the applicant filed communications containing numerous questions in regard to the numerous references. Those questions dealt with each reference sep-

arately and purported to seek an explanation wherein that particular reference disclosed certain elements of an alleged combination. The Examiner replied that it was unnecessary to answer these questions in detail, since they were irrelevant, and to discuss them would obscure rather than make clear the issue. He further said:

It has never been pretended that the Office had any one reference showing all of the features claimed, and it has been necessary to "piece together several patents in order to reject claims" for the reason that the claims so rejected were obviously and clearly the results of a piecing together of the features of the references, involving clearly nothing further than aggregations of these features.

The applicant seems to think that the Examiner has not made his position clear merely because he has not pointed out wherein a single reference anticipates the claims, although, as pointed out in the above quotation, the Examiner has never taken the position that there is such anticipation by a single reference. In his argument the applicant seems to have overlooked the fact that a rejection for lack of patentable novelty in view of the prior art calls for a general view of the prior art and that this general view can be obtained only by looking at each reference cited in the light of the disclosure contained in the other references. It is the knowledge of the public derived not from one patent alone, but from all, which negatives patentable novelty in any case.

Although the Examiner has not answered specifically all of the questions asked, he has made his position clear, and therefore this petition is denied.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

IN RE THOMSON.

Decided January 4, 1906.

1. PATENTABILITY—AFFIDAVITS.

Held that affidavits going to show the practical success of the applicant's device where the truth thereof is substantially conceded are entitled to material weight in view of the fact that the grant of a patent confers no absolute right of property and in view of the customary rule of resolving ordinary doubts in favor of applicants.

2. SAME—POPULARITY CONSEQUENTIAL ONLY WHEN NOVELTY IS IN DOUBT.

A patent should not be granted merely because a device or combination may possess great advantages, thereby bringing it into immediate use, as it is only when the question of novelty is in doubt that the fact that the device has gone into commercial use, displacing others employed for a like purpose or supplying the place of others whose intrinsic defects have prevented their general adoption and use, is sufficient to turn the scale in favor of invention. (*Potts* v. *Creager*, 155 U. S., 597, 609.)

3. SAME—COMBINATION—PRIOR COMBINATION DIFFERENT.

Where the applicant claimed a combination of old elements and a reference shows a combination which is intended for a different use and which involves differences of operation and one of the elements shown in the reference is different from the corresponding element in the applicant's device, *Held* that a patent should not necessarily be refused on account of such reference.

4. SAME—SAME—SAME.

Where a prior combination cited against the combination claimed includes elements in addition to those used by the applicant which result in differences in operation undesirable for the purposes of the applicant's device and one of the elements of the prior combination is different from the corresponding element of the applicant's combination, *Held* that a patent should not necessarily be refused on account of the prior combination.

5. SAME—RESOLVING DOUBTS.

Where there was doubt as to the sufficiency of the references and the applicant demonstrated that he had produced an apparatus of great utility, *Held* that the doubt should be resolved in favor of the applicant's claim.

6. PATENTS—EFFECT OF GRANT.

By the grant of a patent a patentee is merely put in a position to assert his *prima facie* right against infringers who may in their defense raise the question of the validity of the patent and have the same finally adjudicated in the light of a full presentation and consideration of all the evidence attainable in respect of anticipation, prior knowledge, use, and the like.

Mr. F. P. Warfield, *Mr. H. S. Duell*, *Mr. R. S. Blair*, *Mr. A. F. Nathan*, and *Mr. C. H. Wilson* for the appellant.

Mr. J. M. Coit for the Commissioner of Patents.

SHEPARD, *J.*:

This is an appeal from a decision of the Commissioner of Patents rejecting an application for a patent for an improvement in lighting systems.

The consideration of the merits of the applicant's alleged novel combination was embarrassed, and possibly prejudiced, by the great number of claims presented and insisted upon throughout the proceedings in the Patent Office. On this appeal, the applicant has abandoned all of his twenty-one claims except the four following:

3. In combination, a shunt-wound generator having serially included in its field-circuit a plurality of contacting electrodes and positively-acting electromagnetic means controlled by the current output of the generator for varying the pressure with which said electrodes contact.

13. In a car-axle lighting system, in combination, a dynamo adapted to be driven from a car-axle, said dynamo having a single field-circuit shunt-wound from the main circuit, a variable-resistance device included in said field-circuit, said device embodying a material whose resistance varies with pressure, a controlling device in series with the main circuit of the dynamo, said controlling device adapted to be operated by variations of current in said main circuit, and connections from said controlling device for varying the pressure on said resistance device.

17. In a car-axle lighting system, in combination, a dynamo adapted to be driven from a car-axle, said dynamo having a field-circuit shunt-wound from the main circuit, a series of carbon disks interposed in said field-circuit, a controlling device adapted to be actuated by variations in current in the main circuit of the dynamo and in series therewith, a connection between said controlling device and said disks such that pressure on said disks is decreased as the current in the main circuit increases, and a spring acting upon said disks in opposition to said controlling device to increase the pressure thereon.

20. In a car-axle lighting system, in combination, a dynamo adapted to be driven from a car-axle, said dynamo having a field-circuit shunt-wound from the main circuit, a series of carbon disks included in said field-circuit, a solenoid in series with the main circuit of the dynamo and independent of the field-circuit, a connection between the plunger of said solenoid and said disks such that the pressure upon said disks is decreased as the current in the main circuit increases, and a spring adapted to act upon said disks to increase the pressure thereon in opposition to said solenoid.

In rejecting the series of claims, the tribunals of the Patent Office referred to a number of patents, the most important of which are: Weston, No. 292,715, of January 29, 1884; Moskowitz, No. 626,713, of June 13, 1899; and Creveling, No. 688,394, of December 10, 1901.

The object sought to be accomplished by the combination of the application is a practical and effective system of electrical lighting for railway-cars, and there is no doubt of the great and urgent demand for such a system.

Two systems of electrical car-lighting have heretofore been in use. In the first of these, cumbersome storage batteries have been used in the cars which must be charged from time to time. This involves labor, loss of time, and expense, practically confining the use to comparatively short trips, and apparently preventing general adoption. The second system, which it seems has been as little used as the first, is operated by a generator driven from the locomotive. This involves a complicated system of connections rendering the installation and maintenance expensive and otherwise unsatisfactory. On account of these objections, systems of electrical car-lighting have not gone into anything like general use on the principal railways of the country. The general conclusion of practical railway

managers, it seems, has been, that for practical use each car must be made to generate its own current through the power furnished by its own axles when in motion. In such a system the storage battery is a necessary accessory in order to maintain the light when the car is at rest. The difficulty with such a system lies in the variable speed of the cars through which the current is increased or diminished, thereby seriously affecting the character of the light furnished. The object of the invention, as claimed, is to overcome this difficulty through a combination the dominant features of which consist in the character of the variable-resistance device used as a means for controlling the shunt-circuit of the generator, and the relation of this variable-resistance device to the shunt-circuit and to the current output of the dynamo.

Before the final hearing before the Commissioner, affidavits were received and filed, showing that a full-sized apparatus, constructed in accordance with the specifications and claims of the application, had been installed in a car on the New York Central Railroad in October 1904; and that said car had been run daily, from that time until the date of the affidavits, between New York and Troy, a distance of three hundred miles. It was further shown, that during the entire period the apparatus had worked in a satisfactory manner completely demonstrating its practical efficiency.

The applicant does not claim the invention of any distinctly new element, but a combination of elements which mutually coact and interact to produce a new result—not the mere sum of the results of individual, or separate use, but a result due to their conjoint use in the course of which they mutually affect one another through their peculiar adaptation for use one with another.

The tribunals in the Patent Office, while admitting the manifest advantages of the applicant's combination system over others, deny the claim aforesaid. Based on the references to existing patents, their conclusion was, substantially, that the various devices of the combination are old; that the resulting advantages are inherent in the several devices themselves; and that their operation and value are matters of common knowledge to be availed of by mechanical, electrical skill.

Their conclusion, however, is not made so clear to our minds by the discussion of the references as it appears to have been to their own.

The Weston patent, on which great stress is laid, shows an ordinary lighting system. Referring to this the Examiners-in-Chief say of the applicant:

He created no new situation except in the limited sense that he has applied carbon resistance to the old Weston system, which is practically identical with the applicant's system except in the use of a different form of variable resistance.

We are not prepared to accept this view of the identity of the two systems as broadly stated. It is true that Weston, whose system was intended for a different use from that of the applicant, shows a shunt-wound generator with a variable resistance in its field-circuit, apparently designed to regulate the positions of the carbons of a series of arc-lamps as illustrated by the drawings.

The resistance devices of the two systems are admitted to be different. There is, however, another important difference in that applicant's device, through pressure resistance in the shunt-field of the generator, exercises control from or upon the main current or output of the dynamo which is essential to the successful operation of his system.

It was further said, in rejecting the application, that Creveling's system shows the features of the applicant's, except in respect of the particular type of the variable resistance, and would operate in the same way by the transfer thereto of the variable resistance device of Moskowitz's patent. This involves the elimination of certain features of Creveling not found in applicant's combination. Bearing in mind that the applicant expressly disclaims the invention of any distinctly new element in his combination, and without analyzing the other features referred to, the foregoing proposition may be conceded to be correct in a very general sense. As before stated, applicant's contention is that he has combined old elements, changing and adapting them in such a way as to produce a new and useful result, indicating the exercise of inventive talent, rather than of the mechanical skill of an expert electrician.

Granting a general similarity of construction and purpose in other resistance devices, it has not been denied that they operate with what has been called a "step-by-step" action, tending to produce a partial and jerking regulation, whereby, through frequent increase or diminution of current, small changes would result in great variations in the brilliancy of the series of lamps. As pointed out by the applicant, with all of these old resistance devices, a considerable movement of the armature of the controlling-magnet is necessary to effect regulation—a movement which results either in bringing the armature closer to the magnet, in a position to be more strongly affected thereby, or in permitting the armature to move farther away, with the opposite effect. If then, the magnet or solenoid be of constant strength it would have a stronger pull upon the armature or plunger owing to its being brought so much nearer thereto, or weaker owing to its being so much farther removed. And this is independent of any increase in attraction due to rise of current and results, upon the armature moving toward the magnet, in an excessive pull thereupon and consequent increase in the field-circuit beyond that contemplated by the regulating system employed. On the other hand, it is claimed that in the apparatus of the applicant, no such error can arise, because there is an insignificant, almost inappreciable movement in accomplishing the regulation, by which the armature does not, necessarily, materially approach or recede from the magnet. This nicely-adjusted continuous variation of resistance, with its consequent elimination of flickering in the lamps, would be valueless if the potential or voltage coil be used with an introduction of current changes compared with which those due to a step-by-step resistance would be insignificant.

There is a special adaptation of this pressure resistance in the shunt-field whereby the current is maintained substantially uniform for use with a controlling device directly affected by the current; that is to say, there is a special adaptation of this control direct from the current for use with a resistance device of this type. If this supersensitive variable-resistance device be controlled by any indirect factor, as voltage, for example, which would necessarily introduce errors into the regulation, this very sensitiveness would multiply the effect of such errors and render the system a useless one. Therefore, to use the sensitive pressure-controlled resistance to produce the requisite even brilliancy of the lamps, it is essential that the same be acted upon directly by the factor upon which this brilliancy depends, namely, the current.

Instancing the difficulties and failures of other systems of car-lighting, the urgent demand for a new and improved one, relieved of those difficulties, and the failure of skilled electricians, working in the same field, to satisfy that demand, the applicant contends that his adaptation of former devices in a new combination, obtaining thereby a new and satisfactory result, passes beyond the boundary of mechanical skill and attains the dignity of invention.

Between these opposing contentions we must confess some doubt as to which is the correct one.

In case of ordinary doubt, the policy of the patent system, as customarily maintained in the Patent Office, has been to give the applicant the benefit thereof, because no absolute right of property is conferred by the grant of a patent. (*Ex parte Fanshawe*, C. D., 1891, 203.) The patentee is merely put in a position to assert his *prima facie* right against infringers who may, in their defense, raise the question of the validity of the patent, and have the same finally adjudicated in the light of a full presentation and consideration of all the evidence attainable in respect of anticipation, prior knowledge, use, and the like.

In view of these considerations, the testimony going to show the practical success of the applicant's combination, the truth of which is substantially conceded, is entitled to material weight. Owing to the very serious difficulties, which appear to have been successfully overcome by the applicant, other electrical train-lighting systems have not gone into general use. The demand for an improved system has been an urgent one for years, and yet no other inventor, or electrical expert, with all the knowledge afforded by prior patents and constructions, has succeeded in devising a system answering this demand.

Now that it has succeeded [as said by Mr. Justice Bradley] it may seem very plain to any one that he could have done it as well. This is often the case with inventions of the greatest merit. It may be laid down as a general rule, though perhaps not an invariable one, that if a new combination and arrangement of known elements produce a new and useful result never attained before, it is evidence of invention. (*Loom Co.* v. *Higgins*, 105 U. S., 580, 591.)

We are, of course, not to be understood as maintaining that, merely because a device or combination may possess great advantages over others, thereby bringing it into immediate general use, a patent should, therefore, be granted for it as an invention. The fact is important only in those instances where, irrespective of it, the question of novelty remains in doubt. It is only when the question of novelty is in doubt, that the fact that the device has gone into commercial use, displacing others employed for a like purpose, or supplying the place of others whose intrinsic defects have prevented their general adoption and use, is sufficient to turn the scale in favor of invention. (*Potts* v. *Creager* 155 U. S., 597, 609.)

Entertaining such a doubt in this case, we think it just, and in accordance with precedent, that the applicant's demonstrated success in producing an apparatus of great utility, ought to resolve that doubt in favor of his claim. (*Cleveland Foundry Co.* v. *Kauffman*, 135 Fed. Rep., C. C. A., 360, 362.)

For these reasons, the decision will be reversed as to the four claims recited, and this decision will be certified to the Commissioner of Patents as the law directs. Reversed.

Ruling of Cuban Government Relative to International Registration of Trade-Marks.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., February 17, 1906.

This Office has received, through the Department of State, a copy of the following ruling by the Cuban Government in regard to its enforcement of the Madrid arrangement of April 14, 1891, relative to the international registration of trade-marks.

F. I. ALLEN,
Commissioner.

[Inclosure to Despatch No. 1,453.]

(Translation.)

DEPARTMENT OF AGRICULTURE, INDUSTRY AND COMMERCE.

Ruling.—For the enforcement of the Madrid arrangement of April 14, 1891, relative to the international registration of trade-marks.

I. Any private or legal person in lawful possession of a trade-mark duly registered in his name in the proper office of the Department of Agriculture, Industry and Commerce may, as provided for in the arrangement of April 14, 1891, concerning the international registration of trade-marks, promulgated in the *Official Gazette* of December 27, 1904, obtain protection for such trade-mark in the subscribing states and in any state that may in future subscribe to the said arrangement by the compliance with the formalities called for in this ruling.

II. Parties concerned shall make written application, over their own signature or that of a properly-authorized person, to the Secretary of Agriculture, Industry and Commerce, in which shall be detailed the name and surname of the applicant, his nationality, the place where he has his establishment, the number and date of his certificate of registration in Cuba, of the mark or marks for which international registration is sought and the product or article that each mark is for.

III. Said application must be accompanied by:

a. An engraving or typographical cut of each mark so that it may be printed in black in the official periodical of the International Office. These cuts must exactly reproduce the mark just as it was when granted and in such manner that all details will be visible. It should not be less than fifteen millimeters nor more than ten centimeters in either length or breadth. The exact thickness of the cut should be twenty-four millimeters, the same as the height of printing-type.

b. Three sample typographical reproductions on white paper of the cut demanded in the preceding paragraph.

c. When it is urged that the distinguishing feature of a mark is its color the applicant shall be obliged to so declare accompanying his application with a description in which the color is mentioned and inclosing forty-two samples of the said mark in color.

d. A postal money-order or check for 100 francs in the case of a single mark and of fifty francs additional for each mark whose registration is sought at the same time by the same owner, the order or check to be in favor of the "International Bureau of Industrial Property, Berne."

e. An authorized power of attorney when the application is made by proxy.

f. The official receipt showing that the Government tax of $5.00 official money, provided for by Article VIII of the arrangement of April 14, above mentioned, has been paid in the collector's office of the proper fiscal zone.

IV. Requests for registration sent to the International Office will be placed in the respective files of the archives of national marks and in turn, the international registration having been effected, given the number of such registration.

V. Trespass on trade-mark property and any alteration trade-marks may suffer shall be communicated officially by those in charge of the national files to the official in charge of international marks and by him in turn to the International Office at Berne as provided for and according to the said arrangement and this ruling.

VI. The Department of Agriculture, Industry and Commerce shall immediately transmit to interested parties all news received by the International Office relating to their marks and will also inform them of the refusal of any of the subscribing nations to protect their marks.

VII. Six months before the expiration of the term of protection in this Republic the Secretary of Agriculture, Industry and Commerce will advise the owners of internationally-registered Cuban marks that in order to continue the international registration in force, as provided by Article VI of the arrangement of April 14th, 1891, they must take steps to again register their national marks.

VIII. The terms of the foregoing article in no wise affect the dispositions of Articles VI and VII of the said arrangement so far as they concern the duration of the international registration which shall remain in force during the entire time that the national registration of the mark is effective.

IX. To renew the international registration at the expiration of its twenty-year term, the same formalities must be observed as if a mark were being so registered for the first time, excepting the cut which it will be unnecessary to furnish.

XI. In order to give publicity to international marks an album of internationally-registered marks may be consulted by the public in the Department of Agriculture, Industry and Commerce during office hours.

HAVANA, *October 28, 1905.*

T. ESTRADE PALMA.

GABRIEL CASUSO,
Secretary of Agriculture, Industry and Commerce.

Which, by order of the Secretary, shall be published in the *Official Gazette* so that it may be generally known, and shall be enforced from the tenth day after its publication.

FRANCISCO I. DE VILDOSOLA,
Assistant Secretary.

HAVANA, *January 15, 1906.*

DIGEST OF DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS

IN THE MATTER OF

PATENTS, TRADE-MARKS, ETC.

OFFICIAL GAZETTE—JANUARY–FEBRUARY, 1906.

VOL. 120 O G—2

DIGEST OF DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS

IN THE MATTER OF

PATENTS, TRADE-MARKS, ETC.

OFFICIAL GAZETTE—JANUARY–FEBRUARY, 1906.

VOL. 120 O G—2

DIGEST OF DECISIONS.

[Decisions of the United States courts are indicated by an asterisk (*) and of the Secretary of the Interior by a dagger (†).]

ABANDONED APPLICATIONS.

1. LONG DELAY—SATISFACTORY SHOWING REQUIRED.
A delay of four years in acting upon an application is not to be excused except upon the clearest and most satisfactory showing that it was unavoidable. [*Ex parte* Gironcoli, 2753.

2. ACTION NECESSARY BEFORE REVIVAL.
The question whether delay in acting upon a case was unavoidable can be determined only after action is taken, and therefore a petition not accompanied by an action must be denied. [*Ex parte* Richardson, 2753.

3. INSUFFICIENT EXCUSE FOR DELAY—ERROR BY OFFICE.
Supposed error in the Examiner's action is no excuse for delay in responding beyond the year allowed by law. [Id.

ABANDONMENT OF APPLICATIONS.

(See Prosecution of Application by Assignee; Trade-Marks, 5, 6, 7, 8.)

1. FAILURE TO PROSECUTE—SUFFICIENCY OF AMENDMENT.
Where certain formal objections are raised and the claims are finally rejected, an amendment curing the formal objections will not save the case from abandonment, even though by curing the formal objections the scope of the claims is changed. A final rejection must be met by an appeal and not by an amendment changing the scope of the claims.
[*Ex parte* Walton, 659.

2. SAME—APPLICANT BOUND BY ACTS OF ATTORNEY.
Where applicant's attorneys place the case in condition for final action and final action is given, the applicant cannot secure an extension of the time allowed by law by revoking the power of attorney and filing a request for further explanation, even though such request is filed within the year.
[*Ex parte* Cazin, 660.

3. REVIEW OF FORMER COMMISSIONER'S DECISION—ALLEGATION OF FRAUD BY APPLICANT.
The question of abandonment of an application decided by a former Commissioner will not be reviewed except upon a clear and satisfactory showing that the Commissioner was misled by the applicant as to the facts, and mere *ex parte* affidavits cannot be regarded as such showing. [Kinsman *v.* Strohm, 2127.

4. APPEAL, INTERLOCUTORY—REVIEWABLE UPON APPEAL.
The question of abandonment of an application for failure to prosecute is one which is reviewable by the Commissioner on petition under Rule 145 and is not appealable to the Examiners-in-Chief. Abandonment of an application must be distinguished from abandonment of invention.
[*Ex parte* Springer, 2754.

ACCESS TO PENDING APPLICATIONS.

PATENT AND APPLICATION.
Where a patent is granted containing the statement that it is a continuation *in part* of a prior application, access to such prior application will not be granted to strangers without a proper showing of interest and without giving the applicant an opportunity to oppose such action, particularly where such prior application is still pending, and it appears that its subject-matter is not identical with that of the patent.
[*Ex parte* Wixford, 1166.

ACTS OF 1881 AND 1905.

(See Trade-Marks, 24, 25.)

ACTS OF 1881 AND 1905 COMPARED.
The act of 1905 contains the same provisions and has the same meaning as the act of 1881 in so far as the limitation to goods of substantially the same descriptive properties is concerned.
[*Ex parte* A. G. Spalding & Bros., 325.

AFFIDAVITS.

(See Abandonment of Applications, 2; Examination of Applications, 3; Invention, 4; Reopening of Rejected Cases, 2.)

AFFIDAVIT UNDER RULE 75.

(See Reopening of Rejected Cases, 1.)

NOT ADMITTED AFTER FINAL REJECTION.
After a claim has been finally rejected on several references an antedating affidavit under Rule 75 tending to overcome one of the references cannot be admitted. [*Ex parte* Berg, 903.

AGGREGATION.

(See Rejection of Claims, 2.)

AMBIGUOUS TERMS.

(See Claims, 2, 5.)

AMENDMENT AFTER FINAL REJECTION.

SHOWING REQUIRED.
The statement of the attorney that the subject-matter of a proposed amendment filed after final rejection was not earlier called to his attention by the inventor is not a sufficient showing upon which to admit the amendment.
[*Ex parte* Schrader, 2127.

AMENDMENTS.

(See Abandonment of Applications, 1; Amendment After Final Rejection; Interference, 28; Trade-Marks, 3, 24, 25.)

AMENDMENT TO PRELIMINARY STATEMENTS.

(See Priority of Invention, 1.)

INTERFERENCE—APPEAL ON PRIORITY.
A motion to amend a preliminary statement to correct the inadvertent use of the word "model" instead of the words "full-sized machine" will not be granted where it is found that the device referred to as the "full-sized machine" does not disclose the issue. [Parkes *v.* Lewis, 323.

ANCILLARY QUESTIONS.

(See Interference, 26.)

ANTICIPATION.

(See Invention, 3; Trade-Marks, 9, 34.)

APPEAL.

(See Appeal to the Commissioner of Patents; Appeal to the Examiners-in-Chief; Interference, 8, 9; Limit of Appeal; Motion to Dissolve Interference, 8, 10, 12.)

APPEAL FROM THE EXAMINERS-IN-CHIEF.

(See Motion to Dissolve Interference, 1.)

APPEAL FROM FAVORABLE DECISION.

(See Interference, 15.)

APPEAL TO THE COMMISSIONER OF PATENTS.

(See Interference, 14, 15; Motion to Dissolve Interference, 1; Supervisory Authority of the Secretary of the Interior Over the Commissioner of Patents.)

INTERFERENCE—APPEAL OR MOTION [illegible]

3. PRACTICE ANALOGOUS TO THAT APPLIED TO DIVISIONAL APPLICATIONS.
It is the uniform custom of the Office to apply to divisional applications assignments of the original cases, and no good reason is seen why the same practice should not be applied [illegible]

COMMISSIONER OF PATENTS.

(See Interference, 13, 20, 21.)

DESCRIPTION.

(See Design, 1; Examination of

APPEAL TO THE COMMISSIONER OF PATENTS.

(See Interference, 14, 15; Motion to Dissolve Interference, 1; Supervisory Authority of the Secretary of the Interior Over the Commissioner of Patents.)

INTERFERENCE—APPEAL ON MOTION TO DISSOLVE—NON-APPEALABLE QUESTIONS RAISED.
Concerning an appeal taken to the Commissioner from a decision of the Primary Examiner denying a motion to dissolve an interference, *Held* that the appeal to the Commissioner, though alleging the appealable questions of interference in fact and irregularity in declaration, was one attempting to raise by indirection the non-appealable question of an opponent's right to make certain claims. [†Blackmore *v.* Hall, 1477.

APPEAL TO THE COURT OF APPEALS OF THE DISTRICT OF COLUMBIA.

(See Trade-Marks, 24.)

APPEAL TO THE EXAMINERS-IN-CHIEF.

(See Abandonment of Applications, 4; Claims, 3; Motion to Dissolve Interference, 1; Rejection of Claims, 1.)

1. APPEAL AFTER EXPIRATION OF LIMIT OF APPEAL—VERIFIED SHOWING.
A petition to extend the limit of appeal to include an appeal filed after the expiration thereof must be supported by a verified showing in excuse for the delay. (*Ex parte Kleitzker* and *Gessel* v. *Dodson*, 109 O. G., 1336.) [Autenrieth and Kane *v.* Sorensen, 2126.

2. FORWARDING—FORMAL OBJECTIONS NOT OVERCOME.
Where an appeal to the Examiners-in-Chief is filed in a case in which one of the appealed claims had been objected to on the ground that it attempted to define the article by the process of making it, it is not necessary to remove the objection before forwarding the appeal, as the objection is one that can be properly considered by the Examiners-in-Chief with the other questions of patentability. [*Ex parte* Warren, 2755.

APPLICANT AND PATENTEE.

(See Interference, 19.)

APPLICATIONS.

(Abandoned Applications; Abandonment of Applications; Access to Pending Applications; Applications by Different Inventors, Same Assignee; Assignments, 1; Examination of Applications; Invention; Priority of Invention, 5; Prosecution of Application by Assignee; Reissue; Rejection of Claims; Trade-Marks, 2, 3, 4, 5, 6, 7, 8.)

APPLICATIONS BY DIFFERENT INVENTORS, SAME ASSIGNEE.

1. CROSS-REFERENCE—APPLICATIONS BY DIFFERENT INVENTORS.
Where two applications filed by different inventors are owned by the same party and the assignee wishes to refer in one case to the other, *Held* that there is nothing in the rule that applications are preserved in secrecy which would make the reference improper. [*Ex parte* Kellogg, 2754.

2. SAME—DISCLOSURE OF INVENTION.
Reference should not be made in one application to another for a disclosure of a feature of the invention, since each application should be complete within itself. [Id.

ASSIGNEES.

(See Applications by Different Inventors, Same Assignee; Assignments, 2, 4; Interference, 33; Prosecution of Application by Assignee.)

ASSIGNMENTS.

1. IDENTIFICATION BY DATE OF EXECUTION OF APPLICATION.
An assignment does not identify an application with certainty where it alleges that such application was executed November 9, 1904, but the notary's certificate attached to the application bears the date of November 9, 1890. [*Ex parte* Wurts, 2441.

2. IDENTIFICATION OF INVENTION BY REFERENCE TO CAVEAT.
An assignment executed by an inventor transferring his entire interest in certain inventions disclosed in a caveat filed in the Patent Office, identifying such caveat by date of filing and subject-matter, and requesting that the patent upon the application "which I am about to make" issue to the assignee, identifies an application subsequently filed sufficiently to warrant its recognition by the Office where it is found that the subject-matter of the caveat corresponds to that of the application. [Id.

3. PRACTICE ANALOGOUS TO THAT APPLIED TO DIVISIONAL APPLICATIONS.
It is the uniform custom of the Office to apply to divisional applications assignments of the original cases, and no good reason is seen why the same practice should not be applied to caveats and subsequent applications for the same subject-matter. [Id.

4. TWO ASSIGNMENTS OF SAME INVENTOR—FIRST ASSIGNEE RECOGNIZED.
Where an inventor assigns his entire invention to another, identifying the invention by reference to a caveat filed in the Patent Office, and requests that the patent which may be issued on an application which he is "about to make" be issued to the assignee, and subsequently makes another assignment of the same invention similar to the first, except that he identifies the invention by referring to the date of execution of the application, the first assignee is entitled to prosecute the application and receive the patent, as the first assignment, as well as the second, conveys the legal title. [Id.

ATTORNEYS.

(See Abandonment of Applications, 2; Amendment After Final Rejection.)

BURDEN OF PROOF.

(See Interference, 17, 19.)

CAVEAT.

(See Assignments, 2, 3, 4.)

CERTIFIED COPIES OF PARTS OF APPLICATION.

(See Interference, 42.)

CLAIMS.

(See Abandonment of Applications, 1; Affidavit Under Rule 75; Appeal to the Examiners-in-Chief, 2; Examination of Applications, 1, 2, 3; Interference, 1, 2, 27, 28, 30, 31; Rejection of Claims; Reopening of Rejected Cases, 1.)

1. ALTERNATIVE.
A claim should not be drawn in an alternative form even where the alternative elements are equivalents, but should use some broad term of description which will include both forms. [*Ex parte* Caldwell and Barr, 2125.

2. SAME—INDEFINITE.
A claim including a description of an element as "brick or the like" is alternative in form and is indefinite, since the word "like" fails to identify the characteristics of the substance. [Id.

3. MULTIPLICATION OF—REQUIREMENT TO ELIMINATE APPEALABLE TO EXAMINERS-IN-CHIEF.
The requirement to eliminate certain claims because they are substantially the same as other claims in the same case is to be regarded as a rejection and is appealable to the Examiners-in-Chief. [*Ex parte* Chapman, 2446.

4. MULTIPLICATION OF CLAIMS NOT PERMITTED—EFFECT ON PATENT.
The multiplication of claims is not to be permitted, since it tends to impose a needless burden upon the Office in the examination of the application, and a patent including them would tend to deceive and confuse the public. Moreover, it may lead to a strict construction of the patent, and it may in some cases render the patent void. [Id.

5. THE WORDS "PARTIALLY SATURATED" OBJECTIONABLE.
A claim for "lumber partially saturated with sulfuric acid" *Held* to be objectionable, the words "partially saturated" being inapt. [Id.

CLERICAL ERRORS.

DEPOSITIONS.

(See Interference, 12, 21.)

DESCRIPTION.

(See Designs, 1; Examination of Applications, 1.)

DESCRIPTION OF GOODS.

(See Trade-Marks, 22, 23.)

1. TRADE-MARKS—DESCRIPTION OF PARTICULAR GOODS—STATUTORY REQUIREMENT.
Where a trade-mark application said that the mark had been used upon "implements, apparatus, and goods used in athletic games and sports," registration was properly refused on the ground that the statutory requirement for a description of the particular goods had not been complied with. [*Ex parte* A. G. Spalding & Bros., 325.

2. SAME—SAME—INDEFINITENESS—PRIMA FACIE RIGHT.
A description which is so indefinite as to convey no intelligible idea of the particular goods upon which the mark has been used is not a compliance with the statute and does not make out a *prima facie* right to registration. [Id.

3. SAME—USE UPON PARTICULAR GOODS NECESSARY—FACTS, NOT CONCLUSIONS, MUST BE STATED.
An applicant's right to registration of a trade-mark is dependent upon his use of it upon some specific goods, and under the terms of the statute the facts upon which the right is based must be stated, leaving the scope of the right acquired for subsequent judicial determination. [Id.

4. SAME—SAME—GOODS NOT OF SUBSTANTIALLY THE SAME DESCRIPTIVE PROPERTIES.
Where the description of the goods upon which the mark has been used is in such broad and general terms as to include goods which are not of substantially the same descriptive properties, registration must be refused on the ground that the application is not limited to a single trade-mark right. [Id.

5. SAME—DIVISION—SINGLE TRADE-MARK RIGHT.
A single trade-mark registration should include only a single trade-mark right, and a single right extends no further than to merchandise having substantially the same descriptive properties. [Id.

DESIGNS.

1. FONT OF TYPE—ILLUSTRATION.
Where criticism was made that the type were not shown, but only the kind of printed matter produced, *Held* that the answer thereto is that the conventional drawing accepted by the Patent Office for years has been furnished and that the absence of description is authorized by the Patent Office rules. [**In re* Schraubstadter, 1167.

2. PATENTABILITY—INVENTION.
Where small differences existed in the applicant's design over the references, which differences would appear greater to an expert than to the average observer, *Held*, nevertheless, that the design was not patentable, because the differences did not rise to the dignity of invention. [*Id.

3. SAME—SAME.
Where peculiarities in the applicant's design were such as to prevent that design from being regarded in the trade as a substitute for the design shown by the references, *Held* that the applicant's design was nevertheless not patentable, because such peculiarities did not rise to the dignity of invention. [*Id.

4. SAME—EFFECT ON AVERAGE OBSERVER—ARTISTS AND EXPERTS.
Held that the conclusion of the Court in *Gorham Co.* v. *White* (2 O. G., 592; 14 Wall., 511) was that the novelty of a design was to be determined and infringement decided by the comparative appearance of the designs in the eyes of average observers and was not to be determined by such appearance to the eyes of experts. [*Id.

5 SAME—SAME—SAME.
Where contention was made that it is impracticable for the Patent Office to pass on esthetic values and that the proper estimation of the applicant's design required cultivated taste, *Held* that the statutes as construed by the courts intend that the patentability of designs shall be determined by their appeal to the eye of the ordinary man. [*Id.

. SAME—FONT OF TYPE.
Where the applicant's design was for a font of type in which the letters had a waved outline, *Held* that aside from the waved outline the letters seemed to be of a very ordinary style and that to add a waved outline, which was old, to common forms of letters did not involve invention. [*Id.

EXAMINATION OF APPLICATIONS.

(See Amendment After Final Rejection; Amendments; Claims; Rejection of Claims; Specifications; Trade-Marks.)

1. DESCRIPTION—REFERENCE TO MODIFICATIONS—CANCELATION NOT REQUIRED

Where the applicant states in his specification that he does not regard his invention as limited to the exact details of construction and it appears that his claims are not so limited, *Held* that he should not be required to cancel the statement as superfluous. (*Ex parte Champ*, 114 O. G., 1827, distinguished.) [*Ex parte* Jansson, 2126.

2. SAME—SCOPE OF CLAIMS—INTENT OF APPLICANT MATERIAL.

In a case of doubt the intent of the applicant in using a term in a claim and the understanding of the Office in allowing the claim have a material bearing upon its meaning and scope, and therefore the applicant should not be required to cancel statements where such cancelation may result in a more limited construction of the claim than is necessary. [Id.

3. REJECTION FOR INOPERATIVENESS—AFFIDAVITS—JUDGMENT OF EXAMINER NOT CONTROLLED.

The Examiner is not bound to accept the conclusions stated in affidavits filed to overcome a rejection on the ground of inoperativeness, nor is he compelled to cite references and authorities, and his judgment will not be controlled on interlocutory petition. [*Ex parte* Davidson, 2753.

FORMER DECISIONS REFERRED TO.

(See Interference, 22; Patentability, 2.)

FUNCTION.

(See Interference, 13; Motion to Dissolve Interference, 12.)

GRANT OF PATENT.

(See Invention, 4.)

PATENTS—EFFECT OF GRANT.

By the grant of a patent a patentee is merely put in a position to assert his *prima facie* right against infringers who may in their defense raise the question of the validity of the patent and have the same finally adjudicated in the light of a full presentation and consideration of all the evidence attainable in respect of anticipation, prior knowledge, use, and the like. [*In re* Thomson, 2756.

HARDSHIP.

(See Hearing; Trade-Marks, 11.)

HEARING.

(See Interference, 42.)

DURATION—DISCRETION OF EXAMINER.

Where upon petition that the Examiner be directed to hear further a party on motion in interference it appears that no hardship or irreparable injury will be suffered through the Examiner's refusal to hear, *Held* that the Examiner would not be controlled in the exercise of his discretion as to the duration of the hearing. [Moore *v.* Curtis, 324.

IDENTICAL CLAIMS.

(See Interference, 13.)

IDENTIFICATION OF APPLICATION.

(See Assignments, 1, 2.)

IDENTITY OF INVENTION.

(See Interference, 30, 32.)

INOPERATIVENESS.

(See Examination of Applications, 3; Rejection of Claims, 1.)

INTERFERENCE.

(See Appeal to the Commissioner of Patents; Priority of Invention; Testimony; Trade-Marks, 16, 18, 24, 25, 26, 33.)

1. MOTION TO AMEND—CONSIDERATION OF RIGHT TO MAKE PROPOSED CLAIMS.

Upon petition that the Examiner be directed to hear a party upon his opponent's motion to amend on the question of his opponent's right to make proposed claims, *Held* that petitioner may present his arguments upon motion for dissolution in case the proposed claims are admitted. [Moore *v.* Curtis, 324.

2. DISSOLUTION—FAILURE TO INCLUDE CLAIMS MADE BY BOTH PARTIES.

Failure to include in the issue certain claims made by both parties does not constitute an irregularity where such claims are not patentably different from those which were included. [Gally *v.* Burton, 325.

3. SAME—CLERICAL ERRORS DO NOT WARRANT DISSOLUTION.

The omission or improper use of hyphens in the counts of an issue and the use of the word "power" instead of the word *primary* are mere clerical errors, which may be corrected by a letter of the Primary Examiner calling attention to them, and they furnish no reason for dissolving the interference on the ground of irregularity in the declaration. [Id.

4. RIGHT TO MAKE CLAIM AND INTERFERENCE IN FACT CONFUSED.

The contention by an interlocutant that the opposing parties do not have a construction responding to certain language in the issue is one relating to the right to make the claim and not to interference in fact. [Carnell *v.* Glasgow *v.* Cook, 901.

5. OFFICE CANNOT COMPEL WITNESS TO ANSWER—SUPPRESSION OF TESTIMONY.

The testimony of a witness may be suppressed on account of his refusal to furnish material evidence; but the Office has no machinery for compelling him to furnish such evidence. [Lindstrom *v.* Lipschutz, 904.

6. STRIKING OUT ALLEGED SUPPLEMENTAL BRIEF.

Where at the hearing of a motion to compel a witness to answer certain questions or to suppress his deposition the interference was suspended for ten days to permit the parties to come to some agreement and a paper was thereafter filed in the case, in accordance with the agreement of counsel, to show that no agreement could be reached, *Held* that such paper will not be stricken out upon the allegation that it is a supplemental brief filed in violation of the rules. [Id.

7. EVIDENCE—CANNOT BE ADMITTED MERELY FOR INSPECTION OF OFFICE.

A letter which a party refused to introduce into evidence on the ground that it related to a secret invention cannot be filed in this Office merely for the inspection of the various tribunals who may consider the case. If the letter did not tend to affect the final judgment, there would be no reason for considering it, and if it did the opposing party would have a right to inspect and meet it as he might see fit. [Id.

8. MOTION FOR JUDGMENT ON RECORD—APPEAL.

Held that decisions of the Examiner of Interferences denying motions for judgment on the record should not be subject to review on appeal, as such decisions are not final determinations that judgment will not be rendered in favor of the moving parties. [Lemp *v.* Randall and Bates *v.* Thomson, 905.

9. SAME—SAME.

Denial of an appeal from decisions of the Examiner of Interferences refusing to render judgment on the record deprives the parties of no substantial right, while to permit appeals in such cases results in unnecessary delay, labor, and expense. [Id.

10. JUDGMENT ON RECORD.

Held that Rule 114 does not clearly and unmistakably require the Examiner of Interferences to render judgment against a party who has been called upon to show cause under that rule and who fails to take any action in response. [Id.

11. STAY OF PROCEEDINGS—UNWARRANTED APPEAL—MOTION BY PARTY IDENTIFIED IN INTEREST WITH APPELLANT.

When a party to an interference who has no substantial standing therein takes an unwarranted appeal, *Held* that another party thereto who is identified in interest with the first-mentioned party would not be granted a suspension of proceedings pending decision upon said appeal in prolongation of previous extensive delay. [Dalton *v.* Hopkins *v.* Newman, 906.

12. REOPENING A SECOND TIME—REFUSED.

Where the testimony in an interference refers to a certain exhibit which is not introduced in evidence, although its whereabouts is known, and the interference is reopened for the purpose of taking an additional deposition to properly connect such exhibit with the original testimony, the interference will not be reopened a second time because of the insufficiency of such deposition. [Autenrieth and Kane *v.* Sorensen, 1164.

13. BROAD ISSUE—INTERFERENCE IN FACT.

Where the claims of interfering parties are in identical language and each party has a construction responding in function to the broad terms thereof, there is an interference in fact, although the constructions are specifically different. [Gordon *v.* Wentworth, 1165.

14. APPEAL ON PRIORITY—CONSIDERATION OF PATENTABILITY.

Where a party who cannot prevail upon priority takes an appeal from the decision against him thereon merely for the purpose of attacking the patentability of the issue, *Held* that the appeal raises merely the question of priority, and the decision below must ordinarily be affirmed without consideration of the question of patentability, for the reasons given in *Sobey v. Holeclaw*, (119 O. G., 1922.) [Potter *v.* McIntosh, 1822.

15. SAME—SAME.

Whatever objections there may be to the policy and rule preventing appeal from decisions affirming patentability or right to make claims in those cases where affirmance may result in preventing the issue of a patent to a party who, in the event of a contrary decision, might have been entitled thereto, this policy and rule are believed to be in accordance with sound reason and unimpeachable in their application to cases where the would-be appellant upon patentability has in any event no standing before the Office as a claimant for a patent upon the matter in question. [Id.

16. SAME—SAME—STATEMENT OF EXAMINERS-IN-CHIEF.

Where in their decision on priority one Examiner-in-Chief found the issue to be patentable and another found it unpatentable and the third was absent, *Held* that the case is not distinguished in substance from one where all three found the issue unpatentable, since by their divided opinion they affirm the conclusion of the Primary Examiner that the issue is patentable. [Id.

17. PRIORITY.

Held that the controversy turned entirely upon the facts in evidence; that in addition to the burden imposed upon him by the patents regularly issued to Crone, Bauer has that of overcoming the effect of the successive adverse decisions in the Patent Office; that the evidence on behalf of Bauer is uncertain, fraught with suspicion, and cannot be accepted as sufficient proof of the facts essential to establish the appellant's averments either as originally made or as sought to be amended, and that the decision of the Commissioner must be affirmed. [*Bauer *v.* Crone, 1824.

18. ORIGINALITY.

Evidence considered and *Held* insufficient to clearly prove that the invention of the issue originated with French rather than Halcomb. [*French *v.* Halcomb, 1824.

19. BURDEN OF PROOF—APPLICANT *v.* PATENTEE.

An applicant in interference with a patent granted before the filing of the application has the burden of proving his case beyond a reasonable doubt, and this burden is not discharged where the testimony merely raises a doubt as to which of the two parties made the invention or whether a third party may not have contributed the essential idea which led to the invention. [*Id.

20. EVIDENCE OF INVENTOR PRACTICALLY UNCORROBORATED.

The statements in a memorandum of a note-book produced by French, one of the interfering parties, and alleged to disclose the invention in issue, *Held* insufficient to prove conception where it appears that the entry was seen by no one and there is no corroborative evidence on the point except a statement of another witness that French produced such a book at a given date. [*Id.

21. UNSUPPORTED TESTIMONY OF JOINT INVENTORS.

Where the only testimony taken by joint inventors upon the question of the date of their invention is their own depositions, *Held* that the depositions of parties to interference upon this point, unless corroborated by independent circumstances established by the evidence, are clearly insufficient to prove conception of the invention. (*Garrelle v. Freeman*, 103 O. G., 1683; 21 App. D. C., 207.) [*Podlesak and Podlesak *v.* McInnerney, 2127.

22. ORIGINALITY.

Where a party contended that he communicated the invention to his opponent, but did not claim to have made complete disclosure, and the circumstances did not support the theory of derivation, *Held* that the rule of *Winslow v. Austin* (86 O. G., 471; 14 App. D. C., 137) that the failure of a party to rebut the sworn statement of his adversary that he had fully disclosed the invention to him furnished strong evidence that the latter was not the prior inventor did not apply. [*Id.

23. PRIORITY.

Held that the Commissioner of Patents having found there was an interference in fact and that McInnerney had the right to make the claim could come to no other conclusion upon the proofs and the law applicable thereto than the one he did, and consequently his award of priority is correct if the remaining questions be decided in McInnerney's favor. [*Id.

24. RIGHT TO MAKE CLAIMS AND INTERFERENCE IN FACT—CONCURRENT DECISIONS IN PATENT OFFICE ORDINARILY CONCLUSIVE.

Where a question of interference in fact or right to make claims has been fully considered by the Primary Examiner, the Examiners-in-Chief, and the Commissioner and all have concurred in finding that a party to an interference has the right to make a claim which is the same as the count of the issue of an interference, *Held* that these conclusions will ordinarily be considered by the court as conclusive. [*Id.

25. RIGHT TO CLAIM—EFFECT OF INCORRECT DECISION.

If it be incorrectly held that a party to an interference has a right to make a claim in issue, an award of priority to him is made possible. His adversary would thereby be deprived of a substantial right in that he would be refused a claim where he was necessarily the prior inventor, his adversary never having made the invention. [*Id.

28. SAME—DECISION OF PRIMARY EXAMINER NOT FINAL—CONSIDERATION BY COURT OF APPEALS.

In view of the possible effect upon the determination of priority of an error in a decision holding that a party has a right to make a claim, *Held* that the latter question should not be finally

39. SAME—SAME—SAME—INVENTION AN ASSET.

It is to be presumed that an invention which is contested in interference proceedings is a valuable asset and that an inventor if without other means can ordinarily draw on this source, at least for means wherewith to file his application. If he fails to

8. SAME—RESOLVING DOUBTS.

Where there was doubt as to the sufficiency of the references

MOTION TO AMEND APPLICATION.

(See Interference, 1.)

26. SAME—DECISION OF PRIMARY EXAMINER NOT FINAL—CONSIDERATION BY COURT OF APPEALS.
In view of the possible effect upon the determination of priority of an error in a decision holding that a party has a right to make a claim, *Held* that the latter question should not be finally determined by the Primary Examiner who originally declared the interference and that the court would therefore take jurisdiction to determine that question as ancillary to that of priority. [*Id.

27. SAME LANGUAGE AND DIFFERENT INVENTIONS.
General terms may be used which apply equally to two structures which are not the same, as may be shown when those terms are read and construed in the light of the specifications behind them; but in most cases where two structures are not specifically the same and the art does not warrant a generic claim the language of the claims can be made precise and to fittingly describe each structure so that the use of identical language be avoided. [*Id.

28. SAME—AMENDMENT NECESSARY.
Where the claim read in the light of the specification of one party means one thing and the same claim read in the light of the specification of another party means another thing. *Held* that the same phraseology should not be employed. [*Id.

29. INTERPRETATION OF ISSUE.
The meaning given to the counts of an interference must be that intended by the party to the interference first making the claim (*Tracy* v. *Leslie*, 87 O. G., 891; 14 App. D. C., 126; *Auete* v. *Elwell*, 87 O. G., 2119; 15 App. D. C., 21.) [*Id.

30. CONSTRUED ISSUE—INAPPLICABLE TO CASES OF BOTH PARTIES—CASE REFERRED TO PATENT OFFICE UNDECIDED.
Where the issue if broadly construed read upon the devices of both parties, but consisted of a claim which had been allowed over a reference only upon a narrow construction inapplicable to the devices of one party, and it appeared that such construction of the claims was necessary in order to sustain the same, *Held* that, in the opinion of the court, an error had been committed and that the case should be remanded undecided to the Patent Office for further consideration as to identity of invention. [*Id.

31. NO INTERFERENCE IN FACT—RE-FORMATION OF CLAIMS IN ISSUE.
Held that apparently neither party is entitled to a claim for the feature in controversy which should dominate the other and that apparently the claims presented by both and made the issue should be so re-formed that each should have a specific claim, provided each could draw one to avoid the reference. [*Id.

32. CASE REMANDED UNDECIDED—FURTHER CONSIDERATION BY COURT.
In remanding the interference to the Patent Office undecided for further consideration of the question of identity of invention. *Held* that if after such consideration the Office adheres to the opinion that there is an interference in fact the present interference record with any additions will be further considered by the court. [*Id.

33. EVIDENCE—TESTIMONY OF ASSIGNEE.
Where a party depends for corroboration of his claims of conception and disclosure of the invention upon the testimony of his assignee and the character for veracity and the reliability of the assignee are unimpeached and the circumstances afford no reason for disbelieving the statements in the deposition of the assignee, *Held* that the corroboration is not rendered insufficient by the fact that the witness is the party's assignee. [Turnbull v. Curtis, 2442.

34. SAME—FAILURE TO CALL A WITNESS.
Where party claimed to have disclosed his invention to his solicitor, among others, and the solicitor was not put upon the stand, but it appears that the party was not certain of disclosure to the solicitor at the early date upon which disclosure was made to another witness who did testify, *Held* that the failure to call the solicitor as a witness was of no consequence. [Id.

35. SAME—NON-PRODUCTION OF SKETCHES.
Where sketches claimed to have been made by the inventor were not produced, but the inventor testified that the sketches were not made for preservation and were, in fact, not preserved, *Held* that no unfavorable inference should be drawn from their non-production. [Id.

36. PRIORITY—DILIGENCE—POVERTY—ENLISTING AID OR FILING APPLICATION.
The conceiver of an invention whose financial condition is such as to excuse him from any attempt unaided to actually reduce the invention to practice must, if he would hold the field, enlist the aid of others in actual reduction to practice or file an application for patent. [Id.

37. SAME—SAME—SAME—COMMERCIAL EXPLOITATION.
Where a party was in straitened financial condition, but his efforts during the period of delay in reducing to practice were directed toward commercial exploitation of his inventions generally, rather than toward securing the construction of the machine in issue or toward filing an application for patent thereon, *Held* that he was not reasonably diligent. [Id.

38. SAME—SAME—SAME—FILING APPLICATION.
The contention that a party could not file his application earlier than he did is rebutted by the fact that he filed or caused to be filed subsequent to his conception of the invention in issue and prior to the filing of his application in interference applications for patents upon six other inventions. [Id.

39. SAME—SAME—SAME—INVENTION AN ASSET.
It is to be presumed that an invention which is contested in interference proceedings is a valuable asset and that an inventor if without other means can ordinarily draw on this source, at least for means wherewith to file his application. If he fails to do so, he must show that the failure was unavoidable and after every reasonable effort in that direction had been exerted. [Id.

40. SAME—SAME—DELAY IN FAVOR OF RELATED INVENTION—EVIDENCE.
In order to bring his case within the doctrine of those cases where inventors were considered diligent who postponed the completion of their inventions in order to complete other devices intimately connected therewith, a party must produce evidence that his invention is not useful except in connection with the devices in whose favor the delay was made. Failing to do so, his opponent is relieved from the duty of producing evidence to the contrary, and the party cannot thereafter rely upon the absence of such evidence to the contrary to support the contention that the invention was not otherwise useful. [Id.

41. INTERFERENCE IN FACT—GENERIC ISSUE.
There may be an interference in fact on a generic issue based on two devices which are specifically different. [Kolb v. Hemingway v. Curtis, 2445.

42. PRACTICE UNDER RULE 105—SUFFICIENCY OF COPY TO BE DETERMINED BY PRIMARY EXAMINER—HEARING TO PARTIES.
Where a party files a copy of portions of his application for use in interference proceedings in an attempt to comply with Rule 105, the question of the sufficiency of the copy is a matter to be determined by the Primary Examiner in the first instance. In determining this question the Primary Examiner should fix a day upon which the parties may be heard and should render a decision upon the matter in issue. [Riker v. Law, 2754.

INTERLOCUTORY APPEALS.

(See Abandonment of Applications, 4; Trade Marks, 10, 11.)

INTERLOCUTORY PETITIONS.

(See Examination of Applications, 3.)

INVENTION.

(See Designs, 2, 3, 6.)

1. WATERPROOF CASING UPON ELECTROMAGNET.
Held that the provision of a waterproof casing upon an electromagnet which is to be used under water does not involve invention. [*Ex parte* Hayes, 901.

2. NON-MAGNETIC CASING UPON ELECTROMAGNET.
Held that the use of non-magnetic material for the casing of an electromagnet by one who does not claim to be the discoverer of the fact that magnetic material would interfere with the proper operation of the device cannot be regarded as patentable. [Id.

3. ANTICIPATION—INCASED ELECTROMAGNET.
An electromagnet having a waterproof casing of non-magnetic metal *Held* to be without patentable novelty, in view of a patent disclosing an electromagnet with a moisture-proof casing of non-magnetic material. [Id.

4. PATENTABILITY—AFFIDAVITS.
Held that affidavits going to show the practical success of the applicant's device where the truth thereof is substantially conceded are entitled to material weight in view of the fact that the grant of a patent confers no absolute right of property and in view of the customary rule of resolving ordinary doubts in favor of applicants. [*In re* Thomson, 2756

5. SAME—POPULARITY CONSEQUENTIAL ONLY WHEN NOVELTY IS IN DOUBT.
A patent should not be granted merely because a device or combination may possess great advantages, thereby bringing it into immediate use, as it is only when the question of novelty is in doubt that the fact that the device has gone into commercial use, displacing others employed for a like purpose or supplying the place of others whose intrinsic defects have prevented their general adoption and use, is sufficient to turn the scale in favor of invention. (*Potts* v. *Creager*, 70 O. G., 494; 155 U. S., 597, 609.) [*Id.

6. SAME—COMBINATION—PRIOR COMBINATION DIFFERENT.
Where the applicant claimed a combination of old elements and a reference shows a combination which is intended for a different use and which involves differences of operation and one of the elements shown in the reference is different from the corresponding element in the applicant's device, *Held* that a patent should not necessarily be refused on account of such reference. [*Id.

7. SAME—SAME—SAME.
Where a prior combination cited against the combination claimed includes elements in addition to those used by the applicant which result in differences in operation undesirable for the purposes of the applicant's device and one of the elements of the prior combination is different from the corresponding element of the applicant's combination, *Held* that a patent should not necessarily be refused on account of the prior combination. [*Id.

8. SAME—RESOLVING DOUBTS.
Where there was doubt as to the sufficiency of the references and the applicant demonstrated that he had produced an apparatus of great utility, *Held* that the doubt should be resolved in favor of the applicant's claim [*Id.

1. INTERFERENCE—APPEAL ON PRIORITY—MOTION TO TRANSMIT MOTION TO DISSOLVE NOT GRANTED.
Where the grounds for dissolution specified in Rule 122 were raised at the proper time and decided by the Primary Examiner and by the Examiners-in-Chief on appeal and the case is appealed to the Commissioner from a decision of the Examiners-in-Chief on the question of priority, a motion to transmit the interference to the Primary Examiner to consider the question of patentability will not be granted unless a clear and unmistakable error appears in the prior decisions. [Parkes v. Lewis, 323.

2. SAME—DELAY IN BRINGING—EXCUSES.
Where excuses offered for delay in bringing motion for dissolution do not cover the period in which the motion should have been brought or some of the subsequent period, but apply only to the latter portion of the subsequent period, *Held* that the motion should not be transmitted. [McKee v. Baker, 657.

3. SAME—SAME—SAME.
Where it is not shown that a party went diligently to work upon his case at the proper time to discover whether a motion for dissolution should be brought nor that he was prevented from making the necessary investigation and bringing the motion within the period fixed by the rules, *Held* that the motion should not be transmitted. [Id.

4. SAME—SAME—SAME.
The rule requiring motions to be brought within a fixed time is a wholesome one, and its enforcement requires that motions be not accepted when brought after the expiration of that time except where circumstances are shown which made it impossible to bring the motion within the regular period or under which the party could not reasonably be expected to have brought it therein. [Id.

5. SAME—STATEMENTS OF FACTS—TRANSMISSION
Where nothing in the statement of the facts upon which a motion to dissolve on the ground of irregularity in declaration was based is directed to anything other than the patentability of claims, the rights of the parties to make claims, or the identity in meaning of claims when read in the respective cases, *Held* that the motion was properly refused transmission as to this ground. [Klepetko v. Becker, 658.

6. SAME—SAME—SAME.
Where no facts are alleged in support of a motion for dissolution on the ground of non-patentability except such as relate to the right of a party to make claims, *Held* that the motion was properly refused transmission as to the ground of non-patentability. [Id.

7. SAME—SAME—SAME.
In order to restrict, so far as possible, the labor of investigation and consideration on the part of the Office and on the part of the parties against whom motions for dissolution are brought to the exact matters by reason of which the moving party believes the interference should be dissolved, it is believed that the motion should set forth the specific facts relied upon to show that the interference should not continue. [Id.

8. SAME—SAME—SAME.
In setting forth facts in motions for dissolution the distinctions between the general grounds of dissolution which have been pointed out in *Woodward* v. *Newton*, (86 O. G., 492,) *Owens* v. *Richardson*, (111 O. G., 1037,) and *Kecsmeker* v. *Hodges and Hodges* (118 O. G., 836) must be carefully observed. The observance of these distinctions is necessary to the logical presentation of the questions raised and to the avoidance of confusion in the matter of appeals. [Id.

9. SAME—SAME—SAME.
Where the motion does not state facts of such nature as might form proper basis for dissolution upon the general ground upon which the facts are alleged, the motion is not sufficiently clear and definite, and it should not be transmitted as to those grounds to which such objections apply. [Id.

10. DISSOLUTION—APPEAL ON MOTION—RIGHT TO CLAIM NOT CONSIDERED UNDER HEAD OF INTERFERENCE IN FACT.
Where it is contended upon appeal on motion to dissolve for non-interference in fact that a party has no right to make claims, *Held* that the question of right to make claims is different from that of interference in fact and will not be considered of such on appeal. (*Blackmore* v. *Hall*, 119 O. G., 2523.)
[Heintzelman and Camp v. Vraalstad and Doyle, 906.

11. INTERFERENCE IN FACT.
Where, so far as the invention in issue is concerned, the same results are accomplished by substantially the same or equivalent means in the device of each party and the terms of the issue have the same meaning in each case, *Held* that there is interference in fact. [Id.

12. SAME—EFFECT OF DIFFERENCES IN THE DEVICES NOT INVOLVED IN THE ISSUE.

12. SAME—EFFECT OF DIFFERENCES IN THE DEVICES NOT INVOLVED IN THE ISSUE.
Where it is contended upon appeal on motion to dissolve for non-interference in fact that, in view of functions effected in appellees' apparatus which it is claimed are not effected in that of the appellants, the inventions claimed by the respective parties are essentially different, *Held* that the differences in function referred to related to specific differences in the devices to which the issue is limited and formed no basis for dissolution of the interference. (*Townsend* v. *Copeland* v. *Robinson*, 119 O. G., 2523.) [Id.

PATENTABILITY.

(See Appeal to the Examiners-in-Chief, 2; Designs, 2, 3, 5; Interference, 14, 15; Invention; Motion to Dissolve Interference, 5, 6; Rejection of Claims, 2; Testimony, 1.)

1. DOUBLE USE—SUBSTITUTION OF EQUIVALENTS.
Where in a rock-crusher a mantle removably secured upon a conical core is concededly unpatentable, *Held* that the provision of old pin-and-slot fastening devices for retaining the mantle tightly upon the conical core is mere double use and, in view of certain references, an obvious substitution of equivalents.
[*In re* Thurston, 1166.

2. SAME—SAME.
In denying patentability to a change in prior devices, *Held* that the change was not made by transferring an old device to use in an entirely different and unrelated art and that therefore the case of *Potts* v. *Creager* (70 O. G., 494; 155 U. S., 597) does not apply. [Id.

3. POPULARITY—LARGE SALES.
Where the assertion was made that the new machine had met with instant favor and large sales, but there was nothing in the record to bear out the assertion, *Held* that no effect could be given thereto. [Id.

4. RULES AS TO DOUBTS.
Where there is a serious doubt as to patentability, that doubt should be resolved in favor of the one seeking a patent, for if his claim be denied he has nothing with which he can go into court and attempt to enforce a lawful monopoly; but in reversing the concurrent decisions of the Patent Office there should be conviction beyond a reasonable doubt that in the absence of anything but what is shown by the record a patent granted on the application would be held a valid one.
[*In re* Schraubstadter, 1167.

PATENTS AND APPLICATIONS.

(See Access to Pending Applications.)

PENDING APPLICATIONS.

(See Trade-Marks, 2, 3, 4, 5, 25.)

PETITION TO THE COMMISSIONER OF PATENTS.

(See Abandonment of Application.)

POVERTY.

(See Interference, 36, 37.)

PRELIMINARY STATEMENT.

(See Amendments to Preliminary Statements; Priority of Invention, 1.)

PRIOR APPLICATION.

(See Access to Pending Applications.)

PRIORITY OF INVENTION.

(See Interference, 14, 15, 16, 17, 18, 19, 22, 23, 25, 26, 36, 37, 38, 39, 40; Motion to Dissolve Interference.)

1. INTERFERENCE—JUDGMENT ON THE RECORD.
Where the preliminary statement of N. and T. failed to overcome the record date of O.'s application and motion by N. and T. to amend their preliminary statement had been denied and the denial affirmed on appeal, *Held* that O. is entitled to an award of priority of invention.
[Neth and Tamplin v. Ohmer, 323.

2. SAME—ORIGINALITY—DERIVATION BY S. FROM B. THROUGH ANOTHER—EVIDENCE.
Where B. claims conception of the invention and disclosure to an associate of S. prior to S.'s alleged date of conception and is corroborated as to both matters by credible witnesses and the associate is discredited by his denial that the invention was so disclosed to him and the weight of circumstances is in favor of derivation by S. from B. through the associate, *Held* that the testimony of S. and the associate to independent invention by S. and the inference unfavorable to B. from inactivity in connection with the invention are overcome and that B. is entitled to an award of priority of invention.
[Beall v. Shuman, 655.

3. SAME—SAME—EVIDENCE—SIMILARITY OF INVENTION AND OPPORTUNITY OF DERIVATION.
Held that the mere appearance of two parties with the same invention identical in many novel and distinct details raises some suspicion of derivation by one from the other, and where one of these parties is proved to have been in possession of the invention prior to any date of possession proved by the other party and it is shown that opportunity for derivation by the later party from the earlier party occurred prior to such proved date of possession by the later party the suspicion of derivation, in the absence of satisfactory evidence to the contrary, becomes conviction, and it must be held that the later party did, in fact, obtain the invention from the earlier party.
[Id.

4. SAME—SAME—SAME—INACTIVITY OF PARTY—NOTICE OF ADVERSE CLAIM.
Where B. was not active in obtaining patents or in the reduction to practice and promotion of the invention which was carried on by S., but produces evidence in support of his claim that he supposed S. to be carrying out B.'s conception in the business of the common employer of B. and S., *Held* that in the absence of proof that B. in the period of his inactivity had notice of S.'s adverse claim no inferences strongly unfavorable to B. can be drawn from his inactivity. [Id.

5. SAME—EVIDENCE—DISCREPANCY BETWEEN TESTIMONY AND APPLICATION AS TO EXTENT OF THE INVENTION.
Where B. carefully omitted from his applications, prepared from S.'s patents, features of invention disclosed in the patents to S. and which B. in testifying claims to have invented, *Held* that the inference from these facts that B. did not originate the inventions in issue is too remote to stand against satisfactory evidence that B. did originate the invention in issue. [Id.

PROSECUTION OF APPLICATION BY ASSIGNEE.

PROSECUTION BY ASSIGNEES OF PART INTEREST—INVENTOR MISSING.
Where assignees of half interest petition for permission to prosecute the case, alleging that inventor has disappeared, and it appears that the inventor has a habit of absenting himself, and the application has not been acted upon by the Office, *Held* that the petition is premature and may be renewed in case it shall appear to be necessary to permit prosecution by the assignees to save the case from abandonment.
[*Ex parte* Fitzhugh, 660.

REGISTRATION.

(See Acts of 1881 and 1905; Description of Goods; Trade-Marks, 12, 13, 14, 15, 19, 23.)

REISSUE.

PRIOR EX PARTE DECISION BY APPELLATE TRIBUNAL—NOT BINDING ON PRIMARY EXAMINER ON INTER PARTES CONSIDERATION.
An *ex parte* decision on the question of new matter in a reissue application is not absolutely binding on the Primary Examiner when the question is raised *inter partes* on a motion to dissolve; but it should be persuasive. If the *inter partes* consideration of the case does not bring out new reasons or new phases of the old reasons or such new light as would reasonably tend to change the decision by the appellate tribunal, then such decision should be followed. [Felsing v. Nelson, 2445.

REJECTION OF CLAIMS.

(See Abandonment of Applications, 1; Examination of Applications, 3; Reopening of Rejected Cases, 2, 3.)

1. APPEAL—INOPERATIVENESS.
Where claims are rejected on the ground of inoperativeness, the applicant's remedy is by appeal to the Examiners-in-Chief and not by petition. [*Ex parte* Davidson, 2753.

2. REJECTION—AGGREGATION CLAIMS—SEPARATE FEATURES MAY BE FOUND IN DIFFERENT REFERENCES.
Where claims are considered to be aggregations, it is not necessary to a valid rejection thereof that all the features specified in the claims shall be found in a single reference. A rejection for lack of patentable novelty in view of the prior art calls for a general view of the prior art. This general view can be obtained only by looking at each reference cited in the light of the disclosure contained in the other references. It is the knowledge of the public derived not from one patent alone, but from all, which negatives patentable novelty in any case.
[*Ex parte* Sindlingchristensen, 2755.

REOPENING OF INTERFERENCE.

(See Interference, 12.)

REOPENING OF REJECTED CASES.

(See Amendment After Final Rejection.)

1. REOPENING EX PARTE CASE—ALLEGED STATEMENT OF NEW REASONS FOR REJECTION BY EXAMINER.
Where antedating affidavits under Rule 75 to overcome one of several references are filed after final rejection and in refusing consideration to such affidavits the Examiner states that the rejection could be sustained on the references other than the one attempted to be overcome, *Held* that this statement of the Examiner is not a statement of new reasons for rejection and does not operate to reopen the case. [*Ex parte* Berg, 903.

2. AFFIDAVITS—FILED AFTER FINAL REJECTION AND DECISION ON APPEAL.
Where affidavits are presented after final rejection of the claims and decision by the Examiners-in-Chief on appeal purporting to show that the rejection of the claims was improper and it is alleged that the affidavits are based upon experiments made after the decision of the Examiners-in-Chief, *Held* that the experiments should have been made and the affidavits filed before the case was closed before the Primary Examiner and that the affidavits would not be admitted.
[*Ex parte* Richmond, 905.

3. NEW EVIDENCE—SHOWING REQUIRED.
Where the party fails to make his demonstration and to submit his evidence in response to the original rejection before prosecuting his case to final rejection, the case will not thereafter be reopened except upon showing of good and sufficient reasons why the evidence whose admission is sought was not earlier presented. [Id.

STAY OF PROCEEDINGS.

(See Interference, 11.)

SUPERVISORY AUTHORITY OF THE SECRETARY OF THE INTERIOR OVER THE COMMISSIONER OF PATENTS.

DISMISSAL OF APPEAL A QUASI-JUDICIAL DETERMINATION.
Where the Commissioner dismissed an appeal from the decision of the Primary Examiner denying a motion to dissolve an interference on the ground that the appeal, though alleging appealable grounds, only sought consideration of non-appealable questions, *Held* that the decision of the Commissioner was a quasi-judicial determination which bears more or less directly upon the merits of the controversy and presents a question over which the Secretary of the Interior has no supervisory jurisdiction by appeal or otherwise. (See *Butterworth* v. *Hoe*, 29 O. G., 615; 112 U. S., 50, and *Poole* v. *Avery*, 87 O. G., 357; 14 *Assistant Attorneys-General Opinions*, 177.) [†Blackmore v. Hall, 1477

SUPPLEMENTAL BRIEF.

(See Interference, 6.)

SUPPRESSION OF TESTIMONY.

(See Interference, 5, 6.)

TEN-YEARS CLAUSE.

(See Trade-Marks, 1.)

TESTIMONY.

(See Interference, 5, 12, 19, 21, 33.)

1. REBUTTAL RELATING TO PATENTABILITY STRICKEN OUT.
Rebuttal testimony which related solely to the patentability of the issue *Held* to have been properly stricken out.
[Parkes v. Lewis, 223.

2. LEADING QUESTIONS.
Where some leading questions were asked in the course of the examination of witnesses, *Held* that their testimony as a whole

16. LACK OF INTERFERENCE—"OLD JAY" AND "OLD CROW."
A mark consisting of "Old Jay" and the representation of a jay does not so nearly resemble the words "Old Crow" and the

30. OPPOSITION—"HENDERSON" NOT REFUSED ON "ANDERSON."
A trade-mark including the word "Henderson" is not

34. ASSOCIATED REPRESENTATIONS OF ANCHOR AND SEA-MON-

2. LEADING QUESTIONS.
Where some leading questions were asked in the course of the examination of witnesses, *Held* that their testimony as a whole was, nevertheless, sufficiently free from dependence upon the suggestion of counsel to be entitled to acceptance without diminution of weight on account of this objection.
[Beall v. Shuman, 655.

TRADE-MARKS.

(See Acts of 1881 and 1905; Description of Goods.)

1. COAT OF ARMS—"TEN-YEARS" CLAUSE.
The coat of arms of the United States is not registrable as a trade-mark even under the "ten-years" clause of the law.
[*Ex parte* American Glue Company, 324.

2. "PENDING" CASES—REJECTION BY EXAMINER.
A trade-mark application is not to be regarded as adjudicated and as not "pending" within the meaning of sections 14 and 24 of the act of 1905 merely because it had been rejected by the Examiner.
[*Ex parte* Griserin-Werke Paul Camphausen G. M. B. H., 327.

3. SAME—SAME—FINAL ADJUDICATION.
The mere rejection by the Examiner of a trade-mark application under the act of 1881 did not finally dispose of it, since it was subject to amendment and reconsideration if request therefor were made within a reasonable time. [Id.

4. SAME—APPEAL—UNREASONABLE DELAY.
While a trade-mark application is not taken out of the class of pending cases merely because it has been rejected, it is taken out of that class where the right of appeal was exhausted and where there has been unreasonable delay in prosecuting the application. [Id.

5. SAME—ABANDONMENT.
Where after rejection the trade-mark applicant abandoned all intention of further prosecuting the case, it was not a live or pending case, but was abandoned. [Id.

6. SAME—DELAY IN PROSECUTION—EVIDENCE OF ABANDONMENT.
Failure to take any action in prosecution of an application for a long period of time is evidence of an intention to abandon the application and in the absence of proof to the contrary is to be taken as establishing the fact. [Id.

7. SAME—LACHES—APPLICATION NOT NOTICE.
An application for the registration of a trade-mark is not notice to the public through this Office of the applicant's claim of ownership unless that application is prosecuted with reasonable diligence. The application is abandoned by laches. [Id.

8. SAME—DELAY OF ONE YEAR UNREASONABLE.
No hard and fast rule can be laid down as to what delay will be regarded as an abandonment of a trade-mark application: but ordinarily a delay for more than one year will be deemed unreasonable unless excuse is made therefor. [Id.

9. ANTICIPATION—"GRISERIN" AND "ELECTRENE."
The trade-mark "Griserin" does not so nearly resemble the mark "Electrene" as to deceive purchasers. [Id.

10. OPPOSITION—APPEAL UPON INTERLOCUTORY ORDER—PLEADINGS.
Where exception taken to applicant's answer on ground of impertinence was overruled by Examiner of Interferences, *Held* that no appeal from this action would be entertained.
[Whittingham v. Automatic Switch Company, 659.

11. SAME—SAME—SAME.
In overruling the exceptions to the answer the Examiner of Interferences denied to opponent no substantial rights, nor is it understood wherein opponent would be subjected to hardships by erroneous decisions of the Examiner overruling such exceptions sufficient to justify the general hardship in delay, labor, and expense which would be imposed upon parties by permitting interlocutory appeals in these cases. [Id.

12. PUBLICATION—REJECTION THEREAFTER WITHOUT OPPOSITION.
The Examiner may refuse registration after the publication of a trade-mark under section 6 of the Trade-Mark Act even where no notice of opposition is filed.
[*Ex parte* Cluett, Peabody & Company, 902.

13. SAME—SECTION 6 CONSTRUED—PERMISSIVE, NOT MANDATORY.
The provision in section 6 of the act that the Commissioner "shall issue a certificate of registration" in case no notice of opposition is filed is permissive and is not mandatory. [Id.

14. SAME—SAME—RIGHT TO REJECT—INTENT.
Section 6 was intended to provide an additional means for determining the right of the applicant to registration, and not for the purpose of cutting off the right of the Office to consider and act upon any and all legitimate questions as to the applicant's right. [Id.

15. SAME—SAME—CONSIDERATION OF EVIDENCE.
It was not the intent of section 6 that this Office should reject an applicant upon evidence presented by one opposing and disregard the same evidence if discovered by its own efforts. [Id.

16. LACK OF INTERFERENCE—"OLD JAY" AND "OLD CROW."
A mark consisting of "Old Jay" and the representation of a jay does not so nearly resemble the words "Old Crow" and the representation of a crow as to mislead the public or deceive purchasers.
[W. A. Gaines & Co. v. Carlton Importation Co., 902.

17. CONSTITUTIONALITY OF LAW—QUESTION FOR COURTS.
The question as to the constitutionality of the trade-mark law will not be determined upon opposition to the registration of a trade-mark, but will be left to the courts for determination. [Id.

18. LACK OF IDENTITY—"RAVEN VALLEY" AND "OLD CROW."
Registration of a mark consisting of the words "Raven Valley" and the representation of three ravens is not to be refused because of the prior use by another of the words "Old Crow" and the picture of a crow. The marks are not so nearly alike as to deceive purchasers.
[W. A. Gaines and Company v. C. A. Knecht and Son, 1163.

19. OPPOSITION—SUFFICIENCY OF ANSWER.
Where opposition is made to the registration of a trade-mark and the applicant is called upon to make answer within a certain time and he does within that time file a paper entitled a demurrer, setting forth reasons which the Office regards as sufficient for dismissing the opposition, *Held* that he has complied with the Office requirement for an answer. [Id.

20. SAME—PLEADINGS—TECHNICAL FORMS NOT INSISTED UPON.
Technical and refined objections to the form of pleadings in trade-mark oppositions will not be sustained. It is sufficient if the parties present to the Office the material which will enable it to properly dispose of the case on its merits, and it is not necessary to insist upon technical forms. [Id.

21. CONSTITUTIONALITY OF ACT OF 1905—MATTER FOR COURTS.
The question whether the Trade-Mark Act of February 20, 1905, is unconstitutional will not be entertained or determined by the Patent Office, but will be left for determination by the courts. The Office will perform the duties imposed by the act, leaving to the courts the question as to the validity of the registrations made thereunder. [Id.

22. PARTICULAR DESCRIPTION OF GOODS—STATUTORY REQUIREMENT.
The statute requires that the applicant specify the particular goods upon which his mark has been used and not merely the class of goods. The term "meats" gives the class, but not the particular goods and is not sufficiently definite.
[*Ex parte* The Kingan Packing Association, 1165.

23. DIVISION—GOODS OF THE SAME DESCRIPTIVE PROPERTIES.
Only one trade-mark right should be covered by a single registration, and where the statement of the goods to which the mark has been applied is so broad as to include goods which are not of substantially the same descriptive properties registration will be refused. [Id.

24. APPEAL TO COURT—INTERFERENCE DECLARED UNDER ACT OF 1881.
A trade-mark interference declared under the act of 1881, but not decided until after the passage of the act of February 20, 1905, is appealable to the Court of Appeals of the District of Columbia under the act of February 20, 1905, where the only application involved has been amended to bring it under the provisions of that act.
[*Giles Remedy Company v. Giles, 1826.

25. SAME—PENDING APPLICATION.
A trade-mark application which was involved in an interference at the time of the passage of the act of February 20, 1905, was a pending application such as might be amended to bring it under the act. [*Id.

26. INTERFERENCE—PRIORITY OF ADOPTION AND USE.
Where it appears that Sanford Giles first adopted and used the trade-mark and secured registration thereof and subsequently the mark was used by him and by Daniel Giles at a single place of business under the name of the Giles Remedy Company until a disagreement between them which resulted in their separation, *Held* that Sanford Giles was the owner of the mark and that judgment of priority must be in his favor. [*Id.

27. SAME—SAME—RIGHT ACQUIRED BY TRANSFER.
Where a trade-mark registrant is shown to have been the first to adopt and use the mark and to have been the owner at the time he secured the registration, he is not to be defeated in an interference by showing that his opponent subsequently acquired title to the mark from him. Such showing might in appropriate proceedings justify compelling the transfer of the certificate of registration; but it does not justify the holding that the later applicant was the first to adopt and use the mark. [*Id.

28. OWNERSHIP BY PARTNERS—RIGHTS UPON DISSOLUTION.
The general rule that when a partner retires from a partnership and assents to the retention by the other partners of the possession of the old place of business and the future conduct of the business by them under the old name the trade-mark remains with the latter has no application to the facts of this case. [*Id.

29. SAME—SAME—WITHDRAWAL OF MEMBER.
In the absence of express agreement a trade-mark used theretofore by one who enters into partnership with others does not at the dissolution of the partnership, caused by the withdrawal of the member bringing the mark into the partnership, remain the property of the partnership. [*Id.

30. OPPOSITION—"HENDERSON" NOT REFUSED ON "ANDERSON."
A trade-mark including the word "Henderson" is not to be refused registration because an entirely different mark including the word "Anderson" had been used previously by another upon the same class of goods.
[Buchanan-Anderson-Nelson Company v. Breen & Kennedy, 2125.

31. OPPOSITION FILED TOO LATE—OFFICE WITHOUT JURISDICTION.
This Office has no authority to entertain a notice of opposition to the registration of a trade-mark filed more than thirty days after the publication of the mark.
[Winand v. P. J. Drury Company, 2126.

32. OPPOSITION TO REGISTERED MARK—MOOT QUESTION.
Where opposition is made to the registration of a mark and it appears that the mark has been registered, the opposition will be dismissed as raising a moot question. [Id.

33. INTERFERENCE—"OLD JAY" AND "BLUE JAY."
There is such a close resemblance between a mark consisting of the words "Old J" or "Old Jay Rye" in connection with a representation of a blue-jay and the words "Blue Jay" as to cause confusion and bring about a conflict of rights.
[W. H. Jones & Co. v. Carlton Importation Company, 2444.

34. ASSOCIATED REPRESENTATIONS OF ANCHOR AND SEA-MONSTER—ANTICIPATION.
A trade-mark consisting of the representation of a sea-monster associated with an anchor represented as standing vertically upon its point and having the head of the sea-monster protruding from between the anchor-arms and the body of the sea-monster entwined spirail yabout the shank of the anchor, *Held* not registrable in view of the prior registration of a trade-mark consisting of an anchor and the arbitrarily-selected word "Anchor" placed across said representation.
[*Ex parte* Gwinn Bros. & Co., 2755.

Ahlgrim, Charles, *et al.* (See McDonner, Charley, assignor.)						
Aicher, George E., *et al.* (See Mitchell, Ira G., assignor.)						
Aiken, Edward L., East Orange, assignor to New Jersey Patent Company, West Orange, N. J. Repeating attachment for phonographs	810,018	Jan. 16	2826	584–5	120	704
Ainley, Emmett. (See Leffort, William M., assignor.)						
Akers, Henry H., assignor to O. B. Akers, Cherryvale, Kans. Mail-bag catcher and deliverer	812,471	Feb. 13	1911	421–2	120	1955
Akers, Ora B. (See Akers, Henry H., assignor.)						
Akers, William M., and B. F. Huston, Decatur, Iowa. Building-wall construction	811,534	Feb. 6	3	1	120	1485
Aktiebolaget L. M. Ericsson & Co. (See Johansson, Hemming, assignor.)						
Aktiebolaget Separator. (See Ljungström, Fredrik, assignor.)						
Alaska Codfish Co. (See Whitman, Victor, assignor.)						
Albers, Josef, Aix-la-Chapelle, Germany. Protective cover for pneumatic tires	813,934	Feb. 27	4821	1064	120	2680
Alden, Louis, Jr., Bryn Mawr, Pa. Can-opener	811,894	Feb. 6	691	151	120	1631
Aldrich, Alonzo, Beloit, Wis. Paper-making machine	811,527	Jan 30	5867	1230	120	1430
Alexander, Frank P., Ludington, Mich. String musical instrument	808,802	Jan. 2	358	77	120	80
Alexander, Julius A., Pine Bluffs, Ark. Hame	810,383	Jan. 23	3627	747	120	909
Alexander, Robert L., Moral, assignor of one-half to A. Coleman, McComb, Okla. Ter. Rail-joint	809,238	Jan. 2	1252	255	120	276
Alexander, Sidney A., Meriden, Conn. Parquet-flooring	812,320	Feb. 13	1636	360	120	1809
Alexander, Tony, Brookhaven, Miss. Level	812,261	Feb. 13	1492	326	120	1865
Alexander, William J., *et al.* (See McCarl, Joseph C., assignor.)						
Allbright, William B., Chicago, Ill. Filter-plate	813,395	Feb. 27	3759	826	120	2449
Allen, Aaron B., Pueblo, Colo. Nut-lock	813,031	Feb. 20	3017	664	120	2232
Allen, Arthur S., Brookline, assignor to United Printing Machinery Company, Boston, Mass. Leveler for forms of type	811,254	Jan. 30	5565	1161	120	1368
Allen, Charles M. (See Baggaley, Allen, and Lindquist.)						
Allen, Charles M., Lolo, Mont. Saving metal values from slag	810,364	Jan. 16	3563	733	120	863
Allen, Charles M., Lolo, Mont., assignor to R. Baggaley, Pittsburg, Pa. Converting matte	808,618	Jan. 2	1	1	120	3
Allen, Clarence L., assignor to Cotton Collar Company, Atlanta, Ga. Horse-collar	809,886	Jan. 9	2535	526	120	591
Allen, Jacob S., Jr., Philadelphia, Pa. Derrick	810,691	Jan. 23	4241	878–9	120	1048
Allen, James B. (See Bryant and Allen.)						
Allen, John H. (See Campbell, John C., assignor.)						
Allen, Matthew F., Nashville, Tenn. Range construction	809,766	Jan. 9	2328	481–2	120	544
Allen, Oliver C., Greenfield, Ind. Cross-arm construction for telegraph-poles, &c.	811,895	Feb. 6	693	151	120	1631
Allen, Thomas G., London, England. Moter-car for preventing side slip	813,664	Feb. 27	4322	951	120	2574
Allen, Uriah C., Sandyhill, N. Y. Treating waste fiber	811,896	Feb. 6	694	151–2	120	1632
Allen, William C., Gurley, Ala. Pneumatic grain-elevator	813,073	Feb. 20	3106	680	120	2264
Allen, William D., and C. F. Bowes, assignors to W. D. Allen Manufacturing Company, Chicago, Ill. Hose-rack	811,686	Feb. 6	293	66	120	1550
Alliance Machine Company. (See Shem, George W., assignor.)						
Allis-Chalmers Company. (See Martin, Ludolph P., assignor.)						
Allis-Chalmers Company. (See Reynolds, Edwin, assignor.)						
Allison, Andrew J., Mount Sylvan, Tex. Driving mechanism	810,217	Jan. 16	3468	716	120	849
Allison, James J., Rockfalls, Ill. Stopper for bottles	811,811	Feb. 6	820	116	120	1588
Allison, Robert B., Topeka, Kans. Shingling-hatchet	810,597	Jan. 23	4076	840	120	1019
Allsbouse, J. Irving, *et al.* (See Howard, James, assignor.)						
Allwardt, Morris H., Jordan Valley, Oreg. Hay-net	812,262	Feb. 13	1498	336–7	120	1865
Alpert, William, Richardton, N. D. Match-box	812,714	Feb. 13	2080	895	120	2080
Alrite Duplicating Supply Company. (See Hilliker, George L., assignor.)						
Alsobrook, James C., Sorrento, Fla. Animal-trap	812,472	Feb. 13	1914	422	120	1956
Alsop Process Company. (See Mitchell, John E., assignor.)						
Alspach, Alpheus J., Chicago, Ohio. Combined step-ladder and ironing-table	809,926	Jan. 16	2331	544	120	663
Althaus, Frederick D., New York, N. Y. Ration-engine	812,176	Feb. 13	1341	291–3	120	1831
Altmann, Charles P., Lyon, France. Steam-generator	813,133	Feb. 20	3239	710	120	2263
Altschul, Julius, assignor to Actien-Gesellschaft für Anilin Fabrikation, Berlin, Germany. Making silk fibroin peptone	813,272	Feb. 20	3498	.....	120	2334
Aluminum Manufacturing Company. (See Kummerow, Adolph, assignor.)						
Aluminum Press Company. (See Claridge and Randall, assignors.)						
Ambrose, Harry T. (See Donning, George W., assignor.)						
Amendt, Christian, Latrobe, Pa. Self-centering dividers	809,887	Jan. 9	2536	526	120	591
America Company. (See Sutton, William S., assignor.)						
American Absorbent Fiber Company. (See Green, Willard R., assignor.)						
American Blower Company. (See Treat, Charles H., assignor.)						
American Borax Company. (See Blumenberg, Henry, Jr., assignor.)						
American Brake Company. (See Barlow, George D., assignor.)						
American Brake Company. (See Reinhart, Charles, assignor.)						
American Brake Company. (See Stambaugh, Francis M., assignor.)						
American Can Company. (See Lots, Augustus, assignor.)						
American Can Company. (See Macarthy, Henry, assignor.)						
American Can Company. (See Marcuse, Isaac J., assignor.)						
American Can Company. (See Sharp, Lee C., assignor.)						
American Can Company. (See Williams, Harry B., assignor.)						
American Car & Foundry Company. (See Ostrander, Allen E., assignor.)						
American Car Strap Advertising Company. (See Collins, John S., assignor.)						
American Cigar Company. (See Richards, Francis H., assignor.)						
American Column Company. (See Treadder, John J., assignor.)						
American Compressed Air Supplying Company. (See Palm, John V. O., assignor.)						
American Electric Brake Company. (See Mahoney, Joseph N., assignor.)						
American Electric Telephone Company. (See Carlisa, Albert, assignor.)						
American Electric Telephone Company. (See Olsen, Halvor M., assignor.)						
American Electric Telephone Company. (See Setter, Michael, assignor.)						
American Electromobile Company. (See Rae, Frank B., assignor.)						
American Graphophone Company. (See Manwaring, George A., assignor.)						
American Heel Machine Company. (See Wolfe, William, assignor.) (Reissue.)						
American Locomotive Company. (See Cole, Francis J., assignor.)						
American Meter Company. (See McDonald and Scofield, assignors.)						
American Multigraph Company. (See Gammeter, Harry C., assignor.)						
American Optical Company. (See Coates, Walter A., assignor.)						
American Paper Bottle Company. (See Kinsey, James C., assignor.)						
American Paper Bottle Company. (See Kinsey and Heyl, assignors.)						
American Patent Promotion Company. (See Wilkes, Thomas E., assignor.)						
American Pulley Company. (See Brinley, Charles A., assignor.)						
American Road Machine Company. (See Phillips, Edwin S., assignor.)						
American Rotary Engine Company. (See Porter and Whiting, assignors.)

American Seeding Machine Company. (See Packham and Oates, assignors.)						
American Serial Lock Company. (See Townsend, Harry P., assignor.)						
American Sheet & Tin Plate Company. (See Bray, Charles W., assignor.)						
American Sheet and Tin Plate Company. (See Mora, Fritz C., assignor.)						
American Sintering Company. (See Davison, George L., assignor.)						
American Specialty Company. (See Cioffi and Case, assignors.)						
American Steel & Wire Company of New Jersey. (See Backlin and Eklund, assignors.)						
American Suction Gas Producer Company. (See Sandner, Erich, assignor.)						
American Turpentine and Tar Company. (See Gilmer, George O., assignor.)						
American Type Founders Company. (See Benton, Linn B., assignor.)						
American Water Softener Company. (See Spencer, Ira H., assignor.)						
American Wire Cloth Company. (See Christian and Reynolds, assignors.)						
Ammerman, William M., assignor to Edwin J. Toof Company, New Haven, Conn. Sewing-machine	809,600	Jan. 9	2017	418	120	474
Ammerman, William M., assignor to Edwin J. Toof Company, New Haven, Conn. Interchangeable lock and chain stitch sewing-machine	809,660	Jan. 9	2132	442	120	499
Ammerman, William M., assignor to Edwin J. Toof Company, New Haven, Conn. Feeding mechanism for sewing-machines	809,661	Jan. 9	2135	442–3	120	499
Amundson, Martin O., Ivanhoe, Minn. Lamp-burner	810,457	Jan. 23	3802	781	120	950
Andem, Clinton S., North Greevenor Dale, Conn. Cloth-tension device for take-up mechanism for looms	809,239	Jan. 2	1254	255	120	276
Andersen, Peder, assignor to O. Hanson, Seattle, Wash. Horse-blanket	808,803	Jan. 2	361	78	120	80
Anderson, Andrew, Mason, Wis. Car-lock	813,782	Feb. 27	4462	966	120	2604
Anderson, Anton, and W. E. Palmer, Graniteville, Utah. Hay-fork	811,266	Jan. 30	5399	1126	120	1332
Anderson-Barngrover Mfg. Co. (See Anderson, William C., assignor.) (Reissue.)						
Anderson, Charles H., Chicago, Ill. Conveyer	813,134	Feb. ?	3241	711–13	120	2263
Anderson, Edward H., Schenectady, N. Y., assignor to General Electric Company. Control of automobile-motors	811,533	Feb. 6	1	1	120	1485
Anderson, Edward V., Pittsburg, Pa. Stand-pipe for railways	811,812	Feb. 6	521	116–17	120	1596
Anderson, Edward V., Pittsburg, Pa. Valve	811,813	Feb. 6	523	117	120	1597
Anderson, Frederick F., New York, N. Y. Cigarette-machine	811,118	Jan. 30	5061	1062	120	1263
Anderson, Frederick F., New York, N. Y. Means for cleaning floors	811,119	Jan. 30	5063	1063	120	1264
Anderson, John, Boston, Mass. Means for muting vibrations in railway-rails	811,535	Feb. 6	4	1	120	1485
Anderson, John S., St. Louis, Mo., assignor to North & Judd Manufacturing Company, New Britain, Conn. Breast-strap slide and attachment	809,927	Jan. 16	2632	544	120	663
Anderson, Knud, Tacoma, Wash., and L. Pederson, assignors of one-third to H. Meyer, Manitowoc, Wis. Door-securer	810,692	Jan. 23	4244	879	120	1049
Anderson, Leman C., Indianapolis, Ind. Weather-board gage	810,246	Jan. 16	3309	686	120	805
Anderson, Rowland, Chihuahua, Mexico. Railway-spike	810,458	Jan. 23	3803	781	120	950
Anderson, William C., assignor, by mesne assignments, to Anderson-Barngrover Mfg. Co., San Jose, Cal. Fruit-grader. (Reissue)	12,459	Feb. 27	4963	1099	120	2707
Anderson, William M., Pittsburg, Pa. Glass-furnace	808,804	Jan. 2	362	78	120	80
Anderson, William M., Pittsburg, Pa. Lear	813,194	Feb. 20	3341	735	120	2304
Anderton, Charles, Jr. (See Leppert, William, assignor.)						
Andrews, Frederick A., assignor to W. A. S. Benson and Company, Limited, London, England. Pendent gas and other lamp	812,111	Feb. 6	1151	253	120	1723
Andrews, George C., Minneapolis, Minn. Machine for punching metal	808,712	Jan. 2	172	39	120	39
Andrews, Ignatius, New York N. Y. Folding baby-carriage and cradle	810,247	Jan. 16	3311	686–7	120	806
Andrews, Thomas M., Nashville, Tenn. Valve for engines	811,117	Jan. 30	5078	1061–2	120	1263
Andrews, W. K. (See Thomas, Bert H., assignor.)						
Andrus, Herbert B., Buffalo, Wyo. Gun-sight	811,267	Jan. 30	5401	1127	120	1333
Anger, John E. (See Stanley and Anger.)						
Angin, Wallace W., assignor of one-half to J. A. Lamun, Buffalo, Mo. Rail-joint	810,598	Jan. 23	4077	840	120	1010
Angus, Anna A., and D. B. Cameron, New York, N. Y. Manicuring appliance	811,992	Feb. 6	932	204	120	1679
Aniline Colour and Extract Works, formerly John R. Geigy. (See Hagenbach, John, assignor.)						
Anker-Holth, Severin C., Riverside, Ill. Friction-clutch	813,396	Feb. 27	3760	826	120	2449
Annis, John E. (See Lieb, Robert C., assignor.)						
Ansorge, Eugene K., Greenbay, Wis. Wrench	810,599	Jan. 23	4078	840	120	1011
Anstice, Josiah. (See Smith, Edward F., assignor.)						
Anthony, Daniel E., assignor of one-half to E. E. Mellen, Akron, Iowa. Corn-harvester	810,693	Jan. 23	4246	879–80	120	1049
Anthony, Edgar G., New York, N. Y. Picture-frame	811,355	Jan. 30	5566	1161	120	1368
Apgar, Gorman J., Robinson, Ill. Cement-block machine	810,019	Jan. 16	2930	585	120	705
Appert, Leon, Paris, France. Manufacturing window-glass	809,418	Jan. 9	1653	339–40	120	396
Apple, Vincent G., Dayton, Ohio. Gas-engine	811,757	Feb. 6	410	90	120	1576
Applegate, Clarence R., Evansville, assignor of five-eighths to S. A. Schmitt, Vanderburg county, Ind. Filter	810,020	Jan. 16	2832	586	120	706
Appleyard, Hollo, Silvertown, England. Ball	808,713	Jan. 2	174	40	120	39
Aradi, Johann, Prakfalu, Austria-Hungary. Dismountable building	809,163	Jan. 2	1063	221	120	233
Arbecam Nautical Instrument Co. (See How, Benjamin V., assignor.)						
Arbuthnot, Charles, McKees Rocks, Pa. Horseshoe-shaping machine	813,135	Feb. 20	3245	713–14	120	2284
Arcade Manufacturing Company. See Bitner, Harry, assignor.)						
Archer, William S., Providence, R. I. Machine for disintegrating, cleaning, and assorting fibrous materials	810,898	Jan. 30	4661	971	120	1171
Arduino, Amedeo A. (See Arduino, Peter W. and A. A.)						
Arduino, Peter W. and A. A., Stamford, Conn. Electric lamplighter	810,384	Jan. 23	3628	747	120	909
Arey, Fred C., Chicago Heights, Ill. Tool for bonding rails	812,803	Feb. 20	2561	564	120	2133
Arlington Company. (See Chapman and Stone, assignors.)						
Armes, Scott, Montgomery, Ind. Wire-stretcher	809,767	Jan. 9	2330	482	120	544
Armstrong, Albert H., Schenectady, N. Y., assignor to General Electric Company. Induction-motor control	811,758	Feb. 6	414	91	120	1576
Armstrong, Frederick M. (See Kip and Armstrong.)						
Arnett, Edgar C., Washington, Kans. Automatic weighing-machine	810,694	Jan. 23	4248	880–1	120	1049
Arnold, Allen A. (See Scanlon and Arnold.)						
Arnold, Ernest W., assignor of one-half to V. Salas, San Francisco, Cal. Treating ores	812,473	Feb 13	1915	422	120	1966
Arnold, George T., assignor of one-half to H. W. Lewis, Oshkosh, Wis. Rudder	812,161	Feb. 6	1287	281–2	120	1751
Arnold, Horace L., Brooklyn, N. Y., assignor to Union Typewriter Company, Jersey City, N. J. Type-writing machine	808,714	Jan. 2	176	40	120	39
Arnold, Jasil M. (See Kelly, George E., assignor.)						
Arnold Print Works. (See Jeanmaire and Schmid, assignors.)						
Aron, Hermann, Charlottenburg, Germany. Clockwork electricity-meter	813,610	Feb. 27	4186	919	120	2545
Aron, Hermann, Charlottenburg, Germany. Electricity-meter	813,685	Feb. 27	4324	951–2	120	2574
Aronstein, Sidney. (See Coleman, Clyde J., assignor.)						
Arrowsmith, William H., Oakland, Cal. Measuring-spoon	808,967	Jan. 2	699	151	120	154

Arsem, William C., Schenectady, N. Y., assignor to General Electric Company. Electro-deposition	811,750	Feb. 6	415	91	120	1577
Arsmault, Albert J., Boston, Mass. Street letter-box	811,611	Feb. 6	150	33	120	1516
Arthur, Nicol S., Glasgow, Scotland. Machine for bending metal bars, &c.	808,619	Jan. 2	3	1	120	3
Ashcraft, Alonzo, Fort Smith, Ark. Cut-off valve for gas or oil burners	812,715	Feb. 13	2391	526	120	2080
Asher, William J., Willimantic, Conn. Automatic apron or belt guide	813,996	Feb. 27	4932	1091	120	2703
Ashley, Frank M., New York, N. Y. Inkstand	811,536	Feb. 6	5	1-2	120	1486
Askenasy, Paul. (See Koller and Askenasy.)						
Ateliers de Constructions Mécaniques Cidevant Ducommun. (See Muff, Charles E., assignor.)						
Atherton, Edwin F., Macedon, N. Y. Horseshoe-calk	808,891	Jan. 2	538	120	120	119
Athey, James L., Woodbine, Iowa. Mail-crane	810,800	Jan. 23	4080	841	120	1011
Atkins, Frank S. (See Devin and Atkins.)						
Atkinson, Adrienna O., Louisville, Ky., assignor of one-half to G. Jurt, Alexandria, Ind. Sifter	813,763	Feb. 27	4464	986	120	2604
Atkinson, John M., Chicago, Ill., assignor, by mesne assignments, to Rail Joint Company. Means for electrically connecting railway-rails and the like	813,996	Feb. 27	4933	1091	120	2703
Auchly, Albert, Montgomery, Mo. Hog-trap	812,391	Feb. 13	1771	387-8	120	1927
Audrieth, Ludwig, New York, N. Y. Door-check	810,021	Jan. 16	2833	526	120	706
Augustine, Benjamin F., Buffalo, N. Y. Rotary engine	810,901	Jan. 23	4082	841-2	120	1011
Auld, Hugh R., Boston, Mass. Vehicle-tire	812,321	Feb. 13	1637	380	120	1899
Aultman, Thomas G., Fairmont, W. Va. Self-lubricating wheel	811,356	Jan. 30	5567	1162	120	1368
Aulton, Emma M., Bushbury, near Wolverhampton, England. Harness lining and pad and the like	809,276	Jan. 9	1345	273	120	331
Aupperle, Charles F. (See Corbin, Charles B., assignor.)						
Aurora Automatic Machinery Company. (See Norling, Reinhold A., assignor.)						
Aurora Automatic Machinery Company. (See Ottaway, William, assignor.)						
Austin, Edward N. (See Austin, James D. and E. N.)						
Austin, Frederick T. (See Reece and Austin.)						
Austin, Henry, Felton, Del. Apparatus for heating propagating-beds	810,835	Jan. 23	4506	938	120	1105
Austin, James D. and E. N., assignors of one-third to H. Hoover, Campbell Hill, Ill. Steam-valve	810,248	Jan. 16	3313	687	120	806
Auto-Car Equipment Company. (See Smith, Russell G., assignor.)						
Autocoil Company. (See Varley, Richard, assignor.)						
Automatic Car Fender Co. (See Fairchild, Frank J., assignor.)						
Automobile Importing Company. (See Grillier, Georges, assignor.)						
Automobile Wheel and Rim Company of New Jersey. (See Hodgson, Isaac, assignor.)						
Avery, George C., assignor to B. F. Avery & Sons, Louisville, Ky. Wheel for planters	809,888	Jan. 9	2538	526	120	591
Avery Manufacturing Company. (See Springer, William N., assignor.)						
Avery, Thaddeus, Jr., Joliet, Ill. Submarine dredge	813,935	Feb. 27	4822	1064	120	2680
Awbrey, Henry R., Forsyth, Mo. Stovepipe-thimble	811,537	Feb. 6	7	2	120	1486
Axford, Edward, Philadelphia, Pa. Wrench	813,686	Feb. 27	4327	952	120	2575
Ayers, Dee, and J. D. Sloan, Mount Vernon, Mo. Churn	809,889	Jan. 9	2540	527	120	592
Ayers, Raymond F. (See Keen and Ayers.)						
Azary, Cornelius von, Lippa, Austria-Hungary. Apparatus for making open-work wire receptacles	811,357	Jan. 30	5569	1162	120	1368
Azuma, Takesari, Kanda, Tokyo, Japan. Flash-light device	813,849	Feb. 27	4654	1029	120	2645
B. F. Avery & Sons. (See Avery, George C., assignor.)						
Baar, Charles, Grand Rapids, Mich. Boring-tool	810,602	Jan. 23	4098	842	120	1012
Babio, José G., Brooklyn, N. Y. Spring-wheel for vehicles	813,397	Feb. 27	3761	826	120	2449
Babio, Manuel G., New York, N. Y. Vehicle-wheel	809,040	Jan. 2	816	176	120	180
Babio, Manuel G., New York, N. Y. Vehicle-wheel	812,629	Feb. 13	2237	487	120	2020
Babu, Lala R., Patiala, Patiala State, India. Chess-recorder	810,899	Jan. 30	4664	971-3	120	1172
Bach, Julius H., Chicago, Ill. Brick-clay-crusher rolls	813,273	Feb. 20	3490	709	120	2334
Bacher, Peter. (See Rowland and Bacher.)						
Backlin, Axel F., and I. Eklund, assignors to American Steel & Wire Company of New Jersey, Worcester, Mass. Spindle-brake device for wire-fence machines	808,892	Jan. 2	539	120	120	119
Backlin, Axel F., and I. Eklund, assignors to American Steel & Wire Company of New Jersey, Worcester, Mass. Tension mechanism for wire-fence machines	810,695	Jan. 23	4254	881-2	120	1051
Backlin, Axel F., and I. Eklund, assignors to American Steel & Wire Company of New Jersey, Worcester, Mass. Driving mechanism for coiler-spindles of wire-fence machines	810,696	Jan. 23	4256	882-3	120	1051
Backus, Henry N., Detroit, Mich. Slatted crate	811,023	Jan. 30	4916	1025	120	1228
Backus, John C., Smethport, Pa. Means for setting and spotting tenpins	809,890	Jan. 9	2541	527-8	120	592
Badeau, George M., *et al.* (See Duplessis, Elould, assignor.)						
Badger, Thomas N., Oakland, Cal. Beam-compass	812,322	Feb. 13	1639	360	120	1899
Badger, William F., Quincy, Mass. Pneumatic tool	810,603	Jan. 23	4087	842	120	1012
Badische Anilin & Soda Fabrik. (See Bally and Isler, assignors.)						
Badische Anilin & Soda Fabrik. (See Bally and Wolff, assignors.)						
Badische Anilin & Soda Fabrik. (See Hesseberger, Johannes, assignor.)						
Badische Anilin & Soda Fabrik. (See Strahlenert and Reubold, assignors.)						
Baehr, George, McKeesport, assignor to National Tube Company, Pittsburg, Pa. Tube-drawing apparatus	808,620	Jan. 2	6	2	120	4
Baer, Frederick A., Paterson, N. J. Beaming-machine	811,358	Jan. 30	5570	1162	120	1369
Baggaley, Ralph. (See Allen, Charles M., assignor.)						
Baggaley, Ralph, Pittsburg, Pa. Producing vitrified brick, tile, and various shapes	810,022	Jan. 16	2834	.....	120	706
Baggaley, Ralph, Pittsburg, Pa., C. M. Allen, Lolo, Mont., and E. W. Lindquist, Chicago, Ill.; said Allen and Lindquist assignors to said Baggaley. Refining copper	810,249	Jan. 16	3314	688	120	806
Baggett, Robert A., Belton, Tex., assignor to Mellor Box Opener Company, Sedalia, Mo. Combination-tool. (Reissue)	12,458	Feb. 20	3756	825	120	2390
Bagley, Forrest C. (See Hill, John L., assignor.)						
Bagley, Olin H., Deadwood, Cal. Gold-saving apparatus	812,474	Feb. 13	1916	422-3	120	1967
Bagnall, Joseph, North Attleboro, Mass. Bracelet	808,805	Jan. 2	363	78	120	81
Bahl, Joseph and J. C., Chicago, Ill. Music-leaf turner	811,903	Feb. 6	934	204-5	120	1679
Bahl, Joseph C. (See Bahl, Joseph and J. C.)						
Baier, George, assignor of one-half to G. Baier, Jr., Buffalo, N. Y. Protector for windows	810,604	Jan. 23	4093	842	120	1014
Bailey, James, *et al.* (See Richardson, Abraham, assignor.)						
Bailey, James, *et al.* (See Richardson and Jones, assignors.)						
Bailey, Ralph W., West Newbury, Mass., assignor of one-half to C. A. Stiles, Los Angeles, Cal. Order-card	813,764	Feb. 27	4465	986	120	2604
Bailey, William S., Spring Hope, N. C. Switch	813,936	Feb. 27	4824	1065	120	2681
Bailey, Wood E., Tarkio, Mo. Cultivator	811,897	Feb. 6	896	152-3	120	1632
Baile, John J., Lancaster, Pa. Fitting-stand for dressmakers, &c.	811,288	Jan. 30	5402	1127	120	1333
Baird, Edgar W., and J. F. Durkin, Philadelphia, Pa., assignors to Standard Automatic Lubricator Company, Camden, N. J. Lubricator	811,034	Jan. 30	4917	1026	120	1229
Baker, Bryden G., Minneapolis, Minn. Threshing-machine	811,035	Jan. 30	4919	1026-7	120	1229

Alphabetical list of patentees for January and February—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Baker, Charles W., Paw Paw, Mich. Load-binder	813,032	Feb. 20	3018	664	120	2232
Baker, Edmond L., Roanoke, Va. Trolley-wire clamp	809,601	Jan. 9	2019	419	120	475
Baker, Frederick H. (See Baker, Shevlin, and Baker.)						
Baker, George W., Wilmington, Del. Machine for fleshing and working out hides and skins	811,359	Jan. 30	5572	1163-4	120	1369
Baker, Harry G., Worcester, Mass., assignor to Crompton & Knowles Loom Works. Warp stop-motion for looms	813,765	Feb. 27	4466	987	120	2605
Baker, Henry M. (See Sheetz, William J., assignor.)						
Baker, James H., G. F. Shevlin, and F. H. Baker, assignors to Baker and Shevlin Company, Saratoga Springs, N. Y. Centrifugal pulp-screen	809,041	Jan. 2	821	176	120	181
Baker, Jefferson H., Collinsville, Tex. Plow	811,814	Feb. 6	524	117	120	1597
Baker and Shevlin Company. (See Baker, Shevlin, and Baker, assignors.)						
Balch, Samuel W., Montclair, N. J. Troposcope	813,136	Feb. 20	3247	714	120	2284
Baldauf, George L. (See Neumaier, John, assignor.)						
Baldwin, Clarence K., and T. Robins, Jr., New York, N. Y., assignors to Robins Conveying Belt Co. Conveyer	810,605	Jan. 23	4094	843-4	120	1015
Baldwin Company. (See Jobes, Lawrence U., assignor.)						
Baldwin, Homer, Youngstown, Ohio. Separating-machine	812,972	Feb. 20	2906	641	120	2209
Baldwin, Stephen G., Marion, Ind. Ink-well	809,891	Jan. 9	2547	528	120	594
Ball, Francis M., Falls Church, Va. Toy pistol	808,621	Jan. 2	8	2	120	4
Ball, Frank H., Plainfield, N. J. Friction-clutch	808,622	Jan. 2	9	2	120	4
Ball, Henry P., Schenectady, N. Y., assignor of one-half to S. Insull, Chicago, Ill. Music-roll and adjustable driving-support therefor	810,606	Jan. 23	4096	844	120	1015
Ball, Reuben S., *et al.* (See Mitchell, Ira G., assignor.)						
Ballard, Heaton T., Youngstown, Ohio. Governor mechanism	812,630	Feb. 13	2241	487	120	2021
Ballard, Milton H., Lynn, Mass., assignor to Tripp Fruit Wrapping Machine Company. Wrapping-machine	812,912	Feb. 20	2774	610	120	2180
Ballentine, Fred, Moscow, Okla. Ter. Animal-trap	810,518	Jan. 23	3925	807	120	979
Ballod, Karl, Riga, Russia. Cycle-lock	813,937	Feb. 27	4826	1065	120	2681
Bally, Oscar, and M. H. Isler, Mannheim, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen-on-the-Rhine, Germany. Violet dye and making same	809,892	Jan. 9	2548	.....	120	594
Bally, Oscar, Mannheim, and H. Wolff, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen-on-the-Rhine, Germany. Anthracene compound and making same	809,893	Jan. 9	2550	.....	120	594
Bally, Oscar, Mannheim, and H. Wolff, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen-on-the-Rhine, Germany. Anthracene compound and making same	809,894	Jan. 9	2552	.....	120	594
Bally, Oscar, Mannheim, and H. Wolff, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen-on-the-Rhine, Germany. Anthracene dye and making same	811,471	Jan. 30	5764	.....	120	1409
Balsam, Louis, New York, N. Y. Cap	810,697	Jan. 23	4257	883	120	1052
Baltzer, John L., and L. S. Starrett, assignors to L. S. Starrett Co., Athol, Mass. Base attachment for center-gages	813,997	Feb. 27	4935	1091	120	2703
Bancroft, James E., assignor of one-half to C. M. Milroy, Toledo, Ohio. Tire-heater	811,026	Jan. 30	4924	1027	120	1230
Bane, James O., Waseca, Minn. Pump spring attachment	812,716	Feb. 13	2394	526	120	2050
Banker, Clarence M. (See Creighton and Banker.)						
Banks, Alexander F. (See Campbell, Robert B., assignor.)						
Banks, Archie W., assignor of one-fifth to M. A. Banks, Rockford, Ill. Heater	810,607	Jan. 23	4101	844-5	120	1016
Banks, Martin A. (See Banks, Archie W., assignor.)						
Barakat, Elias E., Washington, D. C. Portable scale	809,602	Jan. 9	2021	419	120	475
Barber Asphalt Paving Company. (See Wardell, Henry R., assignor.)						
Barber, Charles E., Syracuse, N. Y. Boat-propeller	812,475	Feb. 13	1919	423	120	1967
Barber, Charles E., Syracuse, N. Y. Boat-propeller	813,074	Feb. 20	3107	681	120	2254
Barber, Homer F., Salem, Ohio. Railway-rail joint	812,717	Feb. 13	2396	526	120	2051
Barber, John C., Chicago, Ill. Truck-bolster	809,768	Jan. 9	2331	482-3	120	545
Barbier, Benard & Turenne. (See Turenne, Emile L. P., assignor.)						
Barbour, William, Oxford, Iowa. Stock-watering tank	809,928	Jan. 16	2533	544	120	663
Barclay, James A., Indianapolis, Ind. Scale pivot-bearing	811,194	Jan. 30	5260	1101	120	1302
Barclay, John C., assignor to Western Union Telegraph Company, New York, N. Y. Telegraph-transmitter	811,994	Feb. 6	938	205-7	120	1680
Barclay, John C., assignor to Western Union Telegraph Company, New York, N. Y. Printing mechanism	811,995	Feb. 6	946	207	120	1681
Barclay, John C., assignor to Western Union Telegraph Company, New York, N. Y. Relay	811,996	Feb. 6	950	208	120	1682
Bardsley, William, Kearney, N. J. Cushioning apparatus for elevator-shaft gates	812,392	Feb. 13	1774	389	120	1927
Barisela, Tomás, J. P. Mislowsky, A. Caricchia, and L. E. Odio, Buenos Ayres, Argentina. Ether mixture for disinfecting	812,631	Feb. 13	2243	.....	120	2021
Barker, Elihu F. (See De Moss, Charles E., assignor.)						
Barker, England J., Morgan Park, Ill. Web-perfecting printing-press	810,608	Jan. 23	4102	845-7	120	1017
Barker, England J., Morgan Park, Ill. Type-writing machine	812,177	Feb. 13	1344	292-3	120	1831
Barker, England J., Morgan Park, Ill. Tension-regulating device for autographic registers	813,481	Feb. 27	3927	861-2	120	2488
Barker, Frank M., assignor to H. B. Rouse, Chicago, Ill. Printer's composing-stick	808,715	Jan. 2	184	40	120	42
Barker, John H., assignor to C. A. Parsons, Newcastle-upon-Tyne, England. Turbine	809,277	Jan. 9	1347	274	120	331
Barker, Walter H., Harrow, England. Child's folding carriage	812,323	Feb. 13	1641	361	120	1899
Barkhouse, N. N., *et al.* (See Howard, James, assignor.)						
Barlow, George D., assignor to American Brake Company, St. Louis, Mo. Turning-tool	811,027	Jan. 30	4925	1027	120	1230
Barlow, Henry C., Goldendale, Wash. Pipe-wrench	810,365	Jan. 16	3566	733	120	863
Barlow, John B., Grand Rapids, Mich. Temporary binder	811,360	Jan. 30	5574	1164	120	1370
Barnes, Dora E., W. O. Blackmun, and A. Miller, Hays, Kans. Wagon-dumping apparatus	813,687	Feb. 27	4329	952	120	2575
Barnes and Erb Company. (See Binder, Gottlob, assignor.)						
Barnes, Joshua, New York, N. Y. Inhaler	809,662	Jan. 9	2137	443	120	500
Barnes, Joshua B., Springfield, Ill. Lubricator for piston-rods	813,398	Feb. 27	3763	826	120	2450
Barnes, William M., Philadelphia, Pa. Collar and cuff shaper	811,120	Jan. 30	5086	1063	120	1264
Barnett, Morrieson J., San Francisco, Cal., assignor, by mesne assignments, to Whitson Autopress Company. Bed-and-cylinder motion for printing-presses	808,806	Jan. 2	364	79	120	81
Barnsdall, Theodore N., 2nd. (See McCourt and Barnsdall.)						
Barothy, Arpad M. (See Kovacs, Alexander, assignor.)						
Barr, Andrew J., assignor of one-half to H. E. Homberger, Mansfield, Ohio. Flush	809,603	Jan. 9	2022	419	120	475
Barr, Harry L., and F. Gaudert, Mansfield, Ohio. Brick-cutting machine	812,973	Feb. 20	2909	641	120	2209
Barret, Walter M., *et al.* (See Wyatt, George R., assignor.)						
Barrett, John F., and N. C. Collins, Chicago, Ill. Electric-light fixture	810,836	Jan. 23	4508	939	120	1106
Barry, Charles E., Schenectady, N. Y., assignor to General Electric Company. Brake system	808,716	Jan. 2	186	41	120	42
Barry, Henry, Chicago, Ill. Foldable railway-velocipede	811,289	Jan. 30	5403	1127-8	120	1333
Barry, James, assignor of three-eighths to L. D. Bodum, Seattle, Wash., and E. J. Brennan, St. Paul, Minn. Railway-tie	810,698	Jan. 23	4259	883	120	1052

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drf's.	Official Gazette. Vol.	Official Gazette. Page.
Barry, Jefferson D., assignor of three-fourths to D. Wise, F. D. Dehn, and M. L. Crossland, Waco, Tex. Combination-tool	813,342	Feb. 20	3630	798	120	2364
Barry, Thomas D., Brockton, Mass. Stitch-separator and pricking-up machine	811,997	Feb. 6	952	208	120	1682
Bartalt, Friedrich L., Bristol, England. Apparatus for preparing bleaching liquor	813,686	Feb. 27	4330	953	120	2576
Barth, Albert, assignor to S. A. John, Pawpaw, Ill., and J. L. Krats, Columbus, Ohio. Sheep-shearing table	810,181	Jan. 16	3165	655	120	775
Barth, Otto B., Loveland, Colo. Sugar-machine	810,260	Jan. 16	3320	689	120	807
Bartlett, Albert D., Hampton, Va. Shutter-fastener	813,343	Feb. 20	3640	798	120	2365
Bartlett, Eayre O., and W. F. Gordon, Joplin, Mo. Densifying and eliminating air and gas from masses of pulverulent metallic salts and oxids	809,354	Jan. 9	1499	303	120	365
Bartlett, Henry F., Hamilton, Canada. Flexible toy-hanger	810,900	Jan. 30	4670	973	120	1173
Bartlett, John E. (See Voss, Detlef C., assignor.)						
Bartlett, Marcus J., Chicago, Ill. Cattle-tag	810,385	Jan. 23	3630	748	120	909
Bartoletti, Peter, Brownsville, Pa. Rotary explosion-engine	810,366	Jan. 16	3567	733-4	120	893
Barton, John A., Virginia, Minn. Wrench	813,850	Feb. 27	4655	1029	120	2646
Bascom, Almon W., Spokane, Wash. Metallic railway-tie	813,611	Feb. 27	4190	919	120	2546
Base, Robert S., *et al.* (See Melton, Henry C., assignor.)						
Bastian, Charles L., Chicago, Ill. Guiding means for bowling-alley pin spotters or setters	811,612	Feb. 6	152	33	120	1518
Bastian, Charles L., Chicago, Ill. Bowling-alley pin-spotter	812,253	Feb. 13	1495	327	120	1865
Bastian, Charles O., assignor to Bastian Meter Company Limited, London, England. Electrolytic electricity-meter	811,538	Feb. 6	8	2-3	120	1486
Bastian Meter Company. (See Bastian, Charles O., assignor.)						
Batcheider, Asa F., Schenectady, N. Y., assignor to General Electric Company. Electric locomotive	808,717	Jan. 2	188	41	120	43
Batcheller, Birney C., Philadelphia, Pa., assignor to Pearsall Pneumatic Tube and Power Company, New York, N. Y. Carrier for pneumatic tubes	808,623	Jan. 2	11	3	120	5
Bates, Adelmer M., assignor to Bates Valve Bag Company, Cleveland, Ohio. Valve-bag	810,318	Jan. 16	3467	717	120	840
Bates & Bacon. (See Wallenthin, Walfrid, assignor.)						
Bates, Ralph E., Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company. Electrical control system	811,539	Feb. 6	10	3	120	1487
Bates, Theodore C., Worcester, Mass. Apparatus for sterilizing and cleansing bottles	812,974	Feb. 20	2910	642	120	2210
Bates Valve Bag Company. (See Bates, Adelmer M., assignor.)						
Bates Valve Bag Company. (See Rogers, John, assignor.)						
Bates, William H., R. C. Douglass, and W. G. Nourse, assignors to Marine Iron Works, Chicago, Ill. Rotary engine	811,613	Feb. 6	153	33-4	120	1518
Bauchelle, John U., *et al.* (See Rich, Charles C., assignor.)						
Bauchelle, Wm. M., *et al.* (See Rich, Charles C., assignor.)						
Baudin, Adrien, Paris, France. Generator of fluid-pressure	813,075	Feb. 20	3109	681	120	2254
Bauer & Black. (See Bauer, Parry S., assignor.)						
Bauer & Black. (See Schuls, Otto C., assignor.)						
Bauer, Carl E., Hammond, Ind., assignor to Simplex Railway Appliance Company, Chicago, Ill. Reinforced brake-beam	813,612	Feb. 27	4191	919	120	2546
Bauer, Charles, New York, N. Y. Car-fender	812,838	Feb. 27	4527	1005	120	2682
Bauer, Parry S., assignor to Bauer & Black, Chicago, Ill. Sanitary napkin	808,494	Jan. 2	12	3	120	6
Baugh, Thomas J., Hopkinsville, Ky. Wire-working tool	810,837	Jan. 23	4509	999	120	1106
Baugher, David L., assignor of one-half to J. P. Thayer, Paola, Kans. Well-drilling machine	812,393	Feb. 13	1777	389	120	1928
Baumann, Ernst K. A. (See Seyboth and Baumann.)						
Baumgart, August, Lind, Wash. Life-saving boat	811,815	Feb. 6	525	118	120	1397
Baurmann, Gustav, assignor to Illinois Sewing Machine Company, Chicago, Ill., White Sewing Machine Company, Cleveland, and Davis Sewing Machine Company, Dayton, Ohio. Sewing-machine cabinet	809,240	Jan. 2	1255	256	120	277
Bauroth, Leonhard, assignor to Lawrence Manufacturing Co., Toledo, Ohio. Collapsible die for wiring or beading	810,022	Jan. 16	2636	586	120	706
Bausch, Lomb, Saegmuller Co. (See Saegmuller, George N., assignor.)						
Baxendell, Franklin A., *et al.* (See Stein, Jacob, assignor.)						
Bayne, John J., Alexandria, Va. Gun-bearing	811,540	Feb. 6	12	3-4	120	1487
Beach, Edward W. (See Stiskin, Fredrick W., assignor.)						
Beach, Edwin R., Jersey City, N. J. Adding-machine	808,898	Jan. 2	542	120	120	120
Beach, Harry W., Montrose, Pa. Valve	811,361	Jan. 30	5576	1164	120	1370
Beach, Thaddeus C., St. Johns, Mich. Pedestal-table	812,394	Feb. 13	1780	390	120	1928
Beale, Harry A., McCook, Nebr. Torpedo-setting device	811,472	Jan. 30	5765	1207	120	1409
Beals, Eri V., Boston, Mass. Attachment for keyboard-machines	812,542	Feb. 13	2089	452-5	120	1987
Bean, Roscoe, Berea, Ohio. Repeating torpedo-cane	810,386	Jan. 23	3631	748	120	910
Beanes, Warwick H., and H. Walton, Peterborough, England. Hot-water heating apparatus	809,164	Jan. 2	1055	221-2	120	223
Beans, Manasseh W., Memphis, Mo. Railway-signal	810,357	Jan. 23	3635	749	120	910
Beard, Richard M., New York, N. Y. Intercommunication telephone system	809,939	Jan. 16	3634	545	120	663
Beatrice Manufacturing Company. (See Walter, Theophil P., assignor.)						
Beau, Henri, Paris, France. Pump	810,182	Jan. 16	3165	655	120	775
Beaufore, William C. (See Brabant and Beaufore.)						
Beaumont, Thomas R., Park Place, London, England. Construction of wheels	808,625	Jan. 2	13	3	120	5
Beaver, John E., Warwick, Ohio. Boltless joint connection	811,473	Jan. 30	5766	1207	120	1409
Beasley, Joseph O., Baltimore, Md. Faucet	809,595	Jan. 9	2553	528	120	594
Beckman, Henry F., assignor to Duplex Printing Press Company, Battlecreek, Mich. Flat-bed web-printing press	809,241	Jan. 2	1257	256	120	277
Beckman, Henry F., assignor to Duplex Printing Press Company, Battlecreek, Mich. Web-manipulating mechanism	811,121	Jan 30	5087	1064	120	1264
Beckman, Henry F., assignor to Duplex Printing Press Company, Battlecreek, Mich. Web-looping mechanism	811,270	Jan. 30	5408	1128	120	1334
Beckman, Henry F., assignor to Duplex Printing Press Company, Battlecreek, Mich. Web-looping mechanism	811,271	Jan. 30	5410	1128	120	1335
Beck, George C., Beavercreek, Minn. Register for pool-tables	811,195	Jan. 30	5262	1101-2	120	1302
Beck, John, Ashland, Wis. Refrigerating means	813,196	Feb. 20	3343	735-6	120	2204
Beck, William, St. Paul, assignor of six-tenths to F. and W. Brabs, J. McGrann, C. Joyce, F. Johnson, and T. Welsh, Henderson, Minn. Shoe-sole fastener	808,897	Jan. 2	388	79	120	81
Becker, Charles J., Los Angeles, Cal. Brooder	808,898	Jan. 2	387	79	120	81
Becker, John, Wichita, Kans. Door-holder	812,476	Feb. 13	1921	423	120	1988
Becker & Kahlsinger. (See Mihaster, Karl, assignor.)						
Becker, Theodor. (See Richmagrin and Becker.)						
Beckh, Walter. (See Conrad and Beckh.)						
Bedell, Richard M., Brooklyn, N. Y., assignor to Mergenthaler Linotype Company. Linotype-machine	811,362	Jan. 30	5578	1164	120	1371
Bee-Hive Fly Catcher Company. (See Samuels, Jacob, assignor.)						
Beeney, Henry S., Elmo, Ill. Brake mechanism	809,165	Jan. 2	1071	222	120	235

Alphabetical list of patentees for January and February—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drf's.	Official Gazette. Vol.	Official Gazette. Page.
Beerkle, Frank X., Jr., Hiteman, Iowa. Rake attachment	811,760	Feb. 6	416	91	120	1577
Beidler, George C., Oklahoma, Okla. Ter. Machine for exposing and developing photographic films	810,388	Jan. 23	3637	749-50	120	911
Beitner, Fred W., Traverse City, Mich. Log-turner	811,028	Jan. 30	4928	1028	120	1231
Belcher, Gilbert L., San Francisco, Cal. Dispensing device	809,419	Jan. 9	1656	340	120	396
Belcher, Gilbert L., Oakland, Cal. Fountain-brush	811,272	Jan. 30	5411	1128	120	1335
Belisl, Albert J., Mulhall, Okla. Ter. Wagon-spindle	809,166	Jan. 2	1072	223	120	235
Bell, Emma, assignor of one-half to J. Walter, Jacksonville, Fla. Heater attachment to stoves	813,137	Feb. 20	3249	714	120	2284
Bell, Jesse T., Washington, N. J. Horseshoe	808,626	Jan. 2	14	3	120	6
Bell, John A., Lathrop, Cal. Punching-machine	813,939	Feb. 27	4829	1066	120	2682
Bell, Walter J., assignor of one-half to L. F. Moss, Los Angeles, Cal. Electrofluid pressure mechanism for operating railway appliances	810,609	Jan. 23	4110	848	120	1018
Bellamy, Alfred R., Edgeley, Stockport, England. Sparking igniter for internal-combustion engines	811,122	Jan. 30	5089	1064	120	1265
Bellamy, Elmer E. (See Van Tassel-Beck, Margaret, assignor.)						
Bellamy, Frederick A., London, England. Tube-clip	813,033	Feb. 20	3019	665	120	2232
Bellefontaine Foundry & Machine Company. (See Turner, George E., assignor.)						
Bellows, Benjamin F. (See Coffe, William O., assignor.)						
Belyea, Frederick S., Brookline, Mass. Portable dental furnace	812,395	Feb. 13	1782	390	120	1929
Bemis, Thomas, Indianapolis, Ind. Pneumatic tube for store service	812,162	Feb. 6	1288	282	120	1751
Bender, Edward A., Philadelphia, Pa. Liquid-soap holder	809,806	Jan. 9	2555	529	120	595
Bending, Joseph P., Otway, Ohio. Burial-vault	809,807	Jan. 9	2556	529	120	595
Benedict, Edward S., New York, N. Y. Amusement device	811,998	Feb. 6	954	208	120	1683
Beneke, John. (See Jahnke, Rudolph G., assignor.)						
Beneke, Richard, Bromberg, Germany. Drum-mill	813,076	Feb. 20	3110	681	120	2254
Benet, Peter A., Boston, Mass. Safety-razor	811,999	Feb. 6	956	209	120	1684
Benjamin, George H., New York, N. Y., assignor to Coe Brass Manufacturing Company. Cylinder for treating heated metal	811,196	Jan. 30	5266	1102	120	1303
Bennett, Alexander, Buffalo, N. Y. Non-refillable bottle	812,904	Feb. 20	2563	564	120	2133
Bennett, Arthur E., assignor to Bennett Manufacturing Company, Buffalo, N. Y. Ice-cream mold and dipper	809,663	Jan. 9	2138	443	120	500
Bennett, Charles A., Dover, N. J. Type-wheel alinement	810,024	Jan. 16	2830	587	120	707
Bennett, Frederick, and S. A. Walker, New York, N. Y. Car-seat	809,084	Jan. 2	923	193-4	120	204
Bennett, Garfield G. (See Kyle and Hicks, assignors.)						
Bennett, Grant E., Cleveland, Ohio. Harness	812,913	Feb. 20	2781	612	120	2181
Bennett Manufacturing Company. (See Bennett, Arthur E., assignor.)						
Bennett, Walter G., and J. F. Seyfang, Toledo, Ohio. Machine for molding concrete blocks	810,025	Jan. 16	2840	587	120	707
Benson, Lewis W., Wichita, Kans. Tire-tightener	812,254	Feb. 13	1497	328	120	1866
Benson, William H., San Francisco, Cal. Mold	811,474	Jan. 30	5769	1207	120	1410
Benton, Linn B., assignor to American Type Founders Company, New York, N. Y. Matrix and punch cutting machine	809,548	Jan. 9	1893	393-4	120	450
Bentote, George, Acton, England. Lamp for burning oil, &c	813,940	Feb. 27	4831	1066	120	2682
Berens, Stanislaus. (See Gatzert and Berens.)						
Berens, Stanislaus, La Grange, and A. N. Gatzert, Chicago, Ill. Automatic flash-light apparatus	813,077	Feb. 20	3111	682	120	2255
Berg, Charles. (See Ledvinka, Joseph, assignor.)						
Bergen, Harry S., Dayton, Ohio. Perforating-machine	811,816	Feb. 6	527	118	120	1598
Bergman, August. (See Casaday and Bergman.)						
Bergmann, John, Pittsburg, Pa. Utilizing worn-out railway or like spiral steel springs	809,664	Jan. 9	2139	443	120	500
Bergoff, Julius, assignor to Empire Jewelry Case Company, Buffalo, N. Y. Covered box	810,901	Jan. 30	4670	973-4	120	1173
Beringer, John M., Pomeroy, Wash. Manure-spreader	810,459	Jan. 23	3804	782	120	950
Berkey, Albert J. (See Mick, Josiah O., assignor.)						
Berman, Benjiman N., and A. Harris, Philadelphia, Pa. Bunching-machine for making cigars	813,766	Feb. 27	4469	987	120	2605
Birmingham, John C., Kansas City, Mo. Bed-lock for ink-table distribution-presses	812,914	Feb. 20	2782	612	120	2181
Bernard, Charles, Hericourt, France. Winding mechanism for cotton-laps	811,614	Feb. 6	157	34-5	120	1519
Bernard, Horace D., Beaumont, Tex. Rotary for oil-wells	812,000	Feb. 6	958	209	120	1684
Bernhardt, Ernst F., Leipnic, Germany. Potash leaching apparatus	813,078	Feb. 20	3113	682-3	120	2255
Bernheim, Samuel, New York, N. Y. Gas-burner	812,975	Feb. 20	2911	642	120	2210
Bernstein, William F., Philadelphia, Pa. End piece for metallic bedsteads	810,699	Jan. 23	4260	883	120	1052
Berquist, Axel S. F., *et al.* (See McCabe, Franklin J., assignor.)						
Berry, Austin, Ottawa, Canada. Adjustable suspender for electrical devices	808,894	Jan. 2	545	121	120	120
Berry, Austin, Ottawa, Canada. Journal-lubricator	812,915	Feb. 20	2783	612	120	2182
Berry, Benjamin F., St. Louis, Mo., assignor to United Printing Machinery Company, Boston, Mass. Two-revolution cylinder printing-press	812,632	Feb. 13	2244	487	120	2021
Berry, Elmer and H. S., Hebron, Ohio. Corn cutter and shocker	813,851	Feb. 27	4656	1030	120	2646
Berry, Homer S. (See Berry, Elmer and H. S.)						
Berry, Leroy A., Hartford, Me. Smoothing and polishing machine	809,420	Jan. 9	1658	340	120	396
Berryman, John, Clifton, Bristol, England. Holder for match-boxes	809,665	Jan. 9	2140	444	120	501
Bertschy, Adolph J. P., assignor of one-fourth to C. H. Donnelly, Woodstock, Ill. Telephonic repeating system	812,718	Feb. 13	2396	526-7	120	2051
Bessenger, Frank H. (See Moore, Alanson A., assignor.)						
Besser, Herman, Alpena, Mich. Molding-machine	810,700	Jan. 23	4261	884	120	1052
Best, Isaac, Essex, Mass. Machine for combing wool	811,817	Feb. 6	530	118	120	1598
Best, John, Jeannette, Pa. Paddle-wheel	812,805	Feb. 20	2565	564	120	2133
Bethlehem Steel Company. (See Hammar, Sigard A. S., assignor.)						
Bethlehem Steel Company. (See Maigs and Hammar, assignors.)						
Bethlehem Steel Company. (See Maigs and Jakobsson, assignors.)						
Bethlehem Steel Company. (See Maigs and Stout, assignors.)						
Bethlehem Steel Company. (See Maigs, Jakobsson, and Sullivan, assignors.)						
Bethlehem Steel Company. (See Philp, Castmir von, assignor.)						
Bethlehem Steel Company. (See Stout, Robert P., assignor.)						
Bethlehem Steel Company. (See Stout and Hughes, assignors.)						
Bettendorf Metal Wheel Company. (See Rinkelt, Emil, assignor.)						
Betsel, William F. (See McDermott and Betsel.)						
Bewyer, Frank E., Newton, Iowa. Display-rack	812,396	Feb. 13	1783	390	120	1929
Beyer, Otto S., East Rutherford, N. J., assignor to E. W. Bliss Company. Seaming-machine	813,024	Feb. 20	3020	665	120	2233
Beyerle, Gottlob W., San Diego, Cal. Wire-fence lock	809,549	Jan. 9	1902	394	120	451
Beyland, Sidney A., assignor to Dean Electric Company, Elyria, Ohio. Lamp-jack for telephone-switchboards	810,367	Jan. 16	3569	734	120	964
Bible, Hunley. (See Robinson and Bible.)						
Biddle, William B. (See Miller, John, Jr., assignor.)						
Biddle, William S. (See Pettrey and Biddle.)						
Bidwell, Richard O., South Vineland, N. J. Machine for washing sand	810,261	Jan. 16	3322	689	120	807

Billington, Robert, *et al.* (See Richardson and Jones, assignors.)						
Billman, Charles H., Boston, Mass. Rope	808,895	Jan. 2	547	121	120	120
Billman, Obed C. (See Foster, Samuel T., Jr., assignor.)						
Bills, Walter, South Melbourne, Victoria, Australia. Wire mattress	810,519	Jan. 23	3926	808	120	979
Billstein, Aaron, assignor to Friedenwald Company of Baltimore City, Baltimore, Md. Collapsible reel	811,898	Feb. 6	701	153	120	1633
Billstein, Aaron, assignor to Friedenwald Company of Baltimore City, Baltimore, Md. Collapsible reel	811,899	Feb. 6	701	153	120	1633
Bilz, William C., New York, N. Y. Fire-extinguishing device	812,001	Feb. 6	960	209	120	1684
Binder, Gottlob, assignor to Barnes and Erb Company, Philadelphia, Pa. Support for centrifugal extractors	811,363	Jan. 30	5580	1165	120	1371
Bingham, George S. (See Calder, James, assignor.)						
Birch, John H. (See Birch, John H. and J. H.)						
Birch, John H. and J. H., Crawfordsville, Ind. Box-tray-forming machine	809,930	Jan. 16	2641	545–6	120	667
Bird, Peter B., New York, N. Y. Boiler compound	810,838	Jan. 23	4510	.....	120	1106
Birmingham, John P., assignor to R. Catlett, R. A. Marr, Lexington, W. G. Mathews, Clifton Forge, J. E. Edmunds, D. P. Halsey, and J. W. Gerow, Lynchburg, Va. Automatic emergency air-brake-operating device for railways	811,687	Feb. 6	295	66	120	1550
Birt, Charles S., Birmingham, England, assignor, by mesne assignments, to E. De Trey & Sons. Inhaler	813,344	Feb. 20	3641	798	120	2365
Birtman, Charles F., Chicago, Ill. Ozone-generator	811,364	Jan. 30	5581	1165–6	120	1372
Bishop, Abiathar, Pittsburg, Pa. Pile-driver	809,242	Jan. 2	1259	256	120	278
Bishop, Emerie L., Wausaukee, Wis. Saw-dressing machine	810,610	Jan. 23	4111	848–9	120	1019
Bishop, Robert H., and W. Down, Highgate, assignors of two-thirds to L. E. Clark and S. F. Staples, London, England. Money-box	811,818	Feb. 6	533	119	120	1599
Bisler, Gustav A., Philadelphia, Pa. Candy-holder	812,002	Feb. 6	961	210	120	1685
Bitner, Harry, Berwyn, assignor to Arcade Manufacturing Company, Freeport, Ill. Mop-holder	809,243	Jan. 2	1264	257	120	279
Bittle, James F. (See Booth and Bittle.)						
Bixler, Emma E., Easton, Pa. Metal window-box for flowers	812,806	Feb. 20	2566	565	120	2133
Bjurström, Fredrik, New York, N. Y. Inking apparatus for stamp-canceling and post-marking machines	812,255	Feb. 13	1499	328	120	1866
Bjurström, Fredrik, New York, N. Y. Feed mechanism for stamp-canceling and post-marking machines	812,780	Feb. 13	2511	552	120	2076
Black, Charles H., Pettyville, Ind. Reinforced concrete construction	813,540	Feb. 27	4045	886	120	2515
Black-Ford Utility Oil Company. (See Blackmore, Henry S., assignor.)						
Black, George F., Baltimore, Md. Apparatus for cooling liquids	812,256	Feb. 13	1500	328	120	1866
Black, Gilbert L., Minoa, N. Y. Gun-sight	810,702	Jan. 23	4265	884	120	1053
Black, Gilbert L., Minoa, N. Y. Gun-sight	810,703	Jan. 23	4266	885	120	1053
Black, William, Rices Landing, Pa. Cage for mine and elevator shafts	809,809	Jan. 9	2560	529–30	120	595
Black, William C., Plymouth, Ohio. Kneading-tray	810,101	Jan. 16	3006	626	120	746
Blackburn, Frank H., Fostoria, assignor to National Electric Lamp Company, Cleveland, Ohio. Machine for making air-hole glassware	810,460	Jan. 23	3806	782	120	951
Blackburn, Frank H., Fostoria, assignor to National Electric Lamp Company, Cleveland, Ohio. Machine for glazing air-hole glassware	810,461	Jan. 23	3808	782	120	951
Blackburn, Frank H., Fostoria, assignor to National Electric Lamp Company, Cleveland, Ohio. Apparatus for making air-hole glassware	810,462	Jan. 23	3810	783	120	952
Blackburn, Frank H., Fostoria, assignor to National Electric Lamp Company, Cleveland, Ohio. Making air-hole glassware	810,463	Jan. 23	3814	783	120	953
Blackburn, Frank H., Fostoria, assignor to National Electric Lamp Company, Cleveland, Ohio. Machine for making air-hole glassware	810,464	Jan. 23	3815	784	120	953
Blackburn, Frank H., Fostoria, assignor to National Electric Lamp Company, Cleveland, Ohio. Apparatus for making air-hole glassware	810,465	Jan. 23	3816	784	120	954
Blackburn, Frank H., Fostoria, assignor to National Electric Lamp Company, Cleveland, Ohio. Making incandescent lamps	810,466	Jan. 23	3818	784	120	954
Blackburn, Jasper, Chillicothe, Mo. Anchor for guy-wires	812,003	Feb. 6	963	210	120	1685
Blackford, Joseph H. M. (See Faherty and Blackford.)						
Blackmore, Henry S., Mount Vernon, N. Y. Electrolytic apparatus	809,085	Jan. 2	925	194	120	205
Blackmore, Henry S., Mount Vernon, N. Y. Producing caustic alkali	809,086	Jan. 2	936	195	120	207
Blackmore, Henry S., Mount Vernon, N. Y. Making caustic alkali	809,089	Jan. 2	940	195	120	208
Blackmore, Henry S., Mount Vernon, N. Y. Making ketones	809,900	Jan. 9	2561	530	120	596
Blackmore, Henry S., Mount Vernon, N. Y., assignor to Black-Ford Utility Oil Company. Extracting sulfur from the sulfur-containing constituents of petroleum	809,086	Jan. 2	929	194	120	206
Blackmore, Henry S., Mount Vernon, N. Y., assignor to Black-Ford Utility Oil Company. Eliminating sulfur from the sulfur-containing constituents of petroleum	809,087	Jan. 2	93[illegible]	194	120	206
Blackmun, William O. (See Barnes, Blackmun, and Miller.)						
Blackstone, Daniel, Shelbyville, Ill. Elevator	813,941	Feb. 27	4833	1066–7	120	2663
Blackwell, Henry, *et al.* (See Hubbard, Frederick J., assignor.)						
Blair, Frank M., Toledo, Ohio. Automobile	813,541	Feb. 27	4046	886	120	2516
Blair, Welsey W. (See Greenlaw, Warren A., assignor.)						
Blake, Charles C., Brookline, Mass. Electric signal	810,027	Jan. 16	2845	588	120	708
Blake, Jacob, Bedford, Iowa. Burial-casket	813,942	Feb. 27	4835	1067	120	2663
Blake, John A., and J. Kenrich, Wolcott, Ind. Concrete-block machine	809,901	Jan. 9	2563	530–1	120	596
Blakeslee, Henry J., Hartford, Conn. Regulating-transformer	808,718	Jan. 2	194	42	120	45
Blasingame, Wesley F., Moultrie, Ga. Dental obtunder	810,611	Jan. 23	4113	849	120	1019
Blaylock, Henry H., Houstonville, N. C. Folding bedstead	809,167	Jan. 2	1073	223	120	235
Blasej, Richard, New York, N. Y. V-block	810,319	Jan. 16	3470	717	120	840
Bleesschmidt, Charles E., Bellevue, Ky., assignor to Victor Safe & Lock Co., Cincinnati, Ohio. Grinding-machine	810,903	Jan. 30	4674	974	120	1174
Bliss, Philip F., Chicago, Ill. Automatic elevator-gate	810,839	Jan. 23	4511	939	120	1106
Bliss, Charles P., assignor to A. M. McPhail Piano Company, Boston, Mass. Hammer-supporting flange for piano-actions	809,042	Jan. 2	825	177	120	182
Bliss, Anthony H., North Attleboro, Mass. Bracelet	810,183	Jan. 16	3166	656	120	776
Blodgett, William H., Los Angeles, Cal., and W. E. Miller, Boise, Idaho. Centerless engine	811,668	Feb. 6	207	66	120	1551
Bloemquist, Frank L., Sanders, Idaho. Clothes-tongs	809,244	Jan. 2	1265	257	120	279
Bloomingdale, Frank, Voorheesville, N. Y. Dumping-wagon	810,028	Jan. 16	2851	588	120	709

Bockhoff, William F., Indianapolis, Ind., assignor to National Cash Register Company, Jersey City, N. J. Cash-register	811,761	Feb. 6	417	92–3	120	1577
Boda, Lee M. (See Boda, William J., assignor.)						
Boda, William J., Dayton, assignor of one-half to L. M. Boda, Columbus, Ohio. Secret nail	808,968	Jan. 2	700	151	120	154
Bode, Peter J., St. Louis, Mo. Back-pressure trap for sewer-pipes	810,390	Jan. 23	3650	750–1	120	915
Bodum, Louis D., *et al.* (See Barry, James, assignor.)						
Boehner, Jacob P., Freeport, Ill. Binder for loose leaves of books	812,397	Feb. 13	1786	391	120	1929
Boehringer & Boehne, C. F. (See Barason, Leopold, assignor.)						
Boggs, James F., Needles, Cal. Cloth measuring and marking machine	813,767	Feb. 27	4471	987	120	2606
Bolce, Augustin. (See Schuman, James B., assignor.)						
Bois, Clara. (See Plotkin, Max, assignor.)						
Boise, Frank C. (See Warner, Isaac M., assignor.)						
Boisse, Louis M. J. de. (See Denis and Boisse.)						
Bokmayer, Walter. (See Swoboda, Adolf, assignor.)						
Bolden, James A., Gray, La. Machine for cutting sugar-cane	813,943	Feb. 27	4837	1067	120	2683
Boldenweck, Carl G. (See Neff and Boldenweck.)						
Bolin, Nils P., assignor of one-half to W. G. Smith, Brockton, Mass. Device for detachably securing rubber heels to boots and shoes	811,365	Jan. 30	5586	1166	120	1372
Boller, Peter, Chicago, Ill. Upholstery apparatus	811,366	Jan. 30	5587	1166–7	120	1373
Bollman, George W., Pittsburg, Pa., assignor to Otis Elevator Company, Jersey City, N. J. Steam hoisting apparatus	812,324	Feb. 13	1042	361–2	120	1900
Bölsterli, Walther, Winterthur, Switzerland. Producing solutions containing pure silver salt	809,278	Jan. 9	1348	.....	120	331
Bond, William H., Newcastle, Ind. Harrow	813,852	Feb. 27	4659	1030	120	2647
Bonn, Clyde G., Pine Bluff, Ark. Sawmill-carriage	810,320	Jan. 16	3471	717	120	841
Bonnechoes, Gaston C. E. de, Paris, France. Turbine-engine	810,252	Jan. 16	3324	690	120	808
Bonvillain, Philibert, Paris, France. Apparatus for grinding or crushing foundry-sand, &c.	810,904	Jan. 30	4675	974–5	120	1174
Bonvillain, Philibert, Paris, France. Molding-machine	812,004	Feb. 6	965	210	120	1685
Bonvillain, Philibert, Paris, France. Mold-charging apparatus	813,614	Feb. 27	4193	920	120	2546
Boof, Michel, Strassburg, Germany. Roasting apparatus for coffee, malt, &c.	813,274	Feb. 20	3491	769	120	2334
Boon, Arthur W., Brixton, England. Expansible sprocket	809,421	Jan. 9	1659	341	120	396
Boone, George M., Baltimore, Md. Smoke-consumer	809,168	Jan. 2	1074	223	120	236
Boone, John R., Nashville, Tenn. Hydrocarbon-burner	810,253	Jan. 16	3326	690–1	120	808
Booth, Alba C., Burlington, Vt. Bottle-cap lifter	812,257	Feb. 13	1501	329	120	1866
Booth, Kraft, assignor to Gillinder & Sons, Inc., Philadelphia, Pa. Knob	808,627	Jan. 2	15	4	120	6
Booth, Robert E., and J. Wise, Charleroi, Pa. Car-starter	811,123	Jan. 30	5060	1065	120	1265
Booth, Zachary T., and J. F. Bittle, assignors of one-third to C. Smith, Brunswick, Md. Railway-tie	812,807	Feb. 20	2568	565	120	2134
Borated Specialty Company. (See Dix, Edward S., assignor.)						
Borchers, William F. (See Yoders, Irvin G., assignor.)						
Borden, Bradford, assignor, by mesne assignments, to Borden Company, Warren, Ohio. Adjustable die-stock	812,308	Feb. 13	1787	391	120	1930
Borden Company. (See Borden, Bradford, assignor.)						
Born, Frank A., Grover, S. D. Spring-wheel	813,035	Feb. 20	3023	665–6	120	2233
Borneman, Andrew G., Athenia, N. J. Clothes-pin	810,704	Jan. 23	4267	885	120	1054
Borneman, Henry, Paterson, N. J. Climbing apparatus	810,254	Jan. 16	3328	691	120	809
Bornot, André F., Philadelphia, Pa. Machine for scouring garments, fabrics, &c.	812,005	Feb. 6	966	210	120	1686
Borst, Frank A., assignor to Ideal Concrete Machinery Company, South Bend, Ind. Adjustable face-plate	812,916	Feb. 20	2784	613	120	2182
Boston Pneumatic Power Company. (See Nolan and Sanborn, assignors.)						
Bottomley, James F., Wallsend, R. S. Hutton, Manchester, and A. Paget, North Cray, England. Manufacture of silica glass	812,309	Feb. 13	1790	391–2	120	1931
Boughton, Seymour W., Cleveland, Ohio. Expansion-controlled apparatus	810,255	Jan. 16	3329	691	120	809
Bouhall, Herman J., assignor of one-half to A. B. Honecker, Cleveland, Ohio. Individual safety garment-rack	812,917	Feb. 20	2785	613	120	2182
Bovee, David W., Waterloo, Iowa. Apparatus for the construction of plastic walls	812,006	Feb. 6	968	211	120	1686
Bowden, Charles H. J. (See Boulleau, Joseph A. A., assignor.)						
Bowdr, Abram L., Boyertown, Pa. Block-signal system for electric railways	810,705	Jan. 23	4268	885	120	1054
Bower, Clarence E., Denver, Colo. Baling-press	810,029	Jan. 16	2853	589	120	710
Bower, Henry F. (See Slade and Bower.)						
Bowerman, William J., Detroit, Mich. Shooting-gallery. (Reissue)	12,440	Jan. 30	5881	1233	120	1433
Bowers, Harvey, Wichita, Kans. Window-sash adjuster	812,808	Feb. 20	2569	565	120	2124
Bowers, William F. San Francisco, Cal. Dredger-sleeve	809,903	Jan. 9	2569	532	120	597
Bowes, Charles F. (See Allen and Bowes.)						
Bowler, Noadiah P. (See Roberts, Albert E., assignor.)						
Bowling, George S., Clarksville, Tenn. Ice-can filler	808,809	Jan. 2	399	80	120	82
Bowman, Benton S., Millersburg, Pa. Safety-brake for elevators	810,256	Jan. 16	3331	691	120	809
Bowman, D O, Rockford, Mich. Potato-digger	812,007	Feb. 6	971	211–12	120	1687
Bowmaster, Charles F., Litchfield, Ill. Lantern-globe rack	809,422	Jan. 9	1660	341	120	397
Bowsher, Samuel. (See Petery, Evan E. P., assignor.)						
Bowsher, Samuel. (See Petery and Jackson, assignors.)						
Boyce, Michael L., Carroll, Iowa. Fence-post	808,969	Jan. 2	701	152	120	154
Boyd, Chase, *et al.* (See Boyd, William M., assignor.)						
Boyd, Ernest I., *et al.* (See Boyd, William M., assignor.)						
Boyd, Frederic R. C. (See Callan and Boyd.)						
Boyd, John, Bessemer, Ala. Molding-bit	811,124	Jan. 30	5091	1065	120	1265
Boyd, John M., Fond du Lac, Wis. Suspended track for elevators and carriers	812,477	Feb. 13	1922	424	120	1958
Boyd, Walter C., Williamsburg, Iowa. Gate	813,615	Feb. 27	4194	920	120	2547
Boyd, William M., assignor of two-thirds to C. and E. I. Boyd, Connersville, Ind. Means for lubricating vehicle-wheels	811,615	Feb. 6	158	35	120	1520
Boyer, Charles A., and D. C. Peck, Marengo, Ill. Stovepipe	810,706	Jan. 23	4271	885	120	1055
Boyer, Oliver, Conant, Ohio. Corn-shocker	812,809	Feb. 20	2570	565–7	120	2134
Boyle, Francis D., Toledo, Ohio. Pad for upholstered furniture	813,616	Feb. 27	4196	921	120	2547
Brabant, Charles C., and W. C. Beaufore, Alpena, Mich. Wheel-hub	809,686	Jan. 9	2142	444	120	801
Bracken, William C., Gallitzin, Pa. Boiler-tube	813,788	Feb. 27	4472	988	120	2606
Bradford, Fred W. R., Melrose, Mass. Bottle-wrapper	811,669	Feb. 6	209	67	120	1583

Brand, Fritz, Berlin, Germany. Emergency electric-lighting arrangement for theaters and similar buildings	809,904	Jan. 9	2570	532	120	597
Brandt, Anthony. (See Weber, Arnold W., assignor.)						
Brandt Cashier Company. (See Brandt, Edward J., assignor.)						
Brandt, Edward J., Watertown, Wis., assignor to Brandt Cashier Company, Chicago, Ill. Coin-tray	811,197	Jan. 30	5267	1102	120	1303
Bransgrove, Charles, Monroe, Mich. Cord tension-alarm	811,367	Jan. 30	5588	1167	120	1373
Branson, Tilghman E., assignor of two-thirds to H. Hatfield and W. S. Foster, Bellepiaine, Kans. Pneumatic lifting means for grain-doors	811,660	Feb. 6	301	67	120	1552
Braun, Anton N., Arad, Austria-Hungary. Production of stove-polish	809,279	Jan. 9	1349	.....	120	331
Braxton, Daniel, assignor of one-third to C. J. Dobler, Baltimore, Md. Wrench	812,008	Feb. 6	971	212	120	1687
Bray, Charles W., assignor to American Sheet & Tin Plate Company, Pittsburg, Pa. Roll-removing device	808,719	Jan. 2	196	42	120	45
Brayshaw, Shipley N., Hulme, Manchester, England, assignor to G. Nash, New York, N. Y. Melt or bath for hardening steel	812,178	Feb. 13	1348	.....	120	1832
Braseal, Joseph E., Birmingham, Ala. Chute for unloading railway-cars	812,009	Feb. 6	972	212	120	1687
Brazier, James D., and D. O. Sullivan, Vicksburg, assignors, by mesne assignments, of one-half to B. Siani, Rolling Fork, Miss. Grabot-machine	810,707	Jan. 23	4272	896	120	1055
Breen, Cornelius M., New York, N. Y. Guard for vent-pipes	809,667	Jan. 9	2144	444	120	501
Bremer, René M. V., Schaerbeeck-Brussels, Belgium. Indicating-target	812,400	Feb. 13	1794	392	120	1931
Brennan, Dennis J., Shenandoah, Pa. Jointed rule	812,010	Feb. 6	974	213	120	1687
Brennan, Edward J., *et al.* (See Barry, James, assignor.)						
Brennan, John P., Lawrence, Mass. Expansible pulley	809,169	Jan. 2	1075	224	120	236
Brennan, Thomas L., Deward, Mich. Railway-frog	809,457	Jan. 9	1787	360	120	426
Brenton, Wiley Carlisle, Ind. Threshing-machine	812,719	Feb. 13	2405	527	120	2053
Brenzinger, Julius, assignor to Max Ams Machine Co., New York, N. Y. Can-heading machine	813,482	Feb. 27	3930	862	120	2488
Bresnahan, Maurice V. (See Heys, John J., assignor.)						
Brett, Edward S., Coventry, England. Drop-hammer	811,368	Jan. 30	5590	1167–8	120	1373
Bretschneider, Israel E., and E. K. Thumler, New York, N. Y. Regulating-hinge for piano swinging frames	809,043	Jan. 2	827	177	120	182
Brewster, Frederick H., Auburn, N. Y. Machine for blacking shoes	811,030	Jan. 30	4928	1038	120	1231
Brewster, Morris B., Columbus, Ohio. Elevator and conveyer	812,478	Feb. 13	1927	424	120	1959
Brewton, Joseph L., Mill, La. Vehicle-brake	810,612	Jan. 23	4114	849	120	1019
Bridge, James H., New York, N. Y., and C. Ellis, assignors, by mesne assignments, of one-third to Sawyer, Foster and Hardy, Boston, Mass. Making hydrated oxid of lead	811,552	Feb. 6	28	.....	120	1491
Bridgeport Hardware Manufacturing Company. (See Hobbs, Willis F., assignor.)						
Bried, Julien A., San Francisco, Cal. Panoramic camera	812,163	Feb. 6	1289	282	120	1751
Brierley, Thomas, *et al.* (See Richardson and Jones, assignors.)						
Briery, Thomas, *et al.* (See Richardson, Abraham, assignor.)						
Briggs, Arthur J., assignor to Smith Premier Typewriter Company, Syracuse, N. Y. Type-writing machine	813,345	Feb 20	3643	799	120	2366
Briggs, James E., Waterloo, Iowa. Dumping-wagon	812,918	Feb. 20	2787	613	120	2182
Bright, Henry C. (See Watson, Henry W., assignor.)						
Brill, George M., assignor to J. A. Brill, Philadelphia, Pa. Adjustable brake-hanger	813,346	Feb. 20	3647	799	120	2367
Brill, John A. (See Brill, George M., assignor.)						
Brill, John A. (See Carwen, Samuel M., assignor.)						
Brill, John A. (See Pickles, Charles K., assignor.)						
Brinker, Charles B., assignor to Brinker Safety Switch Attachment Company, West Lebanon, Ind. Railway-switch	810,906	Jan. 30	4678	975	120	1174
Brinker Safety Switch Attachment Company. (See Brinker, Charles B., assignor.)						
Brinkman, Louis H., assignor to Whitlock Coil Pipe Company, West Hartford, Conn. Automatic bending-machine	812,258	Feb. 13	1501	329	120	1957
Brinkmeyer, Fredrick W., Decatur, Ill. Ball-return mechanism for bowling-alleys	808,245	Jan. 2	1286	257	120	279
Brinkmeyer, Fredrick W., Decatur, Ill. Bowling-alley	811,476	Jan. 30	5771	1208	120	1410
Brinley, Charles A., assignor to American Pulley Company, Philadelphia, Pa. Wheel	812,179	Feb. 13	1349	293	120	1833
Brinton, Walter, High Bridge, N. J., assignor to Taylor Iron and Steel Company. Cast manganese-steel rail	812,810	Feb. 20	2578	567	120	2136
Brinton, Walter, High Bridge, N. J., assignor to Taylor Iron and Steel Company. Treating manganese steel	812,811	Feb. 20	2580	.....	120	2137
Brinton, Walter, High Bridge, N. J., assignor to Taylor Iron and Steel Company. Making safes or vaults	813,304	Feb. 20	3734	821	120	2385
Briquetting Company. (See Cole, Henry W. N., assignor.)						
Briscoe, Benjamin, assignor to Briscoe Manufacturing Company, Detroit, Mich. Cooler	810,030	Jan. 16	2855	589	120	719
Briscoe Manufacturing Company. (See Briscoe, Benjamin, assignor.)						
Brister, Samuel H., Monticello, Iowa. Brush	810,708	Jan. 23	4274	896	120	1056
Bristol, William H., New York, N. Y. Thermo-electric couple	811,819	Feb. 6	535	119	120	1389
Bristol, William H., New York, N. Y. Indicating and recording device	813,689	Feb. 27	4322	963	120	2576
Britt, Orlin P. (See Kramer and Britt.)						
Britton, James A., Bethlehem, Pa. Hose puller and wringer	810,269	Jan. 16	3335	692–3	120	810
Broad, William, Aliquippa, Pa. Wire-stretching device	812,401	Feb. 13	1796	393	120	1931
Broadbent, William, Salt Lake City, Utah. Carved gum-form	810,184	Jan. 16	3167	688	120	776
Broadbent, John W., and F. W. Ordish, assignors to Robert Dempster & Sons, Ltd., Elland, England. Apparatus for discharging gas-retorts	813,479	Feb. 13	1939	425–6	120	1999
Broadwell, Walter L., South Norfolk, Va. Collapsible table	809,170	Jan. 2	1077	224–5	120	236

Brockway, Watson O., Threecoaks, Mich. Overshoe-fastener	809,905	Jan. 9	2571	532	120	598
Brode, Charles W., New Comerstown, Ohio. Clothes-frame	812,011	Feb. 6	975	213	120	1686
Brodeur, Francois X., assignor of one-half to E. W. Mullins, Lynn, Mass. Shoe	812,812	Feb. 20	2583	567	120	2137
Brodnax, Clarence M., and P. F. King, New York, N. Y. Bottle-closure	808,639	Jan. 2	18	4	120	6
Bromley, George W., Lake View, N. J. Winding-machine	812,012	Feb. 6	977	213	120	1688
Bronder, Gaston A., Brooklyn, N. Y. Lubricating device for wheels and axles	812,402	Feb. 13	1798	393	120	1931
Bronson, Enos A. (See Wilson and Bronson.)						
Brooke, Isaac, Pottstown, assignor to Floyd-Wells Company, Royersford, Pa. Radiator	813,275	Feb. 20	3492	770	120	2335
Brookfield, Henry M., New York, N. Y. Glass-furnace	808,810	Jan. 2	371	80	120	82
Brookfield, Henry M., New York, N. Y. Press for making glass articles	810,031	Jan. 16	2857	590–1	120	711
Brooks, Byron A., Brooklyn, N. Y., assignor to Union Typewriter Company, Jersey City, N. J. Type-writing machine	812,782	Feb. 13	2514	553	120	2076
Brooks, Edward J., East Orange, N. J. Seal-press	813,079	Feb. 20	3115	683	120	2255
Brooks, Everett W. (See Hildebrandt, Charles T., assignor.)						
Broomall, Edgar W., Rochester, N. Y. Bearing for vertical shafts	809,280	Jan. 9	1349	274	120	331
Broomall, Edgar W., Rochester, N. Y. Centrifugal cream-separator	809,355	Jan. 9	1499	304	120	365
Brosius, Samuel G., Washington, D. C. Safety-razor	809,604	Jan. 9	2023	419	120	476
Brosius, Samuel G., Washington, D. C. Safety-razor	810,709	Jan. 23	4275	896	120	1056
Brower, Ernest C., and J. D. H. Schuls, Brooklyn, N. Y. Folding stair-chair	812,013	Feb. 6	978	213–14	120	1688
Brower, William, assignor of one-half to M. P. Seibel, Manlius, Ill. Cutting and reaming knife	812,325	Feb. 13	1647	362	120	1901
Brown, Alexander E., assignor to Brown Hoisting Machinery Company, Cleveland, Ohio. Grab-bucket	808,630	Jan. 2	20	5	120	7
Brown, Alexander T., Syracuse, N. Y. Propeller	810,032	Jan. 16	2863	591–2	120	712
Brown, Alexander T., assignor to Brown-Lipe Gear Company, Syracuse, N. Y. Steering device	809,171	Jan. 2	1078	225	120	237
Brown, Andrew J., Chicago, Ill. Corn-planter	810,103	Jan. 16	3009	627	120	746
Brown, Augustus, Elgin, Ill. Chronometer-escapement	808,631	Jan. 2	21	5–6	120	7
Brown, Benjamin S., Altoona, Pa. Center-stem guide for car-bodies	812,720	Feb. 13	2407	527–8	120	2053
Brown, Benjamin S., Altoona, Pa. Draft-rigging mechanism for cars	812,721	Feb. 13	2409	528	120	2054
Brown, Calvin S., Toledo, Ohio, and J. N. Clouse, St. Louis, Mo. Spirit-level	809,275	Jan. 2	1330	270	120	293
Brown, Charles C., West Greensburg, Pa. Rail-joint	811,369	Jan. 30	5592	1168	120	1374
Brown, Charles F., trustee. (See Coy, Frederick W., assignor.)						
Brown, De Witt G., American Falls, Idaho. Label-holder	812,634	Feb. 13	2248	488	120	2022
Brown, Ebenezer C. (See Williams and Brown.)						
Brown, Edward G., Glenellen, Cal. Folding box	813,347	Feb. 20	3649	800	120	2367
Brown, Edward T., assignor to Owosso Manufacturing Company, Owosso, Mich. Window-screen	812,813	Feb. 20	2584	567	120	2138
Brown, Euthaddeus I., Princess Anne, Md. Apparatus for printing photographs	810,907	Jan. 30	4681	976	120	1175
Brown, George, and G. Taylor, Ladd, Ill. Shaft-gate	812,814	Feb. 20	2585	568	120	2138
Brown, George H., Norfolk, Va. Machine for making veneer-stave barrels	811,031	Jan. 30	4931	1029	120	1232
Brown, George M., Otto, N. Y. Computing device	809,605	Jan. 9	2026	420	120	477
Brown, Herbert S. (See Sittmann, Gustav, assignor.)						
Brown, Herbert S., New York, N. Y. Oscillating electric fan	809,356	Jan. 9	1501	304	120	365
Brown Hoisting Machinery Company. (See Brown, Alexander E., assignor.)						
Brown, James H., St. Charles, assignor of one-half to H. D. Kirk, Chicago, Ill. Fence	809,906	Jan. 9	2572	532	120	598
Brown, James T., New York, N. Y. Folding phonograph-horn	811,900	Feb. 6	703	154	120	1634
Brown, James T., New York, N. Y. Phonograph-horn	813,999	Feb. 27	4937	1092	120	2704
Brown, James W., Minneapolis, Minn. Automatic pressure-retainer	808,811	Jan. 2	372	80	120	82
Brown, John H., and C. Franciscus, Pittsburg, Pa. Fire-escape	813,139	Feb. 20	3251	715	120	2285
Brown-Lipe Gear Company. (See Brown, Alexander T., assignor.)						
Brown, Nathaniel H., assignor to Williams, Brown & Earle, Philadelphia, Pa. Pantograph	809,346	Jan. 2	1267	257–8	120	280
Brown, R. T. (See Offutt, John W., assignor.)						
Brown, Robert A., Chicago, Ill. Life-boat	812,815	Feb. 20	2586	568	120	2138
Brown & Sharpe Manufacturing Company. (See Gabriel, Charles R., assignor.)						
Brown and Sharpe Manufacturing Company. (See Thacher, John J., assignor.)						
Brown and Sharpe Manufacturing Company. (See Wingo, Richard T., assignor.)						
Brown, Silas B., Cincinnati, Ohio. Time-controlled damper	808,806	Jan. 2	548	121	120	121
Brown, William H., Indianapolis, Ind. Heater	811,273	Jan. 30	5412	1129	120	1335
Brown, William H., Lockhart, Tex. Photographic-printing device	812,816	Feb. 20	2588	569	120	2139
Brown, William M., Gibsonburg, Ohio. Hoisting-machine	808,632	Jan. 2	22	6	120	8
Brown, William V., Berwick, Canada. Shingling-hatchet	812,403	Feb. 13	1799	394	120	1931
Browne, Richard B., New York, assignor to Richey, Browne & Donald, Brooklyn, N. Y. Door-hanger	813,309	Feb. 27	3765	827	120	2450
Browning, John M., Ogden, Utah. Recoil-brake for automatic guns	812,226	Feb. 13	1648	362	120	1901
Browning, Tillie J., Philadelphia, Pa. Eye for garment-hooks	813,140	Feb. 20	3253	715	120	2285
Brownsville Glass Company. (See Harvey, George H., assignor.)						
Brownsville Glass Company. (See Spear, James R., assignor.)						
Brownsville Glass Company. (See Spear and Harvey, assignors.)						
Brühl, Ernst, Berlin, Germany. Powder for dusting patterns in foundries	811,477	Jan. 30	5774	.....	120	1411
Brundage, Robert K., *et al.* (See Torst, William, Jr., assignor.)						
Brundage, T. J., *et al.* (See Torst, William, Jr., assignor.)						
Brunner, Josef, Pinegrove, Mont. Animal-call	813,853	Feb. 27	4060	1031	120	2647
Brunner, Margaret A., New York, N. Y. Umbrella attachment	809,551	Jan. 9	1904	395	120	451
Brush, William, Weehawken, N. J. Dental can	811,370	Jan. 30	5593	1168	120	1374
Bryan, John H. B., Buffalo, N. Y., assignor to Niles-Bement-Pond Company, Jersey City, N. J. Clutch mechanism	812,817	Feb. 20	2592	569	120	2139
Bryant, John M., and J. B. Allen, Detroit, Mich. Closet-bowl seat	812,490	Feb. 13	1932	426	120	1960
Bryant, Niles, Battle Creek, Mich. Tuning instrument	813,760	Feb. 27	4475	988	120	2607
Bryant, Warren S., Adhall, assignor of one-half to C. C. Dockery, Cameron, Tex. Hay-press power	808,633	Jan. 2	27	6	120	8
Bubar, John H., Denver, Colo. Shipping-crate	813,944	Feb. 27	4838	1068	120	2653
Bubenheim, Henry J., Pittsburg, Pa. Roller-table	811,820	Feb. 6	536	119	120	1599
Buccieri, Benedetto, Sharpeburg, assignor of one-half to V. De Luca, Pittsburg, Pa. Safety device for oil-cans	809,281	Jan. 9	1350	274	120	332
Buchanan, Archibald, Jr., New York, N. Y. Floor-flange for water-closet bowls	812,542	Feb. 13	2081	455	120	1990
Buchanan, John A., Pittsburg, Pa. Swingletree	809,760	Jan. 9	2338	483	120	545
Bucher, Bertram H., assignor to J. A. Jeffrey, Columbus, Ohio. Conveyer	811,125	Jan. 30	5092	1065–6	120	1265
Buck, Taylor S., New York, N. Y. Stamp	808,812	Jan. 2	374	80	120	83
Buckeye Lubricating Company. (See Fickes, John C., assignor.)						
Buckham, George T. (See Dawson and Buckham.)						
Buckland, Edward S., assignor of one-half to W. J. Haskin, Binghamton, N. Y. Envelop-moistener	811,478	Jan. 30	5775	1209	120	1411

Bulley, Louis T., New Haven, Conn. Shade-roller	808,722	Jan. 2	200	43	120	46
Bullock, John H., Millerton, Kans. Stacker for grain or the like	812,014	Feb. 6	980	214	120	1689
Bunce, William H., Jersey City, N. J., assignor to Woolworth & Graham, New York, N.Y. Postal-card printing and banding machine	812,180	Feb. 13	1350	294	120	1833
Burcham, Andrew J., Kelso, Wash. Dredge	810,710	Jan. 23	4276	887	120	1056
Burchardi, Bernhard T., Brooklyn, N. Y. Fluid-brake mechanism	811,198	Jan. 30	5268	1102	120	1303
Burdick, John, Fort Shaw, Mont. Bouquet-holder	809,172	Jan. 2	1081	225	120	238
Burger, Frans, and H. M. Williams, Fort Wayne, Ind.; said Burger assignor of one-half to said Williams. Fire-box	809,247	Jan. 2	1270	258	120	280
Burke, Charles G., Brooklyn, N. Y., assignor of one-half to J. Q. A. Whittemore, Boston, Mass. Telephone	809,423	Jan. 9	1661	341	120	397
Burke, Frank. (See Rink, William E., assignor.)						
Burke, Nathan L., Benton Harbor, Mich. Dental compress	811,479	Jan. 30	5776	1209	120	1411
Burke, Thomas F., and T. L. Vallely, Newcastle, Pa. Return-ball	810,613	Jan. 23	4115	849	120	1020
Burkhart, George W. (See Hartman, Noble W., assignor.)						
Burkholder, Isaac R., Dayton, Ohio, assignor of one-half to C. N. Heist, Cisnapark, Ill. Gate	811,371	Jan. 30	5593	1168	120	1374
Burley, Franklin G., Boston, Mass. Jar-closure	813,276	Feb. 20	3493	770	120	2335
Burlich, Henry, New York, N. Y. Rotary engine	813,854	Feb. 27	4661	1031	120	2647
Burnham, Williams & Company. (See Ehle and Nice, assignors.)						
Burns, Frederick W., Boston, Mass. Game apparatus	809,606	Jan. 9	2028	420	120	477
Burns, Henry C. (See Houston, Burns, and Van Voorhees.)						
Burr, Ellis M., Champaign, Ill. Changeable-speed gearing	813,770	Feb. 27	4477	968–9	120	2607
Burrell, Henry, Glasgow, Scotland. Cover for ships' hatchways	810,185	Jan. 16	3168	656–7	120	776
Burrowes, Darrington E. (See Spear, Murray H., assignor.)						
Burrows, Alexander, Woodward, Okla. Ter. Whip-operating device	813,401	Feb. 27	3767	827	120	2450
Burrows, George, Liverpool, England. Dress-placket fastener	813,945	Feb. 27	4839	1068	120	2683
Bury, John, assignor of one-half to J. E. Munson, New York, N. Y. Telegraphy and telegraph apparatus	811,127	Jan. 30	5097	1066–8	120	1266
Burson, Abraham. (See Rodney, Ford, Conroy, Burson, and Fitch.)						
Burt, Albert J. (See Thoeni, Herman, assignor.)						
Burt Company. (See Hoyt and Gaven, assignors.)						
Burt, Eli A., and H. Harris, New York, N. Y. Clasp for hatbands	811,126	Jan. 30	5096	1066	120	1266
Busch, Horace L., De Queen, Ark. Churn-operating mechanism	812,819	Feb. 20	2595	570	120	2140
Busch, John G., Potter Valley, Cal. Ax holster and guard	810,614	Jan. 23	4116	850	120	1020
Bush, James F., Springfield, Mass. Wicket-valve	813,771	Feb. 27	4483	969	120	2609
Bush, Samuel P., Columbus, Ohio. Car-coupling	810,104	Jan. 16	3011	627	120	747
Bushong, Ivan. (See Caldwell and Bushong.)						
Busa, George W., Woburn, Mass. Folding step-ladder	811,616	Feb. 6	160	36	120	1520
Butler, Blannie C., Asheville, N. C. Cotton-chopper	811,530	Jan. 30	5876	1232	120	1432
Butler, George M., and C. G. Ehringer, Washburn, Ill. Eaves-trough clamp	812,404	Feb. 13	1800	394	120	1932
Butler, James F., Scranton, Pa. Fire-escape	810,615	Jan. 23	4117	850	120	1020
Butman, Thomas R., Lake Bluff, Ill. Steam-generator	809,282	Jan. 9	1351	274–5	120	332
Butta, Richard. (See Jokseh and Pettfk, assignors.)						
Büttner, Max, Wilmersdorf-Berlin, Germany. Asymmetric cell	809,770	Jan. 9	2334	483	120	545
Burton, Brook L., *et al.* (See Byrd, William P., assignor.)						
Buxton, George A., *et al.* (See Byrd, William P., assignor.)						
Buyten, Hermann, Düsseldorf, Germany. Folding table	810,616	Jan. 23	4120	850–1	120	1020
Bye, Martin, Worcester, Mass., assignor to Harrington & Richardson Arms Company. Recoil-operated firearm	812,015	Feb. 6	982	214–16	120	1689
Bye, Martin, Worcester, Mass., assignor to Harrington & Richardson Arms Company. Handle for firearms	812,016	Feb. 6	987	216	120	1690
Byor, Gustav A., Edgar, Nebr. Mold	811,032	Jan. 30	4934	1029–30	120	1233
Byram, William S. (See James, McAllister, and Byram.)						
Byrd, William P., assignor of two-thirds to G. A. Buxton, Baltimore, and B. L. Buxton, Frederick county, Md. Car-replacer	813,855	Feb. 27	4664	1032	120	2648
Byrnes, Clarence P., Pittsburg, Pa. Sectional case	810,033	Jan. 16	2866	592	120	713
C. B. Cottrell & Sons Company. (See Cottrell, Charles P., assignor.)						
Cachat, Peter J., Louisville, Ohio. Window-sash pivot	811,531	Jan. 30	5877	1232	120	1433
Cade, Enos B., Seattle, Wash. Tide power	811,762	Feb. 6	423	93	120	1578
Cadillac Cabinet Company. (See Johnson, Henry, assignor.)						
Cage, William E., Hoben Solms, La. Chain sling and trip	813,277	Feb. 20	3495	770	120	2335
Cagle, Carter M., Beckville, Tex. Machine for forming round cotton-bales	809,283	Jan. 9	1354	275–6	120	333
Cagle, Carter M., Beckville, Tex. Bale-tying machine	810,521	Jan. 23	3927	808–9	120	979
Cahill, John, Norfolk, Va. Rolling door or shutter and means for operating the same	812,722	Feb. 13	2411	528–9	120	2054
Cahn, Helen W., New York, N. Y. Hose-supporter	813,197	Feb. 20	3346	736	120	2304
Caillouet, Nicholas. (See Robichaux, Caillouet, and Delhaye.)						
Cain, William S., Chicago, Ill. Computing measuring vessel	809,091	Jan. 2	945	196	120	208
Cain, Wright W., Kosciusko, Miss. Wagon attachment	809,488	Jan. 9	1788	370	120	426
Caise, Frank C., Cleveland, Ohio. Interior concrete structural work	809,090	Jan. 2	943	195	120	208
Calder, James, assignor of one-half to G. S. Bingham, Hamilton, Canada. Shocking attachment for harvester-binders	810,186	Jan. 16	3170	657–9	120	776
Calder, Warren H. (See Davis, Edward F., assignor.)						
Caldwell, John A., Montclair, N. J. Mechanical stoker	812,635	Feb. 13	2246	468–9	120	2022
Caldwell, John D., and I. Bushong, Seattle, Wash. Shingle-trimming machine	813,946	Feb. 27	4841	1068	120	2684

Carpenter, Frederick F. (See Carpenter, Francis W., assignor.)						
Carpenter, George T., Chicago, Ill. Dental tool for removing crown-pins	812,976	Feb. 20	2913	642	120	2210
Carpenter, Henry A., Sewickley, Pa., assignor to Riter-Conley Manufacturing Company, Jersey City, N. J. Conveyer for coke-retorts	812,977	Feb. 20	2914	642	120	2210
Carpenter Paper Company. (See Rudolph, Frank E., assignor.)						
Carrier, Willis H., assignor to Buffalo Forge Company, Buffalo, N. Y. Apparatus for treating air	808,897	Jan. 2	849	122	120	121
Carriker, William M., Irving, Ill. Neck-yoke	812,822	Feb. 20	2599	571	120	2141
Carroll, Charles E., Newport, Ark. Non-refillable bottle	812,724	Feb. 13	2416	530	120	2055
Carroll, Samuel T., Crothers, Pa. Metallic railway-tie	810,321	Jan. 16	3473	718	120	841
Carter, Albert, Los Angeles, Cal., assignor to Solar Furnace and Power Co. Solar furnace	811,274	Jan. 30	5414	1129	120	1336
Carter, Clarence W., Minneapolis, Minn. Machine for icing cake and other pastry	813,857	Feb. 27	4067	1032–3	120	2648
Carter, Edwin K., New York, N. Y., assignor to Kuttowait Butter Cutter Company. Machine for cutting butter, &c	813,858	Feb. 27	4671	1033–4	120	2649
Carter, Floyd H., Beloit, Wis. Wire-stretcher	813,859	Feb. 27	4679	1034	120	2651
Carter, George J., Kenton, Ohio. Prison-door-locking mechanism	812,637	Feb. 13	2253	489–90	120	2023
Carter, Henry W. (See Friede, Samuel M., assignor.)						
Carter, James, Stalybridge, G. Hall, Manchester, and A. Parsons, Leeds, England. Automatic circuit-breaking safety appliance for use in trolley-wire systems for electric traction	811,822	Feb. 6	539	120	120	1600
Carter, W. F., *et al.* (See Liesmann, Louis, assignor.)						
Carter, William D., Quincy, Ill. Kinetoscope for advertising	813,860	Feb. 27	4680	1034	120	2651
Carver, Thomas A. B., Glasgow, Scotland. Warp stop-motion	811,373	Jan. 30	5598	1169	120	1375
Cary Safe Company. (See Kasselman, William J., assignor.)						
Casaday, William L., and A. Bergman, South Bend, Ind. Annealing or malleableizing oven	813,483	Feb. 27	3932	863	120	2489
Case, Charles W., Jr., New Orleans, La. Feeding and blending machine	811,482	Jan. 30	5781	1210	120	1413
Case, Frank E., Schenectady, N. Y., assignor to General Electric Company. Emergency operating means for reversing-switches	809,773	Jan. 9	2342	484	120	547
Case, Frank E., Schenectady, N. Y., assignor to General Electric Company. System of control	809,774	Jan. 9	2344	484	120	547
Case, Frank E., Schenectady, N. Y., assignor to General Electric Company. System of control	809,908	Jan. 9	2575	533	120	598
Case, Frank E., Schenectady, N. Y., assignor to General Electric Company. Surface-contact system	812,726	Feb. 13	2417	530	120	2055
Case, Henry, Gloversville, N. Y. Hinged-leaf button	811,901	Feb. 6	704	154	120	1634
Case, John M., Cincinnati, Ohio. Bolting-machine	808,724	Jan. 2	326	44	120	47
Case, John M., Cincinnati, Ohio. Gradual-reduction mill	811,128	Jan. 30	5120	1069–70	120	1271
Case, John M., Louisville, Ky. Package and letter delivering and collecting system	813,542	Feb. 27	4048	886–8	120	2516
Case, Rolland A. (See Cloth and Case.)						
Casella, Secondo L., assignor to W. F. Barnes Commercial Company and B. F. Mackall, San Francisco, Cal. Automatic basket-machine	813,773	Feb. 27	4490	990–2	120	2610
Casey Bros. (See Omalia, Mathew, assignor.)						
Casey, Dennis D., Springfield, Mass. Tank-valve	811,034	Jan. 30	4936	1030	120	1233
Cassella Color Company. (See Kalischer, Georg, assignor.)						
Cassels, Louis J. (See McCain, John A., assignor.)						
Casserly, Joseph E., New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Boltwork for circular looms	811,695	Feb. 6	320	69	120	1556
Casserly, Joseph E., New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Boltwork for circular looms	811,696	Feb. 6	321	70	120	1556
Casserly, Joseph E., New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Boltwork for circular looms	811,697	Feb. 6	321	70	120	1557
Casserly, Joseph E., New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Boltwork for circular looms	811,698	Feb. 6	322	70	120	1557
Casserly, Joseph E., New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Boltwork for circular looms	811,699	Feb. 6	323	70	120	1557
Casserly, Joseph E., New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Boltwork for circular looms	811,700	Feb. 6	323	71	120	1557
Casserly, Joseph E., New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Boltwork for circular looms	811,701	Feb. 6	324	71	120	1558
Cassidy, Mars, Washington, D. C. Portable starting-gate for race-courses	808,813	Jan. 2	375	81	120	83
Castle, Peter C. D., Bebington, England. Manufacture of artificial mother-of-pearl	809,909	Jan. 9	2592	.....	120	603
Caswell, William A., assignor, by mesne assignments, to National Coal Dump Car Company, Chicago, Ill. Car. (Reissue)	12,447	Feb. 6	1321	267–9	120	1760
Cates, Robert S., Kingman, Kans. Ice-machine	808,898	Jan. 2	551	122	120	121
Cathey, Albert M., Davidson, N. C. Transferring apparatus	812,638	Feb. 13	2255	490	120	2023
Catlett, Robert, *et al.* (See Birmingham, John P., assignor.)						
Catlin, William, and M. McMillan, Kansas City, Mo. Carriage for display-racks	810,909	Jan. 30	4683	977	120	1175
Caulfield, Frank P., *et al.*, executors. (See Creque, Allen P.)						
Caughey, Albert S., Omaha, Nebr., assignor of one-half to J. Freese and S. W. Creel, Council Bluffs, Iowa. Lighter	808,725	Jan. 2	209	45	120	48
Cavanaugh, Patrick W. (See Shaffer, Francis F., assignor.)						
Cawood, Walter E., Toledo, Ohio. Eyeglasses	810,368	Jan. 16	3572	734	120	864
Caywood, Walter L., and E. M. Steele, Canon City, Colo. Music-leaf turner	813,617	Feb. 27	4197	921	120	2547
Cedervall, Carl W., administrator. (See Cedervall, Frans R.)						
Cedervall, Frans R., deceased; C. W. Cedervall, Gothenburg, Sweden, administrator. Protecting-sleeve for screw-propeller shafts	810,187	Jan. 16	3180	659	120	779
Celenza, Aristodemo and D., New York, N. Y. Bottle-closure	813 198	Feb. 20	3348	736	120	2305
Celenza, Domenico. (See Celenza, Aristodemo and D.)						
Cerruti, Antonio, assignor to California Fruit Canners Association, San Francisco, Cal. Can-filling apparatus	810,034	Jan. 16	2899	593	120	714
Chadeloid Chemical Company. (See Ellis, Carleton, assignor.)						
Chadwick, Edward W., Edgartown, Mass. Glass-cutting board	811,201	Jan. 30	5272	1103	120	1304
Chalfant, Walter B. (See Davis, James L., assignor.)						
Chamberlain, Arthur. (See Chamberlain, William and A.)						
Chamberlain, Leander T. (See Turner, Isaac J., assignor.)						
Chamberlain, William and A., Wigston Magna, England. Brake for the hubs of cycles	811,617	Feb. 6	162	36	120	1530
Chambers, James A., assignor to W. J. Patton, Allegheny, Pa. Apparatus for drawing glass	810,035	Jan. 16	2872	593	120	715
Champion Machinery Company. (See Meyer, Ernest C., assignor.)						
Champion Metal Weather Strip and Parting Bead Company. (See Faulkner, Charles H., assignor.)						
Champion Shoe Machinery Company. (See Corcoran and Dobyne, assignors.)						
Chaney, Christopher C., Hartford, Ala. Glass-retaining device for mashes	811,544	Feb. 6	19	5	120	1489
Chandler, William E., Elcampo, Tex. Calf-weaner	809,775	Jan. 9	2348	485	120	548
Chaney, John K., *et al.* (See Driver, Charles H., assignor.)						
Channell, George H., assignor to Union Spring and Manufacturing Co., New Kensington, Pa. Spring end	809,173	Jan. 2	1082	226	120	238
Chapman, Henry S., Glenridge, N. J., and W. M. Stone, New York, N. Y., assignors to Arlington Company. Coated strip and making the same	813,618	Feb. 27	4199	922	120	2548
Chapman, Matthew T., Aurora, Ill. Well-sinking apparatus	810,910	Jan. 30	4685	977–8	120	1176
Chapman, Robert E., Colorado City, Colo. Triple valve	809,491	Jan. 9	1792	370	120	427
Chard, Nicholas D. (See Lodge and Chard.)						
Charles Parker Company. (See Walker, Eli M., assignor.)						
Charpentier, Edmond, and J. Richelle, Verviers, Belgium. Heddle-making machine	809,668	Jan. 9	2145	444–5	120	502
Chase, Amos F., Lynn, Mass. Shirt	813,774	Feb. 27	4495	992–3	120	2611
Chase, James L., Ayer, Mass., assignor of one-half to E. A. Terrell, Nashua, N. H. Portable measuring-can	813,402	Feb. 27	3769	827	120	2451
Chase, James W., Buffalo, N. Y. Wall-plaster	812,978	Feb. 20	2915	.....	120	2211
Chatem, John E., Los Angeles, Cal. Folding bed	810,036	Jan. 16	2874	593	120	715
Cheek, Frank. (See Holsberg, Dean A., assignor.)						
Cheesman, Charles H., Burlington, N. J. Making stiffening material	812,639	Feb. 13	2257	.....	120	2024
Cheever, Murray, assignor to E. Howard Clock Company, Boston, Mass. Electromagnetic motor	813,775	Feb. 27	4496	993	120	2611
Chemische Fabrik von Heyden Aktiengesellschaft. (See Seifert, Bruno R., assignor.)						
Chenoweth, Walter B. (See Parks, Thomas W., assignor.)						
Chester, John F., assignor of thirty-five one-hundredths to J. J. Selberz, Louisville, Ky. Mail-bag catcher	810,322	Jan. 16	3474	718	120	841
Cheyne, Samuel D., Belfast, Ireland. Apparatus for measuring and marking the distance from the ground of skirts, &c	809,669	Jan. 9	2156	446	120	505

Cooper, John, Bellevue, Pa., assignor to Ingersoll-Sergeant Drill Company, New York, N. Y. Automatic oiler	810,621	Jan. 23	4128	853	120	1022
Cooper, Thomas, Kidderminster, England. Tufted pile fabric	812,951	Feb. 27	4847	1070	120	2685
Cooper, William, Denver, Colo. Safety device for hoisting mechanisms	810,189	Jan. 16	3182	650-60	120	780
Cooper, William, Providence, R. I. Union	810,190	Jan. 16	3188	660	120	780
Coppage, Benjamin D., Wilmington, Del. Slide-rule	813,485	Feb. 27	3935	864	120	2490
Corbin, Charles B., assignor of one-half to C. F. Aupperle, Grand Rapids, Mich. Shoe-form	812,116	Feb. 6	1186	254	120	1724
Corbin, John R., New York, N. Y. Adjustable door-jamb	813,600	Feb. 27	4334	953	120	2578
Corbin, Newell S. (See Rahm and May, assignors.)						
Corbin Screw Corporation. (See Glover, Charles, assignor.)						
Corbin Screw Corporation. (See Svenson, Charles W., assignor.)						
Corby, Edward P., assignor to Lock-Well Wall Register Company, St. Louis, Mo. Wall-register	813,952	Feb. 27	4848	1070	120	2685
Corcoran, George L., and G. A. Dobyns, assignors to Champion Shoe Machinery Company, St. Louis, Mo. Wax-pot for sewing-machines	809,428	Jan. 9	1672	342	120	399
Corcoran, George L., and G. A. Dobyns, assignors to Champion Shoe Machinery Company, St. Louis, Mo. Sewing-machine	812,641	Feb. 13	2259	491-2	120	2024
Corcoran, John H., Kenosha, Wis. Combined sash-balance and lock	811,382	Jan. 30	5616	1175	120	1379
Corey, Fred B., Schenectady, N. Y., assignor to General Electric Company. Electromagnet	811,277	Jan. 30	5420	1130	120	1337
Corey, Fred B., Schenectady, N. Y., assignor to General Electric Company. Air-brake system and automatic valve	811,765	Feb. 6	428	94	120	1580
Corey, Fred B., Schenectady, N. Y., assignor to General Electric Company. System of motor control	811,766	Feb. 6	431	94	120	1580
Corley, Benjamin R. (See Turner and Corley.)						
Cormack, George, Jr., and F. C. Zumdahl, Rockford, Ill. Sparking igniter for explosive-engines	813,081	Feb 20	3119	663	120	2256
Cornelison, Jesse U., Eula, Tex. Agricultural implement	810,622	Jan. 23	4130	853	120	1023
Cornell, Joseph, Earlville, N. Y. Table-leg fastening	813,406	Feb. 27	3777	826	120	2453
Corning Glass Works. (See Churchill, William, assignor.)						
Cortland Implement Company. (See Johnson, Charles, assignor.)						
Cosmos Construction Company. (See Lamson, Franklin S., assignor.)						
Cossey, Myron, Brooklyn, assignor to Reliance Ball Bearing Door Hanger Company, New York, N. Y. Door-hanger	809,781	Jan. 9	2355	486	120	550
Costello, Thomas H., Chicago, Ill. Blackboard	810,623	Jan. 23	4131	853	120	1023
Cotton Collar Company. (See Allen, Clarence L., assignor.)						
Cotton, William E., and L. C. Moor, Kansas City, Mo. Extension gas-chandelier	812,549	Feb. 13	2093	459	120	1993
Cottrell, Charles P., Westerly, R. I., assignor to C. B. Cottrell & Sons Company, New York, N. Y. Pressure-controlling device for the air-springs of printing-presses	810,624	Jan. 23	4132	854	120	1023
Cottrell, Herbert, Newark, N. J. Mechanical and magnetic toy	813,082	Feb. 20	3120	664	120	2256
Cottrell, John C., Kingsley, Iowa. Railway-car	808,817	Jan. 2	361	83-4	120	84
Couch, Elbert M., assignor to Whitney Manufacturing Company, Hartford, Conn. Printing-press	813,778	Feb. 27	4501	994-5	120	2612
Country Hydrant Company. (See Johnson, John, assignor.)						
Coupette, Paulin, Cologne, Germany. Advertising device	813,300	Feb. 20	3351	737	120	2305
Covel Manufacturing Company. (See Filstrup, Lars L., assignor.)						
Covell, Harry N., New York, N. Y., assignor to Lidgerwood Manufacturing Company. Drake-band	812,827	Feb. 20	2615	573	120	2145
Covarrubias, Samuel T., Mount Pleasant, Mich. Rail-joint	811,130	Jan. 30	5128	1071	120	1272
Covert, James C., Watervliet, N. Y. Fire-escape	809,670	Jan. 9	2156	446	120	506
Cowan, Arthur S., assignor to Crompton & Knowles Loom Works, Worcester, Mass. Loom	814,000	Feb. 27	4930	1092-4	120	2704
Cowern, William, Hawera, New Zealand. Means for filtering or purifying water	813,779	Feb. 27	4505	995	120	2613
Cowing, Percy F., New York, N. Y. Shot-making machine	809,671	Jan. 9	2158	446	120	506
Cowles, Burton S., Plainville, assignor to Cowles Engineering Corporation, New Haven, Conn. Machine for bending cast-iron	813,141	Feb. 20	3254	715	120	2285
Cowles Engineering Corporation. (See Cowles, Burton S., assignor.)						
Cowles, William B., assignor to "Long Arm" System Company, Cleveland, Ohio. Automatic cut-out mechanism for electrically-operated bulkhead-doors	810,915	Jan. 30	4705	982	120	1181
Cowles, William H., et al. (See Williams, Charles, assignor.)						
Cox, George E. (See Price, Cox, and Marshall.)						
Coy, Frederick W., Boston, assignor to C. F. Brown, trustee, Reading, Mass. Adjustable clutch-controlled standard	811,278	Jan. 30	5423	1130	120	1338
Crabb, Charles L., New York, N. Y. Apparatus for rendering drawings and documents transparent and waterproof	808,901	Jan. 2	357	123	120	122
Craft, Edward B. (See McBerty and Craft.)						
Craig, Allen, and E. Double, Los Angeles, Cal. Well-drilling apparatus	811,905	Feb. 6	715	156-6	120	1636
Craig, James, and R. E. Rowan, Parnassus, Pa. Apparatus for flattening glass	810,723	Jan. 23	4208	894	120	1062
Cram, Walter W., Sheldon, Iowa. Decoy	811,036	Jan. 30	4989	1031	120	1224
Cramer, Charles W., and H. C. Haak, Scranton, Pa. Motor	810,206	Jan. 23	3671	756-7	120	919
Cramer, John, assignor of one-half to T. Feist, Lima, Ohio. Curtain-fixture	813,886	Feb. 27	4686	1036	120	2652
Cramer, Stuart W., Charlotte, N. C. Automatic indicating and regulating hygrometer	809,672	Jan. 9	2161	447	120	507
Cramer, Stuart W., Charlotte, N. C. Hygrometer for regulating humidifying and heating systems	811,363	Jan. 30	5617	1175-6	120	1379
Cramer, Stuart W., Charlotte, N. C. Electrically-controlled regulating-valve for humidifying and heating systems	813,063	Feb. 20	3121	664	120	2257
Crandall Construction Co. (See Crandall, Lucius S., assignor.)						
Crandall, Lucius S., assignor to Crandall Construction Co., Brooklyn, N. Y. Mechanical calculator and recorder	813,261	Feb. 20	3503	773-4	120	2337
Crandall, Nathan W., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn. Valve for door-checks	811,530	Feb. 6	540	121	120	1602
Crandall, Nathan W., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn. Lock and latch mechanism	812,826	Feb. 20	3617	573	120	2145
Crandall, Nathan W., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn. Door check and closer	812,829	Feb. 20	3620	573-4	120	2146
Crane, Charles R., Seattle, Wash. Automatic recording ice-scale	809,439	Jan. 9	1673	343-4	120	400
Crane Company. (See Hayden, James T., assignor.)						
Crane Company. (See Kreuter, Henry, assignor.)						
Crane Company. (See Rother, John L., assignor.)						
Crane, George W., Vandenburg, Ind. Shoulder-loader	808,972	Jan. 2	704	133-3	120	155
Crane, George W., Vandenburg, Ind. Dumping-wagon	808,973	Jan. 2	705	153	120	155
Crane, James D., Aledo, Tex. Separator	810,985	Jan. 23	4135	854	120	1024
Crane, Newton, assignor to Newton Crane Gas Engine Company, Boston, Mass. Gas-engine	808,902	Jan. 2	359	123-4	120	122

Alphabetical list of patentees for January and February—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Cranner, Bjarne, Kongsberg, Norway. Apparatus for sorting or separating coins	812,327	Feb. 13	1649	363	120	1901
Crawford, Hezekiah H., El Paso, Tex. Lock-nut	812,185	Feb. 13	1364	296	120	1837
Crawford, Lundy O., Pendleton, assignor of one-half to J. F. Wagner, Anderson, Ind. Lubricator	810,844	Jan. 23	4523	941	120	1108
Crawford, Sherman L., Hoquiam, Wash. Railway-train-stopping device	810,916	Jan. 30	4711	983	120	1184
Crawford, William H., Cliftonforge, Va. Combined cigar cutter and lighter	809,782	Jan. 9	2357	487	120	551
Creedon, John J., Moline, Ill. Buckle	811,548	Feb. 6	23	6	120	1490
Creedon, John J., Moline, Ill. Harness	813,543	Feb. 27	4053	898	120	2517
Creel, Seth W., et al. (See Caughey, Albert E., assignor.)						
Creighton, Walter C., and C. M. Banker, Ilion, N. Y. Piano attachment	811,279	Jan. 30	5424	1130-1	120	1338
Crenshaw, William, Atlanta, Ga. Dental matrix	812,328	Feb. 13	1651	363	120	1902
Crepy, Edouard, and L. Fremaux, Brussels, Belgium. Combing and drawing machine	812,550	Feb. 13	2095	459-60	120	1993
Creque, Allen P., deceased; E. De Camp and F. P. Caufield, Newark, N. J., executors. Lavatory-fixture	812,832	Feb. 20	2624	574-5	120	2147
Creason Co., Geo. V. (See Stacks, Howard R., assignor.)						
Creveling, William C., St. Louis, Mo. Danger-signal	811,037	Jan. 30	4940	1031	120	1234
Cribbs, Charles A., and H. E. McCoy, Vandergrift, Pa. Window-fixture	810,469	Jan. 23	3824	785	120	956
Crippen, Henry M., Ballston Spa, assignor to Max Huncke Chemical Co., Brooklyn, N. Y. Embalming-catheter	812,020	Feb. 6	995	218	120	1691
Crippen, Walter, New York, N. Y., assignor to Wilcox & White Company, Meriden, Conn. Autopneumatic musical instrument	808,903	Jan. 2	564	124-5	120	124
Crombie, Herbert S., Woburn, Mass. Union-coupling	812,642	Feb. 13	2263	492	120	2025
Crommett, Herbert A., Patten, Me. Sash-balance	809,783	Jan. 9	2360	487	120	551
Crompton & Knowles Loom Works. (See Baker, Harry G., assignor.)						
Crompton & Knowles Loom Works. (See Cowan, Arthur S., assignor.)						
Crompton & Knowles Loom Works. (See Gordon, Albert A., Jr., assignor.)						
Crompton & Knowles Loom Works. (See Hollingworth, Edward, assignor.)						
Crompton & Knowles Loom Works. (See Ryon, Eppa H., assignor.)						
Crompton & Knowles Loom Works. (See Wattie, William, assignor.)						
Crompton & Knowles Loom Works. (See Wyman and Cyr, assignors.)						
Crompton, Randolph, Worcester, Mass. Harness mechanism for looms	809,933	Jan. 16	2648	547	120	667
Crompton-Thayer Loom Company. (See O'Reilly, Anthony J., assignor.)						
Cromwell, John C., Cleveland, Ohio, assignor to Garrett-Cromwell Engineering Company. Shear-table	810,845	Jan. 23	4524	942	120	1109
Cronin, Jeremiah, New York, N. Y. Dumping-vehicle	810,264	Jan. 16	3353	694	120	814
Cronstedt, Elias, St. Paul, Minn. Hydrant	812,407	Feb. 13	1805	395	120	1933
Crosby, Charles E., Gassoway, W. Va. Wire-stretcher	810,724	Jan. 23	4307	895	120	1062
Crosby, Richard M., Tacoma, Wash. Bell-ringer	810,725	Jan. 23	4308	895	120	1062
Crosbier, Van Wyck A., San Francisco, Cal. Automatic animal-feeder	811,038	Jan. 30	4943	1032	120	1235
Cross, Frank L., Mystic, Conn., assignor to Cross Paper Feeder Company, Boston, Mass. Sheet-feeding machine	812,260	Feb. 13	1506	330-2	120	1868
Cross Paper Feeder Company. (See Cross, Frank L., assignor.)						
Cross, Theodore, Washington, Ind. Mail-bag receiving and delivering apparatus	809,430	Jan. 9	1677	344	120	401
Crossland, Mortimer L., et al. (See Barry, Jefferson D., assignor.)						
Crossley, Arthur M. (See Whyte and Crossley.)						
Crossley, Francis M., Dayton, Ohio. Combination rail and tie fastener	808,904	Jan. 2	567	125	120	124
Crossley, William, West Haven, Conn. Elevator mechanism	808,637	Jan. 2	35	8	120	10
Crossley, William, West Haven, Conn. Conveyer-scoop	810,917	Jan. 30	4713	983	120	1184
Crossman, Martin R., Boston, Mass. Fountain-pen	810,327	Jan. 16	3482	720	120	843
Crouse, Huntington B., Syracuse, N. Y. Insulator	813,353	Feb. 20	3661	802	120	2369
Crow, Elmette C., assignor of one-half to A. B. McClure, Allegheny, Pa. Advertising device	813,354	Feb. 20	3663	803	120	2370
Crowley, John H., Duluth, Minn. Railway-track gage and brace	811,384	Jan. 30	5619	1176	120	1380
Crown Cork and Seal Company. (See Mack, Ernest U., assignor.)						
Crown Cork and Seal Company. (See Wood, William C., assignor.)						
Crowther, Joseph D., and A. Sykes, Huddersfield, assignors to E. Hollingworth, Dobcross, England. Picking-motion for looms	810,191	Jan. 16	3187	661	120	780
Cubbage, David. (See Hamfeldt and Cubbage.)						
Cudell, Frank E., Cleveland, Ohio. Plan for numbering streets in irregular cities	811,385	Jan. 30	5620	1176	120	1380
Culley, John S., Louisville, Ky. Building construction	812,727	Feb. 13	2422	530	120	2057
Cullinsy, John V., Lebanon, Pa. Working rolled metals	809,234	Jan. 16	2640	547	120	667
Culver, Ross A., Bristol, Conn. Implement for decorating wood	811,386	Jan. 30	5621	1176	120	1380
Cumings, Rebbecca J., Greersville, Ohio. Curtain-hanger	810,726	Jan. 23	4311	895	120	1063
Cummings, Thaddeus L., Spencer, Iowa. Automatic friction-governor in fly-wheels	809,784	Jan. 9	2362	487	120	552
Cumnock, Robert L., Anderson, S. C. Bobbin-holding means for loom-shuttles	811,620	Feb. 6	167	37	120	1522
Cunningham, Andrew C., Annapolis, Md. Floating caisson for repairing floating dry-dock bottoms	808,638	Jan. 2	36	8	120	10
Cunningham, Andrew C., Washington, D. C. Floating caisson	808,728	Jan. 2	217	46	120	50
Cunningham, Edgar W., Roselle, N. J. Door-bolt	810,918	Jan. 30	4715	984	120	1184
Cunningham, John T., Allegheny, Pa. Filter	810,846	Jan. 23	4526	942	120	1109
Cunningham, Kenneth, Cheyenne, Okla. Ter. Wire-stretcher	812,981	Feb. 20	2921	643	120	2212
Cunningham, William R. (See Wibel, Cunningham, and Gray.)						
Currier, Burleigh. (See Porter and Currier.)						
Curtain Supply Company. (See Hopkins, Charles L., assignor.)						
Curtain Supply Company. (See Houghtaling, Paul A., assignor.)						
Curtis, Frank C., Troy, N. Y., assignor to Universal Brush Company. Brush-filling machine	811,831	Feb. 6	551	122	120	1602
Curtis, Zenas A., Channing, Tex. Wire-stretcher	839,066	Jan. 2	565	126-9	120	211
Curwen, Samuel M., assignor to J. A. Brill, Philadelphia, Pa. Walk-over car-seat	808,905	Jan. 2	560	125	120	125
Cushman, Abe L., assignor to Cushman Electric Company, Concord, N. H. Induction-motor. (Reissue)	12,431	Jan. 2	1338	272	120	294
Cushman Electric Company. (See Cushman, Abe L., assignor.) (Reissue.)						
Custer, John S. (See Turner and Custer.)						
Cutler, John M., assignor of one-half to J. L. McNab, Ukiah, Cal. Bottle	810,727	Jan. 23	4312	896	120	1064
Cutting, Charles R., Raton, N. Mex. Ter. Wind-wheel	809,431	Jan. 9	1679	344-5	120	401
Cyr, Henry, Biddeford, Me., assignor to Draper Company, Hopedale, Mass. Harness-motion for looms	812,166	Feb. 6	1206	263	120	1753
Cyr, Joseph T. (See Wyman and Cyr.)						
D. M. Sechler Carriage Company. (See Englund, Ernst E., assignor.)						
D'Antony, Amedeo. (See Moreno and D'Antony.)						
Dahl, William T., Bottineau, N. D. Faucet-lock	812,021	Feb. 6	996	218	120	1691
Dahlberg, Gustaf L. B., Altwood, N. J. Easel	809,785	Jan. 9	2363	488	120	552
Dahlman, Henry E., Burlington, Wis. Weighing device	812,830	Feb. 20	2622	574	120	2146
Dalton, Alfred, Brooklyn, N. Y. Amusement device	813,263	Feb. 27	4940	1070-1	120	2688
Dalton, George T., Sr., assignor to J. B. Dalton, Washington, D. C. Automatic locking device for loose-leaf binders	810,919	Jan. 30	4716	984	120	1185

Dalton, Joseph B. (See Dalton, George T., Sr., assignor.)						
Daly, Edmund J., assignor to M. J. Daly and Sons, Incorporated, Waterbury, Conn. Furnace fire-door protector	810,728	Jan. 23	4313	896	120	1064
Damascus Brake Beam Company. (See Ettenger, Robert L., assignor.)						
Danczyge, Simon, deceased, Dayton, Ohio; S. Platau, administrator. Tag-clasp	813,407	Feb. 27	3778	829	120	2453
Daninger, Gottfried, Przemysl, Austria-Hungary. Small-arm	810,192	Jan. 16	3189	661	120	780
Darby, Thomas A., trustee. (See McCarty, William F. M., assignor.)						
Dare, William H., Whitestone, N. Y. Non-refillable bottle	811,387	Jan. 30	5622	1177	120	1381
Darley, John W., Jr., assignor to William Knabe & Company Manufacturing Company, Baltimore, Md. Self-playing piano	813,355	Feb. 20	3664	803–4	120	2370
Darley, John W., Jr., assignor to William Knabe & Company Manufacturing Company, Baltimore, Md. Self-playing piano attachment	813,356	Feb. 20	3665	804	120	2370
Darley, John W., Jr., assignor of one-half to M. Holzman, P. and L. Hamburger, Baltimore, Md. Piano-action	810,920	Jan. 30	4717	984–5	120	1185
Därrschmidt, Gustav J., Dresden-Pieschen, Germany. Adjustable holder for drawing models and the like	809,432	Jan. 9	1681	345	120	402
Daugherty, Charles C., Columbus, Ohio. Storm-front for vehicle-tops	811,039	Jan. 30	4945	1032	120	1235
Daugherty, William G., Baltimore, Md. Apparatus for applying molten solder to sheet metal, can-caps, &c	812,329	Feb. 13	1652	363	120	1902
Daum, Felix, Mains, Germany. Soap-molding machine	810,193	Jan. 16	3190	661	120	781
Davenport, Harvey M., Sheridan, Wyo. Headlight-cover	812,982	Feb. 20	2921	644	120	2212
Davey, Elijah C., Chicago, Ill. Fountain-brush	810,470	Jan. 23	3825	785	120	956
Davey, George S., Frankfort, Mich. Trace-tightener	813,866	Feb. 27	4687	1036	120	2653
David, Benjamin E. (See Mendel, Sophie, assignor.)						
David Bradley Manufacturing Company. (See Paul, William L., assignor.)						
David, Henri, Paris, France. Protector for pneumatic tires	808,974	Jan. 2	706	153	120	156
Davidge, John M., *et al.* (See Evans, Lewis J., assignor.)						
Davidson Bros. (See Strain, Charles M., assignor.)						
Davidson, George R., Lenox, Mich. Oil and feed-water separator	812,831	Feb. 20	2623	574	120	2146
Davidson, Miriam, New York, N. Y. Waterproof eyeglass-case	811,487	Jan. 30	5790	1212	120	1414
Davidson, Samuel. (See McKnight, Stephen E., assignor.)						
Davies, Charles P., Oakland, Cal. Combined table and folding bed	808,818	Jan. 2	387	84	120	86
Davis, Charles B. (See Perry, Benjamin F., assignor.)						
Davis, Edward F., assignor of one-fourth to W. H. Calder, Lynn, Mass. Shears or scissors grinding apparatus	811,202	Jan. 30	5274	1103–4	120	1305
Davis, Frank J., assignor to himself, J. C. Walker, and F. R. Taisey, Indianapolis, Ind. Non-refillable bottle	809,249	Jan. 2	1282	261	120	282
Davis, Frank S. (See Schaaf and Davis.)						
Davis, George A., Grand Rapids, Mich. Pedestal-table	810,265	Jan. 16	3354	696	120	815
Davis, George H., West Orange, N. J. Electrically actuated and controlled self-playing musical instrument	812,117	Feb. 6	1157	255	120	1724
Davis, Harry A., assignor to Draper Company, Hopedale, Mass. Picking mechanism for looms	812,495	Feb. 13	1945	429	120	1962
Davis, Herbert L., Washington, D. C. Automatic paper-perforating machine	811,621	Feb. 6	168	37–8	120	1522
Davis, Herbert W., Fall River, Mass. Loom	810,471	Jan. 23	3826	785	120	956
Davis, Herman, New Orleans, La. Trunk	809,286	Jan. 9	1360	277	120	334
Davis, James H. (See Davis, Joseph D., assignor.)						
Davis, James H., Chicago, Ill. Automatic trap or valve for draining heating systems	809,786	Jan. 9	2365	488	120	553
Davis, James L., assignor of one-fourth to W. B. Chalfant, Brazneil, Pa. Cable-grip for cars	813,040	Feb. 20	3030	667	120	2235
Davis, James W., assignor of one-half to M. E. McBee, Alto, Tex. Can-opener	809,673	Jan. 9	2162	447	120	507
Davis, John S. (See Smith and Davis.)						
Davis, Joseph D., assignor of one-half to J. H. Davis, Peachland, N. C. Combined corn-planter and fertilizer-distributer	812,963	Feb. 20	2923	644	120	2212
Davis, Martha E., Worthington, Minn. Fence structure	810,626	Jan. 23	4137	855	120	1024
Davis, Martha J., St. Joseph, Mo. Implement-holder for sewing-machines	808,639	Jan. 2	38	8	120	11
Davis Sewing Machine Company *et al.* (See Baurmann, Gustav, assignor.)						
Davis, Silas N. (See McCardle and Davis.)						
Davis, Spencer E., Minneapolis, Minn. Feeding device for seeders or drills	811,203	Jan. 30	5277	1104	120	1305
Davis, Spencer E., Minneapolis, Minn. Draft-equalizer	811,703	Feb. 6	326	72	120	1558
Davis, Spencer E., Minneapolis, assignor to Monitor Drill Co., St. Louis Park, Minn. Yielding link for seeders and other machines	811,280	Jan. 30	5425	1131	120	1338
Davis, Thomas A., Findlay, Ill. Gas-light switch	813,357	Feb. 20	3667	804	120	2371
Davis, Thomas A., Findlay, Ill. Poultry drinking-fountain	813,954	Feb. 27	4851	1071	120	2686
Davis, Thomas L., Speedwell, Tenn. Violin-bridge	809,174	Jan. 2	1084	226	120	239
Davis, William A., and W. H. Samelius, Chicago, Ill. Air-stop for windows	808,640	Jan. 2	39	9	120	11
Davison, Clarence M., Newburgh, N. Y. Drying apparatus	813,358	Feb. 20	3668	805	120	2371
Davison, George L., assignor to American Sintering Company, Chicago, Ill. Sintering comminuted ore or fine-dust	811,040	Jan. 30	4946	.....	120	1236
Davy Brothers. (See Holmes, Thomas E., assignor.)						
Daws, Henry J., Hopkins, assignor to S. N. Sorensen, Minneapolis, Minn. Pneumatic stacker	811,532	Jan. 30	5879	1232–3	120	1433
Dawson, Arthur T., and G. T. Buckham, Westminster, London, assignors to Vickers Sons & Maxim Limited, Westminster, England. Breech mechanism of ordnance	812,642	Feb. 13	2265	492–3	120	2025
Dawson, Charles, Tacoma, Wash. Truing device for flour-mill rolls	810,627	Jan. 23	4138	855	120	1025
Dawson, John, and C. O. Rosen, Chicago, Ill. Map-case	808,175	Jan. 2	1085	226	120	239
Day, Arthur M., Butte, Mont. Apparatus for smelting and converting ores	812,186	Feb. 13	1365	297	120	1837
Day, Arthur M., Butte, Mont. Smelting and converting ores	812,785	Feb. 13	2224	555	120	2079
Day, Benjamin, West Hoboken, N. J. Micrometrical adjustment for printing-film frames	813,867	Feb. 27	4688	1036–7	120	2653
Day, Maxwell W., Schenectady, N. Y., assignor to General Electric Company. System of control for electric motors	808,729	Jan. 2	218	46	120	80
De Buren, Henri G. (See Hiss and De Buren.)						
De Camp, Elphalet, *et al.*, executors. (See Creque, Allen P.)						
De Forrest, Earl J. W. and F. I., Bradner, Ohio. Hose-coupling	813,359	Feb. 20	3673	805	120	2372
De Forrest, Fred I. (See De Forrest, Earl J. W. and F. I.)						
De France, Murry A., assignor of three-fourths to A. H. Sisson, C. E. Krebs, and W. B. Wingerter, Newark, Ohio. Brake and track-sanding mechanism	813,691	Feb. 27	4335	954	120	2677
De Grody, Martin M., St. Louis, Mo. Coffee-pot	808,730	Jan. 2	222	47	120	51
De Hart, William. (See Holloway, Henry C., assignor.)						
De La Rue and Company, Thomas. (See Sweetser, George, assignor.)						
De Lay, Charles, assignor of two-thirds to A. B. Hunt and C. J. Collins, Omaha, Nebr. Pipe-laying device	809,910	Jan. 9	2593	534	120	608
De Leeuw, Adolph L., Hamilton, Ohio. Speed-controlling system	813,301	Feb. 20	3354	737–8	120	2305
De Long Hook and Eye Company. (See Jones, Lora, assignor.)						
De Luca, Vincenzo. (See Benzieri, Benedetto, assignor.)						
De Moss, Charles E., Indianapolis, assignor of one-half to E. F. Barker, Franklin, Ind. Trucking device for slaughter-house travelers	808,819	Jan. 2	369	84	120	86

Alphabetical list of patentees for January and February—Continued.

De Phillippi, John. (See Herrington, Jacob, assignor.)						
De Trey & Sons, E. (See Birt, Charles S., assignor.)						
De Vito, Angelo, New York, N. Y. Machine for making flat macaronis	812,704	Feb. 13	2373	520	120	2046
De Vito, John A., Roxbury, Mass. Variable-speed device	812,729	Feb. 13	2424	531	120	2057
De Wallace, Harry, Watertown, N. Y. Ventilating apparatus	811,832	Feb. 6	552	122	120	1602
De Witt, Emma. (See Story, Milton W., assignor.)						
Deadman, John F. (See Pemberton and Deadman.)						
Deal, Stephen F. (See Ross and Deal.)						
Dean Electric Company. (See Beyland, Sidney A., assignor.)						
Dean, Theodore S., *et al.* (See Wilcox, William W., assignor.)						
Dean, William, Memphis, Tenn. Coffee cooler and stoner	813,955	Feb. 27	4852	1072	120	2686
Deane, Herbert C., Salt Lake City, Utah. Skirt-supporter	810,729	Jan. 23	4314	896	120	1064
Decker, Earle H., Keokuk, Iowa, assignor of one-half to G. J. Stiteley, Joliet, Ill. Base-ball glove	812,921	Feb. 20	2791	614	120	2183
Decker, Phillip J., San Francisco, Cal. Rotary engine	811,204	Jan. 30	5278	1104–5	120	1306
Decker, William H. (See Warden, Manns, and Decker.)						
Decker, William W. K., *et al.* (See Driver, Charles H., assignor.)						
Defenbaugh, Andrew, Laureiville, Ohio. Vehicle-wrench	811,549	Feb. 6	24	6	120	1490
Degen, Julius. (See Lea and Degen.)						
Degenhardt, Johannes, Berlin, Germany, assignor to W. F. Plass, New York, N. Y. Skylight. (Reissue)	12,432	Jan. 2	1339	272	120	295
Dehn, Frederick D., *et al.* (See Barry, Jefferson D., assignor.)						
Deiller, Martin, Newark, N. J. Tobacco-stripper	813,868	Feb. 27	4693	1037–9	120	2654
Deiller, Martin, Newark, N. J. Shaft-clutch	813,869	Feb. 27	4697	1039	120	2654
Deister, Emil, Fort Wayne, Ind. Ore-concentrator	810,847	Jan. 23	4530	943	120	1110
Del Mar, Harry, New York, N. Y. Mailing-tube sheet and wrapper	812,187	Feb. 13	1369	298	120	1838
Delano, Frederic A., Chicago, Ill. Box-car	810,472	Jan. 23	3829	786	120	957
Delany, Patrick B., South Orange, N. J. Wireless telegraphy	808,641	Jan. 2	40	9	120	11
Delany, Patrick B., South Orange, N. J. Telegraphic keyboard apparatus	808,642	Jan. 2	43	9	120	12
Delhaye, Hubert F. (See Robichaux, Caillouet, and Delhaye.)						
Delisle, Napoleon, St. Tite, Canada. Wrench	812,551	Feb. 13	2097	460	120	1994
Delk, John T., Ivor, Va. Peanut-thresher	809,097	Jan. 2	957	199	120	212
Demarest, David C., Angels Camp, Cal. Rock-drill	813,041	Feb. 20	3031	667	120	2236
Dement, Isaac S., East Orange, N. J., and F. J. Hull, Brooklyn, N. Y., assignors, by mesne assignments, to City Trust Company of New York, trustee. Keyboard-locking mechanism for mechanical cashiers, registers, and recorders	813,360	Feb. 20	3674	805–6	120	2373
Dement, Wallace E., Blaine, Wash. Cattle-guard	812,984	Feb. 20	2926	644	120	2213
Demsky, Enoch, St. Louis, Mo. Vehicle-body construction	813,056	Feb. 27	4355	1072	120	2687
Denegre, Edward, Chicago, Ill. Dust-guard	810,039	Jan. 16	2879	594–5	120	716
Denegre, Edward, assignor to McCord & Company, Chicago, Ill. Dust-guard	810,038	Jan. 16	2877	594	120	716
Denis, Jules E. G., and L. M. J. de Boisse, Paris, France. Driving-axle for automobile vehicles	812,118	Feb. 6	1160	255	120	1724
Denison, Linus S. (See Shatto and Denison.)						
Denmead, John W., Akron, assignor to E. C. Prince and C. C. Patterson, Barberton, Ohio. Water-heater	811,388	Jan. 30	5623	1177	120	1381
Dennett, Charles. (See Wyman, Dennett, and Tinkham.)						
Denning, Patrick F., Newark, N. J. Clamp	808,731	Jan. 2	222	47	120	51
Dennis, Adolphus S., Cleveland, Ohio. Adding and recording machine	813,361	Feb. 20	3677	806–8	120	2373
Dennis, Harry H., Lunda, Ohio. Shield attachment for cultivators	810,628	Jan. 23	4140	855	120	1025
Denphis, Peter, Michigamme, Mich. Pressure and moving jack	811,131	Jan. 30	5129	1071	120	1272
Densmoor, Frank, Markesan, Wis. Rotary cutter and topper	810,397	Jan. 23	3676	757	120	921
Denson, Arthur B., Beloit, Wis. Sandpapering-machine	812,119	Feb. 6	1162	256	120	1725
Dent, Joshua H. (See Hatfield, James I., assignor.)						
Denton, Gilbert E., Denver, Colo. Landing-chair for mining-cages	809,176	Jan. 2	1087	226–7	120	239
Denver Tent and Awning Company. (See Roth, Charles C., assignor.)						
Deppe, Nelson R., Deppe, N. C. Kiln-door	812,728	Feb. 13	2423	531	120	2057
Derby, Harold R., assignor to S. L. Hill, Jerseyville, Ill. Spring-roller for window-shades	809,008	Jan. 2	962	199	120	213
Derby, John H., Brookline, Mass. Automatic valve for fire-extinguishers	810,040	Jan. 16	2880	595	120	716
Déri, Max, Vienna, Austria-Hungary, assignor to Stanley Electric Manufacturing Company, Pittsfield, Mass. Alternating-current motor	809,787	Jan. 9	2367	488	120	553
Desrumaux, Henri, Paris, France. Filtering, purifying, and decanting apparatus	809,099	Jan. 2	963	200	120	213
Detmer, Henry. (See Kolby, Nicolaus, assignor.)						
Deutsch, Ludwig. (See Schlatter and Deutsch.)						
Devan, Andrew, Missoula, Mont. Cattle-guard	810,328	Jan. 16	3483	720	120	843
Devin, Lee A., and F. S. Atkins, Oakland, Cal. Car fender and brake	812,022	Feb. 6	997	218	120	1691
Devis, Charles. (See Shafer and Devis.)						
Dewes, Abednego, New York, N. Y. Tire for vehicle-wheels	810,921	Jan. 30	4721	985	120	1185
Dewing, Fred M. (See Gale and Dewing.)						
Dexter, Himan C. (See Dexter, Marshall C., assignor.)						
Dexter, Marshall C., assignor to H. C. Dexter, New York, N. Y. Safety-pocket	813,362	Feb. 20	3682	809	120	2374
Dial, Grant D., Chicago, Ill. Display-hanger	809,359	Jan. 9	1507	305	120	367
Dial Voting Machine Company. (See Harrington, Charles F., assignor.)						
Dial, Wilbur F. (See Dimond and Dial.)						
Diamond Iron Works. (See Dittbenner, Hermann G., assignor.)						
Diamond Match Company. (See Prindle, Edwin J., assignor.)						
Diamond Match Company. (See Wright, Jacob P., assignor.)						
Dibie, Napoleon W., Kansas City, Mo. Apparatus for promoting the growth of hair	809,360	Jan. 9	1508	305	120	367
Dick, Albert B., Lake Forest, assignor to A. B. Dick Company, Chicago, Ill. Duplicating apparatus	809,287	Jan. 9	1362	277	120	335
Dick, Albert B., Lake Forest, assignor to A. B. Dick Company, Chicago, Ill. Duplicating apparatus	809,288	Jan. 9	1365	277	120	335
Dick, Willis V., Columbus, Ohio. Fire-resisting cabinet	809,497	Jan. 9	1807	372	120	431
Dickerman, Oscar C., Gainesville, Tex. Whiffletree connection	812,188	Feb. 13	1370	298	120	1838
Dickerson, Roy E., Boukler Creek, Cal. Educational device for teaching spherics	812,408	Feb. 13	1806	395	120	1923
Dickey, Eliza R., Dugger, Ind. Coal-screen	810,922	Jan. 30	4722	986	120	1186
Dickinson, Edward C., Elgin, Ill. Lamp-guard	810,266	Jan. 16	3356	695	120	815
Dickinson, Harry E. (See Mitchell and Millingar, assignors.)						
Dickinson, Joseph H. (See Miller and Dickinson.)						
Dickson, Frederick L., El Paso, Tex. Fishing-reel	812,023	Feb. 6	999	218	120	1691
Dickson, George F., Chicago, Ill., assignor to Confectioners and Bakers Supply Co. Confectioner's sizing and cutting machine	809,498	Jan. 9	1809	373	120	432
Diederichs, Louis. (See Voland, Diederichs, and Monnet.)						
Diedendorf, Abram. (See Seller, Philipp, assignor.)						
Diehl, Jacob, assignor to Standard Sewing Machine Company, Cleveland, Ohio. Sewing and cutting machine	812,409	Feb. 13	1809	396	120	1934

E. I. Du Pont de Nemours Powder Company. (See Sparre, Fin, assignor.)						
E. W. Bliss Company. (See Beyer, Otto S., assignor.)						
E. W. Bliss Company. (See Lindgren, Bror J., assignor.)						
Eaches, William R., Reading, assignor to J. T. Williams, Easton, Pa. Annealing metal	808,911	Jan. 2	577	.....	120	126
Eade, William J., Dayton, Ohio. Fence-post	813,782	Feb. 27	4513	996	120	2615
Eagle Pencil Company. (See McIntyre, Frank, assignor.)						
Eakins, Herbert W., assignor to W. Z. Long, Springfield, Ohio. Corn-popper	808,734	Jan. 2	227	48-9	120	52
Eames, George M., and J. S. Finch, assignors to Wheeler & Wilson Manufacturing Company. Bridgeport, Conn. Sewing-machine bobbin-winder	809,911	Jan. 9	2594	534	120	603
Earle, Swepson, Washington, D. C. Sounding device	811,207	Jan. 30	5285	1106	120	1307
Eastman, George N., assignor to Minerallac Company, Chicago, Ill. Voltmeter-switch	810,522	Jan. 23	3933	809	120	980
Eastwood, Arthur C., Cleveland, Ohio. Operating electric motors	810,269	Jan. 16	3361	696	120	817
Eaton, Carp D., Allen, Mich. Watch-pendant attachment	811,705	Feb. 6	328	72	120	1558
Eaves, Charles M., J. W. Slaven, and O. W. Wade, Galesburg, Ill. Street-sweeper	813,544	Feb. 27	4054	888-9	120	2517
Eberlein, August, Bridgeport, Conn. Device for reseating valves and faucets	808,912	Jan. 2	578	128	120	127
Ebken, John G., Pittsburg, Pa. Vehicle-brake	813,545	Feb. 27	4057	889	120	2518
Eby, Maurice S., New Orleans, assignor of one-half to A. H. Thompson, Patterson, La. Dog for sawmill-carriages	813,143	Feb. 20	3257	716	120	2286
Eck, Charles A., Newark, N. J. Motor control	813,410	Feb. 27	3782	830	120	2454
Eckersley, Frank, Crofton, near Wakefield, England. Feed for coal-cutting machines	809,790	Jan. 9	2371	489-90	120	554
Eckler, George E., Akron, Ohio. Rotary engine	813,284	Feb. 20	3515	775	120	2340
Eckley, Matthew, Archbold, Ohio. Cement-block machine	808,643	Jan. 2	45	10	120	12
Economy Cement Post Machine Company. (See Terry, George H., assignor.)						
Edbrooke, Harry W. J., and F. Lindquist, Chicago, Ill. Window-sash	809,609	Jan. 9	2032	421	120	478
Edenfield, Dempsey S., assignor of one-half to J. L. Hiers, Savannah, Ga. Hay-baling press	812,332	Feb. 13	1658	364-5	120	1903
Edge, Evander, Ruskin, N. C. Haulage system	810,731	Jan 23	4317	897	120	1065
Edgerle, Harrison H., Cherryvale, Kans. Nut-lock	810,523	Jan. 23	3936	809	120	981
Edison Storage Battery Company. (See Edison, Thomas A., assignor.)						
Edison, Thomas A., Llewellyn Park, N. J. Cement-kiln	813,490	Feb. 27	3946	865	120	2493
Edison, Thomas A., Llewellyn Park, assignor to Edison Storage Battery Company, West Orange, N. J. Pocket-filling machine	813,491	Feb. 27	3947	866-7	120	2493
Edmonds, Herbert H., Longueville, near Sydney, New South Wales, Australia. Instrument for graphically solving spherical triangles on a plane surface	811,625	Feb. 6	182	41	120	1526
Edmunds, James E., *et al.* (See Birmingham, John P., assignor.)						
Edstrom, Axel W., Stanton, Iowa. Sieve	812,333	Feb. 13	1660	365	120	1903
Edward E. Rieck Company. (See Glanzer, John J., assignor.)						
Edward F. Luce & Company. (See Luce, Edward F., assignor.)						
Edward Miller & Company. (See Homan and Williams, assignors.)						
Edwards, Charles D., Albert Lea, Minn. Road grader and ditcher	810,477	Jan. 23	3838	788-9	120	959
Edwards, Charles D., Albert Lea, Minn. Landside-wheel	810,478	Jan. 23	3841	789	120	959
Edwards, Edgar A., Cincinnati, Ohio, assignor, by mesne assignments, to Metropolitan Trust & Savings Bank, trustee. Locomotive-headlight	812,192	Feb. 13	1376	299	120	1820
Edwards, John J., Ann Arbor, Mich. Temporary binder	812,121	Feb. 6	1165	256	120	1725
Edwards, Marshall F., Stillwater, Okla. Ter. Hub-wrench	812,334	Feb. 13	1661	365	120	1904
Edwin J. Toof Company. (See Ammerman, William M., assignor.)						
Egersdörfer, Fritz, Wiesbaden, assignor of one-half to F. Linder, Sr., Barmen, Germany. Rotary engine	812,414	Feb. 13	1818	398	120	1936
Egge, Nils N., Joice, Iowa. Draft-equalizer	808,823	Jan. 2	396	86	120	88
Egger, Fritz, Solothurn, Switzerland. Nailless horseshoe	810,949	Jan. 23	4535	944	120	1112
Eggers, Frederick, Cincinnati, Ohio. Ore-washing plant	810,166	Jan. 16	3197	662	120	782
Ehle, Archibald H., and J. H. Nice, assignors to Burnham, Williams & Company, Philadelphia, Pa. Clutch	813,369	Feb. 20	3695	812	120	2377
Ehmann, Charles P., Manchester, England. Antivibrator burner for incandescent gas-lights	812,167	Feb. 6	1298	263	120	1753
Ehringer, Charles G. (See Butler and Ehringer.)						
Eichengrün, Arthur, Elberfeld, Germany, assignor to Farbenfabriken of Elberfeld Co., New York, N. Y. Flash-light composition	812,028	Feb. 6	1007	.....	120	1693
Eichengrün, Arthur, and T. Becker, Elberfeld, Germany, assignors to Farbenfabriken of Elberfeld Co., New York, N. Y. Cellulose acetate	809,935	Jan. 16	2660	.....	120	667
Eichhorn, Johann, Nuremberg, Germany, assignor to Eugene Dietzgen Co., New York, N. Y. Adjusting mechanism for saw-threaded needle-point insertions of compasses	808,644	Jan. 2	47	10	120	12
Eisk, Otto, Baltimore, Md. Bottle-holding rack	808,824	Jan. 2	397	86	120	88
Eigen, Benno vom, assignor to A. Goertz & Co., Newark, N. J. Bag-frame	810,926	Jan. 30	4725	987	120	1186
Eigen, Benno vom, Newark, N. J., assignor to A. Goertz & Co. Handle or strap attachment for bag-frames	810,928	Jan. 30	4728	987	120	1186
Eikler, Fred. (See Lemley, Elkior, and Grant.)						
Eichholz, Emil, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company. Metal axle	808,736	Jan. 2	230	49-50	120	53

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drf's.	Official Gazette. Vol.	Official Gazette. Page.
Einfeldt, Emil, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company. Shaping metal bars	808,736	Jan. 2	231	80	120	53
Einfeldt, Emil, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company. Machine for making metal wheels	810,197	Jan. 16	3199	663-4	120	782
Einfeldt, Emil, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company. Making metal wheels	810,198	Jan. 16	3208	665	120	784
Einfeldt, Emil, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company. Wagon-gear	813,285	Feb. 20	3519	776	120	2340
Einfeldt, Emil, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company. Wagon-gear	813,286	Feb. 20	3521	776	120	2341
Einhorn, Alfred, Munich, assignor to Farbwerke vorm. Meister, Lucius & Brüning, Höchst-on-the-Main, Germany. Alkamin esters of para-aminobenzoic acid	812,554	Feb. 13	2100	.....	120	1904
Eiselt, Victor, Muggia, near Triest, Austria-Hungary. Screw-wrench	810,850	Jan. 23	4536	944	120	1112
Eisenhart, Henry W., assignor to A. B. Farquhar Company, Limited, York, Pa. Grain threshing and separating machine	813,967	Feb. 27	4856	1072-4	120	2687
Eisenhuth Horseless Vehicle Co. (See Eisenhuth, John W., assignor.)						
Eisenhuth Horseless Vehicle Company. (See Graham and Fox, assignors.)						
Eisenhuth, John W., Brooklyn, N. Y., assignor to Eisenhuth Horseless Vehicle Co. Compound gas-engine	809,791	Jan. 9	2372	490	120	554
Eklund, Idoff. (See Backlin and Eklund.)						
Eklund, John, St. Joseph, Mich., and E. L. Walker, St. Louis, Mo. Machine for use in making baskets or other receptacles	810,270	Jan. 16	3363	696-7	120	817
Ekroos, Sigurd W., New York, N. Y. Safety gas-burner	808,825	Jan. 2	398	87	120	89
Elder, James M., Indianapolis, Ind. Pneumatic tire	811,490	Jan. 30	5798	1213	120	1416
Eldred, Byron E., Bronxville, assignor to Combustion Utilities Company, New York, N. Y. Burning ceramic ware	810,044	Jan. 16	2889	596	120	718
Eldred, Byron E., Bronxville, assignor to Combustion Utilities Company, New York, N. Y. Steam-boiler furnace	811,626	Feb. 6	191	41	120	1526
Eldred, Byron E., Bronxville, assignor to Combustion Utilities Company, New York, N. Y. Blast combustion	812,193	Feb. 13	1376	299	120	1840
Eldred, Byron E., Bronxville, assignor to Combustion Utilities Company, New York, N. Y. Oscillating cement-kiln	812,834	Feb. 20	2632	575	120	2148
Eldred, Byron E., Bronxville, assignor to Combustion Utilities Company, New York, N. Y. Operating gas-producers	813,628	Feb. 27	4217	927	120	2551
Eldred, Byron E., Brookline, Mass., assignor to Combustion Utilities Company, New York, N. Y. Cement-burning process and apparatus therefor	813,627	Feb. 27	4215	927	120	2551
Eldred, Byron E., and C. Ellis, assignors to Combustion Utilities Company, New York, N. Y. Apparatus for generating gas	811,706	Feb. 6	329	72	120	1559
Eldridge, Edward L., Cazenovia, N. Y. Door check and closer	813,693	Feb. 27	4389	955	120	2577
Electric Amusement Company. (See Gaynor, Thomas F., assignor.)						
Electric Boat Company. (See Spear, Lawrence Y., assignor.)						
Electric Controller & Supply Company. (See Gilpin, Charles D., assignor.)						
Electric Gas Lighting Company. (See Boardman, Arthur F., assignor.)						
Elevator Securities Company. (See Hiss and De Buren, assignors.)						
Elevator Securities Company. (See MacKaye, Harold S., assignor.)						
Elicker, Charles A. (See Lease, Lyman G., assignor.)						
Elkins, John P. (See Myers, McClelland, assignor.)						
Ellés, Edouard. (See Kraemer and Ellés.)						
Elliff, Josiah C., Willis Point, Tex. Mail-bag catcher	812,835	Feb. 20	2635	576	120	2149
Elliot Frog & Switch Company. (See Elliot, William H., assignor.)						
Elliot Frog & Switch Company. (See Elliot and Townsend, assignors.)						
Elliot Frog & Switch Company. (See Scott, William H., assignor.)						
Elliot, William H., St. Louis, Mo., assignor to Elliot Frog & Switch Company, East St. Louis, Ill. Adjustable switch-rod	813,873	Feb. 27	4701	1040	120	2656
Elliot, William H., St. Louis, Mo., and J. J. Townsend, assignors to Elliot Frog & Switch Company, East St. Louis, Ill. Wear-plate for railway-switches	813,874	Feb. 27	4702	1041	120	2656
Elliott, Lewis P., Jackson Center, Ohio. Car-coupling	810,400	Jan. 23	3679	758	120	921
Ellis, Carleton. (See Bridge and Ellis.)						
Ellis, Carleton. (See Eldred and Ellis.)						
Ellis, Carleton, Roslindale, Mass., assignor to Chadeloid Chemical Company, New York, N. Y. Paint and varnish remover	811,044	Jan. 30	4951	.....	120	1237
Ellis, Carleton, assignor to Combustion Utilities Company, New York, N. Y. Gas-producer	811,208	Jan. 30	5287	1106	120	1307
Ellis, Carleton, assignor to Combustion Utilities Company, New York, N. Y. Power-gas producing and consuming apparatus	812,194	Feb. 13	1379	300	120	1840
Ellis, Carleton, assignor to Combustion Utilities Company, New York, N. Y. Heat-recuperator for cement-kilns	812,786	Feb. 13	2528	555	120	2080
Ellis, Carleton, assignor to Combustion Utilities Company, New York, N. Y. Gas-producer	813,629	Feb. 27	4219	927	120	2552
Ellis, Carleton, assignor to Combustion Utilities Company, New York, N. Y. Heat-regenerator for cement-kilns	813,630	Feb. 27	4223	928	120	2553
Ellis, Carleton, assignor to Combustion Utilities Company, New York, N. Y. Generating gas	814,001	Feb. 27	4949	1094	120	2705
Ellis, John F., Torrington, Conn., assignor to Coe Brass Manufacturing Company. Cylinder for treating heated metal	811,707	Feb. 6	331	73	120	1559
Elrich, Robert C., assignor to Peck, Stow & Wilcox Company, Southington, Conn. Bit-brace jaw	809,936	Jan. 16	2651	543	120	668
Elmberg, Ernest F., Chicago, Ill. Attachment for type-writing machines	810,595	Jan. 23	4046	969	120	1124
Elmquist, Victor, Chicago, Ill. Door for grain-cars	813,831	Feb. 27	4725	928-9	120	2553
Elwell, Braden L., and W. Grimm, assignors to Interlocking Fence Company, Morton, Ill. Wire fence	813,370	Feb. 20	3697	812	120	2378
Emerson, Frederic M., Brookline, Mass. Concrete-mold	811,135	Jan. 30	5137	1073	120	1274
Emerson, George W., Denison, Tex. Skiving-machine	813,958	Feb. 27	4960	1075	120	2688
Emery, Albert H., Stamford, Conn. Cartridge	811,910	Feb. 6	722	157-8	120	1637
Emett, Arthur, Ealing, England. Frame and board for displaying advertising bills, pictures, &c.	812,415	Feb. 13	1819	398	120	1936
Emmerich, Rudolph F. (See Spaulding, Elijah F., assignor.)						
Emmert, George C., Mount Morris, Ill. Sliding-door latch and lock	810,927	Jan. 30	4731	987-8	120	1186
Emmet, William L. R., Schenectady, N. Y., assignor to General Electric Company. Packing for elastic-fluid turbines	811,833	Feb. 6	554	122-3	120	1603
Emmons, Fannie B., Richmond, Ind. Hair-drier	808,645	Jan. 2	46	10	120	13
Emmons Loom Harness Company. (See Wingate, Wilbur E., assignor.)						
Empire Electric Steam Lighting Company. (See George, Joseph F., assignor.)						
Empire Jewelry Case Company. (See Bergod, Julius, assignor.)						
Emry, Robert H., Batavia, Iowa. Garment-supporter	811,553	Feb. 6	29	7	120	1491
Engberg, Ephraim O., Salt Lake City, Utah, assignor to J. B. Patton, Kent, Ohio. Machine for trimming and applying shade goods. (Reissue)	12,445	Feb. 6	1311	386-7	120	1757

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drf'g.	Official Gazette. Vol.	Official Gazette. Page.
Engelberg Huller Company. (See Halstead, Willard, assignor.)						
Engelmann, Max, Elberfeld, Germany, assignor to Farbenfabriken of Elberfeld Co., New York, N. Y. Making dialkyl-barbituric acids	809,362	Jan. 9	1515	.....	120	368
Engle, Wilber D. (See Haynes and Engle.)						
Englemier, Charles W., assignor of one-half to A. E. Fink, Newark, N. J. Stair-tread	811,834	Feb. 6	556	128	120	1603
English, Frank, New Philadelphia, and A. G. Quimby, Uhrichsville, Ohio. Railway	810,479	Jan. 23	3641	789	120	980
Englund, Albert O., Wayne, Kans. Rotary engine	809,363	Jan. 9	1516	307–8	120	368
Englund, Ernst E., assignor to D. M. Sechler Carriage Company, Moline, Ill. Corn-planter	811,554	Feb. 6	30	7–8	120	1491
Enos, Silvanus F., Mattoon, Ill. Game	810,631	Jan. 23	4144	856	120	1026
Ensign, Emory S., Cambridgeport, assignor to Ensign Manufacturing Company, Boston, Mass. Calculating-machine	809,047	Jan. 2	336	178–9	120	185
Ensign Manufacturing Company. (See Ensign, Emory S., assignor.)						
Enterprise Railway Equipment Company. (See Campbell, Argyle, assignor.)						
Epley, John A., Iuka, Kans. Spool-cabinet	809,274	Jan. 2	1329	270	120	293
Epperson, Henry T., San Francisco, Cal., assignor of one-half to G. W. Clarke, East Liverpool, Ohio. Kiln	812,029	Feb. 6	1008	220	120	1693
Eppinger, William, New York, N. Y. Apparatus for smoking and curing meat products	812,922	Feb. 20	2703	615	120	2184
Erard, Oral P., Toledo, Ohio. Front bolster and body-support for children's wagons	808,977	Jan. 2	715	154	120	188
Erath, Jean, Strassburg, Germany. Floor structure	811,491	Jan. 30	5709	1214	120	1416
Erdmenger, Victor, assignor to F. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Starting device for explosion-engines	813,959	Feb. 27	4862	1075–6	120	2668
Erickson, Gustaf A., R., and H., Fort Dodge, Iowa. Feed-water heater	810,732	Jan. 23	4319	897	120	1065
Erickson, Hildor. (See Erickson, Gustaf A., R., and H.)						
Erickson, Robert. (See Erickson, Gustaf A., R., and H.)						
Ericson, Job E., San Francisco, Cal. Flushing-tank valve	812,030	Feb. 6	1009	220	120	1694
Ericson, John V. (See Ericson, Richard W. and J. V.)						
Ericson, Richard W. and J. V., Chicago, Ill. Dumping-car	810,524	Jan. 23	3936	810	120	981
Erikson, Erik, assignor of one-half to O. E. Huglin, Odebolt, Iowa. Floor-scraper	811,282	Jan. 30	5430	1132	120	1239
Ernst, John H., assignor to Silver & Company, Brooklyn, N. Y. Alcohol-burner	813,763	Feb. 27	4515	997	120	2615
Erret, Joseph, Cleveland, Ohio. Vehicle-step	810,199	Jan. 16	3211	665	120	784
Ersahan, Nicholas, Elkton, S. D. Railway-signal	812,555	Feb. 13	2101	461	120	1994
Erskine, William B., Madison Mills, Ohio. Crane	809,674	Jan. 9	2163	447	120	507
Escales, Richard, Munich-Schwabing, Germany. Explosive compound	812,196	Feb. 13	1382	.....	120	1841
Eten, William B. (See Worth and Eten.)						
Etheridge, Carroll L. (See Heinrich, Schmidt, and Etheridge.)						
Ettenger, Robert L., Washington, D. C., assignor, by mesne assignments, to Damascus Brake Beam Company, Cleveland, Ohio. Adjustable head for brake-beams	813,960	Feb. 27	4864	1076	120	2668
Ettinger, Samuel F., Little Rock, Ark. Non-refillable bottle	813,961	Feb. 27	4866	1076	120	2669
Etsenhouser, Elias, and R. L. Morss, San Jose, Cal. Window-lock	810,045	Jan. 16	2892	566	120	719
Eugene Dietzgen Co. (See Eichmüller, Johann, assignor.)						
Eustis, John P., Newton, Mass. Pipe-coupling	809,792	Jan. 9	2375	490	120	555
Evans, Charles M., Carmichaels, Pa. Sash-lock	810,110	Jan. 16	3025	629	120	751
Evans, David C., and O. Q. Patterson, Uniontown, Pa. Street-car indicator	813,144	Feb. 20	3258	716–17	120	2286
Evans, George W. Tuxedo Park, Md. Ventilator for sewer and other pipes	810,733	Jan. 23	4320	898	120	1066
Evans, Harry. (See Weisnak, Ignatz, assignor.)						
Evans, Lewis J., Riverside, assignor of five-eighths to C. Tyler and J. M. Davidge, Binghamton, N. Y. Mail-bag catcher	808,646	Jan. 2	80	10–11	120	13
Eveland, Samuel S., Philadelphia, Pa. Lifting-jack	811,136	Jan. 30	5139	1074	120	1275
Eveland, Samuel S., Philadelphia, Pa. Electric riveter	811,137	Jan. 30	5140	1074	120	1275
Eveland, Samuel S., Philadelphia, Pa. Ball-bearing	811,708	Feb. 6	333	73	120	1560
Eveleth, Clarence M., Plymouth, N. H. Weather-strip	812,411	Feb. 27	3784	830–1	120	2454
Evershed, Sydney, Streatley, assignor to himself, and Evershed and Vignoles, Limited, Chiswick, England. Apparatus for measuring electric resistances	810,320	Jan. 16	3488	720–1	120	844
Evershed, Sydney, Streatley, assignor to himself, and Evershed and Vignoles, Limited, Chiswick, England. Apparatus for measuring electric resistances	812,196	Feb. 13	1382	300–1	120	1841
Evershed and Vignoles. (See Evershed, Sydney, assignor.)						
Ewing, Aurelius M., Seattle, Wash. Rail-joint chair	809,434	Jan. 9	1684	346	120	402
F. F. Slocomb & Co. (See Fle, Eugene F., assignor.)						
Faas, Martin, New York, N. Y. Attachment for reclining-chairs	811,138	Jan. 30	5141	1074	120	1275
Fagan, Bernard J., New York, N. Y. Theatrical appliance	810,734	Jan. 23	4321	898	120	1066
Faherty, John P., and J. H. M. Blackford, Duquesne, Pa. Boiler attachment	810,532	Jan. 23	4145	856	120	1026
Fahl, Eugene, St. Louis, Mo. Game apparatus. (Reissue)	12,461	Feb. 27	4068	1100	120	2709
Fair, Milton Q., Sr., Chicago, Ill. Cot for invalids	811,492	Jan. 30	5800	1214	120	1416
Fairbanks, James G., and G. L. Sauer, Marion, Ohio. Jack for steam-dredges, &c	811,709	Feb. 6	334	73	120	1560
Fairbanks, Morse & Company. (See Hobart, Franklin G., assignor.)						
Fairbanks, Morse & Company. (See Johnson, Wallace B., assignor.)						
Fairbrother, Henry, London, England. Handle or grip of dumb-bells or other exercising apparatus	808,737	Jan. 2	233	50	120	53
Fairchild, Frank J., Detroit, assignor to Automatic Car Fender Co., Wyandotte, Mich. Car-fender	813,632	Feb. 27	4227	929	120	2554
Fairless, James D., Iuka, Miss. Cotton-scraper	813,085	Feb. 20	3124	695	120	2257
Falk, George, and W. H. Parker, Cardiff, Ill. Safety-hook	810,928	Jan. 30	4737	966	120	1189
Falls, Charles H., Clarksville, Iowa. Bridle-bit	809,264	Jan. 9	1524	309	120	370
Falt, Fred A., West Medford, Mass. Pipe-cleaner	808,836	Jan. 2	400	87	120	89
Fancher, Charles J., West Granby, Conn., assignor to Simplex Manufacturing Company, New York, N. Y. Safety-valve	813,145	Feb. 20	3261	717	120	2287
Fancher, Charles J., and H. S. Parmelee, West Granby, assignors to Simplex Manufacturing Company, Hartford, Conn. Envelop-sealing machine	812,963	Feb. 13	1534	332–3	120	1872
Fanning, Frederick F. (See Mumford, John F., assignor.)						
Fantom, Chester W., Wellsville, N. Y., assignor to Oil Well Supply Company, Pittsburg, Pa. Tempering-screw	812,487	Feb. 13	1949	430	120	1963
Farbenfabriken of Elberfeld Co. (See Eichengrün, Arthur, assignor.)						
Farbenfabriken of Elberfeld Co. (See Eichengrün and Becker, assignors.)						
Farbenfabriken of Elberfeld Co. (See Engelmann, Max, assignor.)						
Farbenfabriken of Elberfeld Co. (See Heilmann, Fritz, assignor.)						
Farbenfabriken of Elberfeld Co. (See Kugel, Max, assignor.)						
Farbenfabriken of Elberfeld Co. (See Schmidt, Robert E., assignor.)						
Farbenfabriken of Elberfeld Co. (See Schmidt and Thun, assignors.)						
Farbwerke vorm. Meister, Lucius & Brüning. (See Ehrhorn, Alfred, assignor.)						
Farbwerke vorm. Meister, Lucius & Brüning. (See Schmidt and Kruchoh, assignors.)						
Farmer, George M., Rossland, assignor to C. E. Heard, Victoria, British Columbia, Canada. Valve	812,021	Feb. 6	1011	221	120	1694
Farmer, Edwin T., assignor of one-half to J. Rubi, Carthage, Mo. Flour-sifter	809,178	Jan. 2	1082	227	120	240
Farmer, Henry, Brooklyn, N. Y. Inverted incandescent gas-burner	812,042	Feb. 20	2683	695	120	2286
Farquhar Company, A. B. (See Eisenhart, Henry W., assignor.)						
Farrand, Hiram A., New York, N. Y. Camera	813,669	Feb. 27	4229	929–30	120	2554

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drf'g.	Official Gazette. Vol.	Official Gazette. Page.
Farrell, John H., Chicago, Ill. Knockdown support	811,209	Jan. 30	5288	1106	120	1308
Farrell, Philip H., Flushing, N. Y. Dop	812,836	Feb. 20	2636	576	120	2149
Fassett, Riley D., assignor of one-half to W. H. Ned, Denver, Colo. Grinding-machine	812,122	Feb. 6	1168	256–7	120	1726
Faulk, James M., assignor of two-sixths to W. Frazee, St. John, Kans., and D. J. Smith, Curevo, N. Mex. Ter. Automatic railway-switch	808,827	Jan. 2	401	87–8	120	89
Faulkner, Charles H., Somerville, assignor to Champion Metal Weather Strip and Parting Bead Company, Boston, Mass. Window attachment	810,735	Jan. 23	4322	898	120	1066
Faut, Delbert A., Chicago, Ill. Car-step	811,911	Feb. 6	726	158–9	120	1639
Featherstone Foundry and Machine Company. (See Niles, Francis H., assignor.)						
Febles, Ramon, Harrisburg, Pa. Tool	813,412	Feb. 27	3786	831	120	2455
Feckse, Gottlieb L. (See Swasey and Feckse.)						
Fedden, John H., New York, N. Y., assignor of one-half to T. A. O'Callaghan, Hoboken, N. J. Stocking	812,168	Feb. 6	1299	284	120	1754
Feder, Harry, New York, N. Y. Waterproofing twine	812,837	Feb. 20	2637	.....	120	2149
Fedick, Edward A. (See Johengen and Fedick.)						
Felicke, Adolf, Charlottenburg, Germany. Watch	809,200	Jan. 9	1368	278	120	336
Feist, Theodore. (See Cramer, John, assignor.)						
Feland, Joseph E., *et al.* (See Swallow, Fredric, assignor.)						
Felbel, Jacob, New York, N. Y., assignor to Union Typewriter Company, Jersey City, N. J. Type-writing machine	809,675	Jan. 9	2164	447	120	507
Fellenberg, Wilhelm, Charlottenburg, Germany. Inclosed safety device for fuses for electrical installations	813,546	Feb. 27	4057	889	120	2518
Fellows Olin S., and A. E. Hopkins, Middletown, N. Y. Apparatus for removing superfluous metallic coating from sheet metal	810,851	Jan. 23	4537	944–5	120	1112
Felt, A. C., *et al.* (See Dysart, Fred B., assignor.)						
Feltmann, Adam W., Chicago, Ill. Dental tool	809,365	Jan. 9	1525	309	120	370
Felton, Samuel M. (See Mansfield and Felton.)						
Fenn, Prosper D., Chicago, Ill. Stereoscope	810,401	Jan. 23	3681	758	120	922
Fenn, William B., Sheepshead Bay, N. Y. Closure device for glass jars and other vessels	810,736	Jan. 23	4323	898	120	1066
Fenn, William B., Sheepshead Bay, N. Y. Metallic can	810,737	Jan. 23	4324	899	120	1067
Fennell, William, and W. P. Perry, Leytonstone, England. Storage battery	810,929	Jan. 30	4739	966	120	1189
Fennell, William, and W. P. Perry, Leytonstone, England. Storage battery	810,930	Jan. 30	4739	969	120	1190
Fensky, Charles, St. Louis, Mo. Non-refillable bottle	813,547	Feb. 27	4059	889	120	2518
Ferguson, James, assignor to Kelvin & James White, Limited, Glasgow, Scotland. Electrostatic voltmeter	809,703	Jan. 9	2376	491	120	555
Ferguson, James J., and S. P. Oswald, Nashville, Tenn. Sack-filling machine	812,335	Feb. 13	1662	365–6	120	1904
Ferguson, John A., Denver, Colo. Press for concrete building-blocks	812,416	Feb. 13	1820	398–9	120	1936
Ferguson, Samuel B., and C. Calhoun, Rome, Miss. Rail-tie	810,633	Jan. 23	4146	857	120	1026
Ferris, Henry L., assignor to Hunt, Helm, Ferris & Company, Harvard, Ill. Wagon	809,912	Jan. 9	2597	534–5	120	604
Ferris, Henry L., assignor to Hunt, Helm, Ferris & Company, Harvard, Ill. Wagon	809,913	Jan. 9	2599	535	120	605
Ferris, Walter. (See Knox and Ferris.)						
Ferris, Walter, assignor to Bucyrus Company, South Milwaukee, Wis. Railway-car truck	809,435	Jan. 9	1685	346–7	120	402
Ferris, Walter, assignor to Bucyrus Company, South Milwaukee, Wis. Dipper for dredges, excavators, and the like	809,436	Jan. 9	1686	347	120	403
Ferris, Walter, assignor to Bucyrus Company, South Milwaukee, Wis. Composite boom for steam-shovels and the like	812,264	Feb. 13	1531	334	120	1874
Ferry, Arthur C., Chicopee Falls, Mass. Ball-player's mitt	811,389	Jan. 30	5624	1178	120	1381
Ferry, James F., Leadville, Colo. Cooking utensil. (Reissue)	12,452	Feb. 13	2560	563	120	2087
Fertig, Lewis P., Chicago, Ill. Combined car axle and wheel structure	810,525	Jan. 23	3938	810	120	981
Fesler, Stephen A., Cupertino, Cal. Pipe-wrench	810,738	Jan. 23	4326	899	120	1067
Fetters, Arthur H. (See McKeen and Fetters.)						
Fetzer, Louis W. (See Kraft and Fetzer.)						
Fetzer, William, Middletown, Ohio. Transplanter	812,556	Feb. 13	2103	461	120	1995
Feucht, John, Brainerd, Minn. Grain-door for cars	812,838	Feb. 20	2638	576–7	120	2149
Feucht, John, Brainerd, Minn. Grain-door lock	812,839	Feb. 20	2640	577	120	2150
Feust, Sigmund, New York, N. Y. Show-window	813,634	Feb. 27	4231	930	120	2555
Fichtner, Conrad, Goodrich, N. D. Shaping-tool	813,784	Feb. 27	4516	997	120	2616
Fick, Frank W., Maneys Corners, and P. S. Van Wie, Amsterdam, N. Y. Appliance and fixture for railway rails and ties	813,875	Feb. 27	4704	1041	120	2656
Fickes, John C., assignor to Buckeye Lubricating Company, Steubenville, Ohio. Lubricator	812,032	Feb. 6	1012	221	120	1694
Fidjeland, Terje A., Fostvedt, Iveland, Norway. Automatic rifle	813,694	Feb. 27	4339	955	120	2578
Fiebach, Frank A. R., H. C., and O. L., London, Wis. Corn-fodder elevator and loader	810,739	Jan. 23	4326	899	120	1067
Fiebach, Henry C. (See Fiebach, Frank A. R., H. C., and O. L.)						
Fiebach, Otto L. (See Fiebach, Frank A. R., H. C., and O. L.)						
Field, Stephen D., Stockbridge, Mass. Receiving telegraphic signals	812,557	Feb. 13	2105	462	120	1995
Field, William A., E. B. Clark, 2nd, and F. Wilson, Chicago, Ill., assignors to Wellman, Seaver, Morgan Company, Cleveland, Ohio. Reversing-valve	812,840	Feb. 20	2641	577–8	120	2150
Fielding, John S., Toronto, Canada. Dam, retaining-wall, or breakwater	813,695	Feb. 27	4343	956	120	2578
Fifer, Charles F., Boulder, Colo. Claw-hammer and spike-puller	812,985	Feb. 20	2926	645	120	2313
Finell, Chester C., Grand Junction, Iowa. Gas-burning tank-heater	810,852	Jan. 23	4540	945	120	1112
Fildes, Rollin D., assignor of one-half to L. Parish, Chicago, Ill. Hydraulic tool-clamp	808,647	Jan. 2	53	11	120	14
Fle, Eugene F., New York, N. Y., assignor of one-half to F. F. Slocomb & Co. Attachment for leather-staking machines	813,876	Feb. 27	4705	1041–2	120	2656
Filstrup, Lars L., assignor to Covel Manufacturing Company, Chicago, Ill. Saw-dressing machine	811,835	Feb. 6	557	123–4	120	1604
Finch, George P., assignor of two-thirds to A. M. Hill and W. H. Peck, Garnsill, Mont. Device for removing or replacing hay-racks or the like from or to their running-gear	808,913	Jan. 2	580	126	120	127
Finch, John S. (See Eames and Finch.)						
Findlay, William, Edinburgh, Scotland. Cover for vehicles	808,828	Jan. 2	403	88	120	90
Fink, Adolph E. (See Englemier, Charles W., assignor.)						
Fink-Huguenot, Laurent, Paris, France. Apparatus for the preparation of metallic oxids	813,785	Feb. 27	4517	997	120	2616
Fink-Huguenot, Laurent, Paris, France. Producing metallic oxids	813,786	Feb. 27	4519	997	120	2616
Finley, John H. (See Raymond and Finley.)						
Finney, David C., Huntsville, Ala. Thread-guide	809,457	Jan. 9	1667	347	120	403
Firnaes, Edward, *et al.* (See Salmon, Carl R., assignor.)						
Fischer, Adolph, Milwaukee, Wis. Horseshoe-pad	808,829	Jan. 2	404	88	120	90
Fischer, August. (See Lang and Fischer.)						
Fischer, Charles E., West Harrison, Ind. Collapsible truck	808,738	Jan. 2	234	51	120	53
Fischer, Jens J. O., assignor to himself and M. J. Goepfert, Racine, Wis. Anticreeping device for rails	808,648	Jan. 2	54	12	120	14
Fischer, Joseph B., assignor of one-half to E. A. Tesch, Chicago, Ill. Fishing-rod	813,492	Feb. 27	3954	887	120	2495
Fischer, William C., New York, N. Y., assignor to Standard Pulley Manufacturing Company. Sheave	812,488	Feb. 13	1951	430	120	1964

Alphabetical list of patentees for January and February—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume.		Official Gazette.	
			Spec.	Dr'g.	Vol.	Page.
Fisher & Company, J. M. (See Wallenthin, Nils C., assignor.)						
Fisher, Daniel C., Boston, Mass. Machine for disentangling fibers	808,978	Jan. 2	716	154–5	120	158
Fisher, Ebenezer, Philadelphia, Pa., assignor to Fisher Wrench Company, Egg Harbor, N. J. Pipe-wrench. (Reissue)	12,438	Jan. 23	4652	970	120	1135
Fisher, George F., North Tonawanda, N. Y. Building construction	813,548	Feb. 27	4060	800	120	2519
Fisher, Henry R. (See Schlosser and Fisher.)						
Fisher, John, *et al.* (See Salmen, Carl R., assignor.)						
Fisher, Martin E., Mineral City, Ohio. Making hard-rubber balls	810,740	Jan. 23	4328	.....	120	1068
Fisher Wrench Company. (See Fisher, Ebenezer, assignor.) (Reissue.)						
Fitch, Fred W. (See Rodney, Ford, Conroy, Burson, and Fitch.)						
Fitzgerald, John M. (See Tracy, John W., assignor.)						
Fitzgibbons, David, Oswego, N. Y. Steam-generator	809,366	Jan. 9	1527	310	120	370
Fitzkee, Archibald M., Atkinson, Ill. Safety-pocket	811,045	Jan. 30	4952	1034	120	1237
Fitzpatrick, Edward F., *et al.* (See Wyatt, George R., assignor.)						
Flager, Edward G. (See McGahan and Flager.)						
Flannery Bolt Company. (See Tate, John B., assignor.)						
Flannery, James J., *et al.* (See Hinkson, Frank B., assignor.)						
Flannery, Joseph M., *et al.* (See Hinkson, Frank B., assignor.)						
Flatau, Sol, administrator. (See Dancyger, Simon.)						
Flather, Herbert L., Nashua, N. H. Change-speed gearing for engine-lathes	810,634	Jan. 23	4147	857–8	120	1027
Flay, Robert. (See Hubbard and Flay.)						
Fleischer, Emil, Dresden-Strehlen, assignor to J. E. Goldschmid, Frankfort-on-the-Main, Germany. Manufacturing iron or steel	809,291	Jan. 9	1369	278	120	337
Fleming, Christopher C., Dallas, Tex. Saw-tooth	813,371	Feb. 20	3698	812	120	2378
Fleming, James R., Scranton, Pa. Axle-box	813,962	Feb. 27	4867	1076	120	2689
Fleming, William B., South Pasadena, Cal. Musical instrument	811,912	Feb. 6	728	159–60	120	1639
Flesher, Andrew, Taylorville, Ill. Safety-catch for elevators	811,046	Jan. 30	4953	1034	120	1237
Fletcher, Pearl E., Ridge, assignor of one-half to K. G. Warner, Pendleton, Oreg. Sickle	809,676	Jan. 9	2166	448	120	508
Fling, Walter T., and J. E. Nichols, Holt, Mo. Smoke-consumer	810,741	Jan. 23	4329	900	120	1068
Floeter, Robert K., Lima, Ohio. Automatic railway-switch	811,627	Feb. 6	194	41	120	1527
Flory, Llewellyn H., Ashley, Pa. Hair-pin	813,787	Feb. 27	4520	998	120	2616
Flowers, Alonzo H., Miami, Fla. Column	812,033	Feb. 6	1015	221	120	1695
Floyd-Wells Company. (See Brooke, Isaac, assignor.)						
Flynn, John K., Duluth, Minn. Stump-puller	813,666	Feb. 27	4345	956	120	2579
Focht, George, Hoboken, N. J. Street-sweeper's cart	808,739	Jan. 2	235	51	120	54
Foley, Philip J. (See Johnston and Foley.)						
Follett Manufacturing Company. (See Follett, Wilbur I., assignor.)						
Follett, Wilbur I., Summit, N. J. Time-recording apparatus	810,370	Jan. 16	3574	735	120	865
Follett, Wilbur I., Mendham, N. J., assignor to Follett Manufacturing Company, New York, N. Y. Hand dating-stamp	813,635	Feb. 27	4233	930	120	2555
Fontaine, Patrick H., Bethel Hill, N. C. Riding-saddle	809,179	Jan. 2	1093	227	120	240
Food & Fiber Products Company. (See Manns, Albert G., assignor.)						
Foote, Lewis A., assignor to Chicago Car Seal & Manufacturing Company, Chicago, Ill. Seal-press	811,283	Jan. 30	5431	1132	120	1339
Forberg, John. (See Skov and Forberg.)						
Forbes, Alexander A., Duluth, Minn. Machine for molding building-blocks	812,123	Feb. 6	1171	257–8	120	1727
Forbes, Andrew. (See Hough, Benjamin B., assignor.)						
Forbes, John D., Mill Valley, Cal. Planer-head and cutter	811,768	Feb. 6	437	95	120	1581
Forbes, John D., San Francisco, Cal. Planer-head	811,769	Feb. 6	438	95	120	1581
Forbes, John S., Philadelphia, Pa. Distilling and condensing	808,649	Jan. 2	56	12	120	15
Ford, Hannibal C., Jamaica, N. Y. Railway system	809,774	Jan. 9	2377	491	120	555
Ford, James J. (See Rodney, Ford, Conroy, Burson, and Fitch.)						
Ford, John M., Barrow-in-Furness, England. Experimental tank for testing ships' models	813,413	Feb. 27	3788	831–2	120	2455
Fordyce, Edmond A., Boston, Mass., assignor to Lamson Consolidated Store Service Company, Newark, N. J. Pneumatic-despatch-tube apparatus	813,636	Feb. 27	4234	930	120	2555
Foreman, Samuel E., Paducah, Ky. Tool-handle	811,300	Jan. 30	5626	1178	120	1381
Forquer, George, and A. R. Musick, Brashear, Mo. Spark-arrester	813,493	Feb. 27	3956	808	120	2495
Forrester, Eli T., Hot Springs, S. D. Railway-tie	810,200	Jan. 16	3211	665	120	784
Forrester, Eli T., Denver, Colo. Railway-rail joint	812,417	Feb. 13	1822	399	120	1936
Forrister, Isham G., Versailles, Ky. Rain-holder	812,034	Feb. 6	1016	221	120	1695
Forsyth, Robert H., Washington, D. C. Box for holding coins	810,742	Jan. 23	4330	900	120	1068
Forter Miller Engineering Company. (See Miller, James C., assignor.)						
Foesnight, Charles E., Warren, Ohio. Hair-pin	811,628	Feb. 6	197	42	120	1528
Fosselman, Christian A., *et al.* (See Hinsch, Gustave L., assignor.)						
Foster, Charles L., and P. K. Higgins, Los Angeles, Cal. Police signaling apparatus	812,733	Feb. 13	2430	532	120	2059
Foster, George W., Pawtucket, R. I. Thread-winding machine	813,372	Feb. 20	3696	813	120	2378
Foster, John, Rochester, N. Y. Stanchion	813,788	Feb. 27	4521	998	120	2616
Foster, Samuel T., Jr., Victoria, Mexico, assignor of three-fourths to O. C. Billman, Lodi, Ohio. Electric gun	811,913	Feb. 6	731	160	120	1639
Foster, Theodore W., Providence, R. I. Bracelet	813,697	Feb. 27	4346	957	120	2579
Foster, W. S., *et al.* (See Branson, Tilghman E., assignor.)						
Fougerat, Charles, Lyon, France. Apparatus for permitting the successive exhibition of photographs	808,530	Jan. 2	405	80	120	90
Fourneaux, Emile A., assignor to H. A. Metz, New York, N. Y. Formaldehyde hydrosulfite and making same	812,124	Feb. 6	1176	.....	120	1729
Fowle, Charles L., assignor to Dowagiac Manufacturing Company, Dowagiac, Mich. Seedbox for grain-drills	808,979	Jan. 2	718	155	120	159
Fowler, Lewis D., assignor of one-half to I. A. Kness, Oklahoma, Okla. Ter. Folding transportation poultry-coop	811,047	Jan. 30	4954	1034	120	1237
Fowler, Samuel J., Cambridge, Mass. Stand-pipe and connection for gas-retorts	808,831	Jan. 2	405	89–90	120	90
Fowler, Thomas, Beaumont, Tex. Car-truck bolster	811,493	Jan. 30	5602	1215	120	1416
Fowler, Thomas R. (See Tabler, Frank C., assignor.)						
Fowler, William, Colorado Springs, Colo. Electrical hose signaling apparatus	811,536	Feb. 6	539	124–5	120	1604
Fox, Annie, Marietta, Mich. Jar-holder	813,780	Feb. 27	4522	998	120	2617
Fox, Ansley H., Philadelphia, Pa. Barrel-locking device for breakdown guns	810,046	Jan. 16	2693	597	120	719
Fox, Frank A. (See Graham and Fox.)						
Fox, John H., New York, assignor to Mott Carbonator Company, Utica, N. Y. Beverage-carbonator	813,414	Feb. 27	3789	832	120	2455
Fox, William T., Rochester, N. Y. Gas-engine	809,292	Jan. 9	1371	276–9	120	337
Fralick, Charles F. (See Waite and Fralick.)						
Francisque, Constant. (See Brown and Francisque.)						
Frank, David, *et al.* (See Sebastil, Jager, and Walsleben, assignors.)						
Frank, Harry J., Philadelphia, Pa. Dumping-wagon	812,734	Feb. 13	2433	532–3	120	2059
Frank, Henry C., New York, N. Y. Cuff-holder	811,210	Jan. 30	4389	1103	120	1303

Alphabetical list of patentees for January and February—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume.		Official Gazette.	
			Spec.	Dr'g.	Vol.	Page.
Frank, John J., Schenectady, N. Y., assignor to General Electric Company. Transformer	808,740	Jan. 2	237	51	120	54
Frank, Robert J., assignor to Standard Audit Company, Chicago, Ill. Loose-leaf ledger	809,914	Jan. 9	2601	536	120	605
Franklin, Edward A., Austin, Tex. Vapor-burner	813,494	Feb. 27	3957	808	120	2495
Franklin, James W., Boston, Ga. Nut-lock	812,035	Feb. 6	1017	222	120	1695
Franquist, Gustave E., New York, N. Y. Muffler	813,203	Feb. 20	3359	738	120	2307
Frantz, Peter. (See Dillon and Frantz.)						
Franz, Charles J., Baltimore, Md. Button or check	810,635	Jan. 23	4151	858	120	1027
Franz, Friederich, Corona, N. Y. Tool for grinding glass plates	809,499	Jan. 9	1812	373	120	433
Frayer, Lee A., and W. J. Miller, Columbus, Ohio. Engine-driven blower for explosion-engines	813,204	Feb. 20	3360	738	120	2307
Frazee, William, *et al.* (See Faulk, James M., assignor.)						
Frazer, Anne E. W., Washington, D. C. Amusement-railway	811,211	Jan. 30	5290	1107	120	1308
Frech, George F. (See Wolfe and Frech.)						
Freda, Frank J., Detroit, Mich. Buttonhole attachment for sewing-machines	808,914	Jan. 2	582	128	120	127
Fredlund, Henning A., Dubuc, Canada. Rotary engine	809,180	Jan. 2	1095	228	120	241
Freel, William S., Bay City, Mich. Fishing device	811,555	Feb. 6	33	8	120	1492
Freeman, Frank A., Philadelphia, Pa. Fastening device	811,494	Jan. 30	5803	1215	120	1417
Freeman, Willard S., St. Cloud, Minn. Alarm for incubators	810,931	Jan. 30	4741	989	120	1190
Freeman, William, New York, N. Y. Printed dress-pattern	811,770	Feb. 6	439	95–6	120	1582
Freese, John, *et al.* (See Caughey, Albert E., assignor.)						
Freitag, Andreas, Amsterdam, Netherlands, assignor to Watson, Laidlaw & Company, Glasgow, Scotland. Centrifugal machine	813,963	Feb. 27	4869	1077	120	2689
Fremaux, Louis. (See Crepy and Fremaux.)						
French, Edson B., Helena, Mont. Combined curtain-pole and shade-roller support	811,629	Feb. 6	197	42	120	1528
French, John R., Los Angeles, Cal. Pneumatic riveting-machine	812,787	Feb. 13	2529	556	120	2080
French, Tomson E., Davenport, Iowa. Window-crane	809,104	Jan. 2	909	201	120	214
Frenk, William F. (See Smith and Frenk.)						
Frentzen, Albertus W., and J. Schoemaker, Leiden, Netherlands. Instrument for removing ribs	813,877	Feb. 27	4707	1042	120	2657
Frenzel, John A., Wausau, Wis. Train-pipe coupling	813,637	Feb. 27	4237	931	120	2556
Freschi, Alfred, Chicago, Ill. Flexible adhesive brace	813,790	Feb. 27	4523	998	120	2617
Freshman, Sam, *et al.* (See Moeckel, Aratine G., assignor.)						
Fretts, George H., Springfield, Mass. Electrically-operated controlling mechanism	813,638	Feb. 27	4238	931	120	2557
Frey, Jacob A. (See Knollenberg and Frey.)						
Fridman, William M. (See Lancaster, John P., assignor.)						
Friede, Samuel M., assignor of one-half to H. W. Carter, Chicago, Ill. Amusement apparatus	809,937	Jan. 16	2652	548	120	668
Friede, Samuel M., assignor to Revolving Air Ship Tower Company, Chicago, Ill. Revolving air-ship tower	813,549	Feb. 27	4062	800–1	120	2519
Friedel, Albert H., New York, N. Y. Shell	811,048	Jan. 30	4956	1035	120	1238
Friedenthal, Albert, Oakland, Cal. Game apparatus	809,293	Jan. 9	1374	279	120	338
Friedenwald Company of Baltimore City. (See Billstein, Aaron, assignor.)						
Friedman, John L., and J. Graham, Lawton, Okla. Ter. Cattle-guard	811,049	Jan. 30	4957	1035	120	1238
Friedman, Samuel, New York, N. Y. Tuck-guide for sewing-machines	812,558	Feb. 13	2108	462	120	1996
Friedrich, Ernst W., Blaton, Belgium. Cellulose solution	813,878	Feb. 27	4709	.....	120	2658
Frieg, Franz, Ludwigsburg, Germany. Knife-polishing machine	812,489	Feb. 13	1952	430	120	1964
Friese, Adolph H., New York, N. Y. Nail-clipper	810,402	Jan. 23	3682	758	120	922
Fringer, Charles F., Lithia, Va. Door-lock	809,610	Jan. 9	2033	421	120	478
Frisbee, Daniel D. (See Graves, George W., assignor.)						
Frist, Robert P., Bridgeton, N. J., assignor to S. S. Stafford, Incorporated, New York, N. Y. Paste-pot	813,086	Feb. 20	3125	685	120	2257
Fritz, John H., Ainsworth, Nebr. Draft attachment for vehicles	813,639	Feb. 27	4240	932	120	2557
Frizzell, William L. (See Vickery, Frank E., assignor.)						
Frohlich, George W. Chicago, Ill. Window-ventilator	809,500	Jan. 9	1813	373	120	433
Fruehauf, William F., Plainfield, N. J. Clinical thermometer	812,559	Feb. 13	2111	462	120	1996
Fruehauf, William F., Plainfield, N. J. Clinical thermometer	812,560	Feb. 13	2112	462	120	1997
Fruin, John L., New York, N. Y. Combined fitting for closets and sinks	809,938	Jan. 16	2654	548	120	666
Fruin, John L., New York, N. Y. Plumbing system	810,047	Jan. 16	2696	597	120	720
Fry, Speed S., Breckenridge, Colo. Calculator	809,294	Jan. 9	1374	279	120	338
Fryer, George G., Syracuse, N. Y. Coke-handling apparatus	808,741	Jan. 2	239	52	120	54
Fuchs & Lang Manufacturing Co. (See Haenlein, Louis, assignor.)						
Fuel Saver Heating Company. (See Hampden, Wellesley R., assignor.)						
Fuller, Harvey R., Kirksville, Mo. Method of instruction	812,107	Feb. 13	1387	301	120	1842
Fuller, James W., Jr., Catasauqua, Pa. Producing self-lubricating car-wheels	813,146	Feb. 20	3263	717	120	2287
Fuller, Louis C., Kansas City, Mo. Incandescent gas-lamp	811,050	Jan. 30	4960	1035	120	1238
Fulton Company. (See Fulton and Richards, assignors.)						
Fulton, Weston M., and W. H. Richards, assignors to Fulton Company, Knoxville, Tenn. Reservoir for gasolene and other vapor burners	810,403	Jan. 23	3683	758–9	120	922
Funck, Philipp. (See Tierney and Funck.)						
Furchtbar, John J., Joetta, Ill. Vehicle	809,048	Jan. 2	842	179	120	186
Furlow, Floyd C., Montclair, assignor to Otis Elevator Company, East Orange, N. J. Retarding device for plunger-elevators	810,404	Jan. 23	3685	759	120	923
Gabriel, Charles R., assignor to Brown & Sharpe Manufacturing Company, Providence, R. I. Gearing	809,915	Jan. 9	2603	536	120	606
Gabryszek, Wladyslaw J., Greenbay, Wis. Catafalque	811,495	Jan. 30	5805	1215	120	1417
Gaebel, Carl. (See Winter, Carl, assignor.)						
Gaertner, Frederick W., Niagara Falls, N. Y. Extracting albumin from vegetable substances	813,373	Feb. 20	3701	814	120	2378
Gall, John F., assignor to Simmons Manufacturing Company, Kenosha, Wis. Machine for making coil-springs	810,048	Jan. 16	2698	597–607	120	720
Gale, Georgiana C. (See Gale, Henry A., assignor.)						
Gale, Henry A., assignor to G. C. Gale, Hartford, Conn. Machine for forming box-shooks	808,742	Jan. 2	242	52–3	120	55
Gale, Horace B., Natick, and F. M. Dewing, Boston, Mass., assignors to Submarine Signal Company, Waterville, Me. Means for producing sound-vibrations in water	813,964	Feb. 27	4870	1077	120	2690
Gallagher, Fred E., assignor of two-thirds to S. L. Phillips and W. D. Valentine, San Francisco, Cal. Receiver and recorder for wireless and other transmissions	808,832	Jan. 2	409	90	120	91
Gallagher, John C., Elmira, N. Y. Controlling device for motor-vehicles	809,916	Jan. 9	2605	536–7	120	606
Gallagher, Joseph D., Glenridge, N. J. Brake-shoe	810,405	Jan. 23	3689	759	120	924
Gallagher, William L., Point Reys Station, Cal. Stopper retaining and extracting device	810,331	Jan. 16	3490	721	120	844
Galland, George, assignor to M. S. Galland, Wilkes-Barre, Pa. Display-form	812,986	Feb. 20	3929	645	120	2214
Galland, Minnie S. (See Galland, George, assignor.)						
Galloway, John W., Linton, Ind. Pianoforte	813,791	Feb. 27	4524	999	120	2617

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Gallup, Lloyd G., Walton, N. Y. Brake block and shoe	813,640	Feb. 27	4241	932	120	2558
Galopin, Henri, Melbourne, Victoria, Australia. Mechanism for automatically distributing liquid fuel	809,436	Jan. 9	1691	348	120	404
Gamble, John, assignor to G. A. Reach, Philadelphia, Pa. Base-ball-catcher's mitt	808,960	Jan. 2	721	155	120	159
Gamboa, John M., St. Louis, Mo. Non-refillable bottle	810,480	Jan. 23	3843	789	120	960
Gammeter, Harry C., assignor to American Multigraph Company, Cleveland, Ohio. Feeding mechanism for printing-machines	812,735	Feb. 13	2434	533	120	2060
Gandert, Fredrick. (See Barr and Gandert.)						
Garber, Chester A., Brookville, Ohio. Railway-mail-bag device	811,710	Feb. 6	335	74	120	1560
Gardiner, Benjamin P., assignor to Petroleum Electric Producing Company, Chicago, Ill. Electric heater for oil-wells and making same	809,917	Jan. 9	2606	537	120	606
Gardiner, Edmund E., Hamler, Ohio. Combined punch and shears	812,845	Feb. 13	2269	494	120	2026
Gare, Thomas, New Brighton, England. Wheel for vehicles	810,526	Jan. 23	3941	811	120	962
Garland, Michael, assignor to M. Garland Company, Bay City, Mich. Resawing attachment for band-saws	812,987	Feb 20	2930	645-6	120	2214
Garnett, Harrison, Norristown, Pa. Loom-shuttle check	811,130	Jan. 30	5143	1078	120	1276
Garnett, William H., Little Rock, Ark. Non-refillable bottle	810,481	Jan. 23	3944	790	120	960
Garney, Edythe P., Scranton, Pa. Telephone or other booth	811,140	Jan. 30	5144	1078	120	1276
Garretson, Frank B., Worcester, Mass. Filling attachment for sight-feed oilers	811,051	Jan. 30	4960	1036	120	1236
Garrett-Cromwell Engineering Company. (See Cromwell, John C., assignor.)						
Garrett, Myers A., Chicago, Ill. Centering device for draw-bars	809,151	Jan. 2	1097	228	120	241
Garrett, Samuel H., West Philadelphia, Pa. Window-screen	812,490	Feb. 13	1962	430	120	1964
Garrett, William O., Maryville, Mo. Stock-watering apparatus	810,111	Jan. 16	3025	629-30	120	751
Garton-Daniels Company. (See Jones, Walter C., assignor.)						
Garvin Cyanide Extraction Company. (See Garvin, Edward J., assignor.)						
Garvin, Edward J., Portland, Oreg., assignor to Garvin Cyanide Extraction Company. Apparatus for recovering precious metals	809,989	Jan. 16	2655	549	120	668
Gaskine, Lindsey, Hamilton, Va. Automatic bell-signal for railway-track crossings	810,112	Jan. 16	3027	630	120	752
Gates, Harvey P., Remington, Ind. Block-molding machine	809,367	Jan. 9	1528	310	120	370
Gates, Walter. (See Olsen and Gates.)						
Gates, William H., Worcester, Mass. Drive-chain	811,391	Jan. 30	5627	1178	120	1381
Gatsert, Abraham N. (See Berens and Gatsert.)						
Gatsert, Abraham N., Chicago, and S. Berens, La Grange, Ill. Illuminating-sign	813,087	Feb. 20	3126	685	120	2258
Gault, Frank M., Oklahoma, Okla. Ter. Poultry-shipping coop	809,558	Jan. 9	1918	398	120	455
Gault, Frank M., Oklahoma, Okla. Ter. Crate for transporting poultry	809,559	Jan. 9	1919	398-9	120	455
Gaven, William J. (See Hoyt and Gaven.)						
Gaylor, Leonard B., Newton Center, Mass. Automobile	810,636	Jan. 23	4152	858	120	1028
Gaylord, Edwin S. (See Hartenbergh, John C., assignor.)						
Gaynor, Thomas F., New York, N. Y., assignor to Electric Amusement Company. Electric race-track	811,264	Jan. 30	5433	1132-3	120	1340
Gegner, John P., Sandusky, Ohio. Attachment for horseshoes	809,105	Jan. 2	972	201	120	215
Gehr, John H., Waynesboro, Pa. Wall-mold	809,106	Jan. 2	973	201	120	215
Gehrsbma, Edward F., Schenectady, N. Y., assignor to General Electric Company. Starting-compensator for alternating-current motors	809,677	Jan. 9	2167	448	120	508
Geisenhöner, Henry, Schenectady, N. Y., assignor to General Electric Company. Machine for shaping the ends of metal bars	811,771	Feb. 6	441	96	120	1562
General Chemical Company. (See Knietsch, Rudolf, assignor.)						
General Electric Company. (See Anderson, Edward H., assignor.)						
General Electric Company. (See Armstrong, Albert H., assignor.)						
General Electric Company. (See Arsem, William C., assignor.)						
General Electric Company. (See Barry, Charles E., assignor.)						
General Electric Company. (See Batcheldor, Asa F., assignor.)						
General Electric Company. (See Callan, John G., assignor.)						
General Electric Company. (See Callan and Boyd, assignors.)						
General Electric Company. (See Case, Frank E., assignor.)						
General Electric Company. (See Churchward, Alexander, assignor.)						
General Electric Company. (See Corey, Fred B., assignor.)						
General Electric Company. (See Day, Maxwell W., assignor.)						
General Electric Company. (See Emmet, William L. R., assignor.)						
General Electric Company. (See Frank, John J., assignor.)						
General Electric Company. (See Gehrsbma, Edward F., assignor.)						
General Electric Company. (See Geisenhöner, Henry, assignor.)						
General Electric Company. (See Gomborow, Josef, assignor.)						
General Electric Company. (See Herman, Reinhold, assignor.)						
General Electric Company. (See Jackson, Alexander M., assignor.)						
General Electric Company. (See Keller, Huldreich, assignor.)						
General Electric Company. (See Kay, James F., assignor.)						
General Electric Company. (See Kruesi, August H., assignor.)						
General Electric Company. (See Latour, Marius C. A., assignor.)						
General Electric Company. (See Lamp, Hermann, assignor.)						
General Electric Company. (See Linn, John B., assignor.)						
General Electric Company. (See Möller, Karl, assignor.)						
General Electric Company. (See Newton, Arthur D., assignor.)						
General Electric Company. (See Ober, Julius E., assignor.)						
General Electric Company. (See Potter, William B., assignor.)						
General Electric Company. (See Reist, Henry G., assignor.)						
General Electric Company. (See Rice, Edwin W., Jr., assignor.)						
General Electric Company. (See Riddell, John, assignor.)						
General Electric Company. (See Samuelson, Frederick, assignor.)						
General Electric Company. (See Sargent, Howard R., assignor.)						
General Electric Company. (See Steinmetz, Charles P., assignor.)						
General Electric Company. (See Stevens, George E., assignor.)						
General Electric Company. (See Stone, Fred L., assignor.)						
General Electric Company. (See Stumpf, Johann, assignor.)						
General Electric Company. (See Thomas, Elihu, assignor.)						
General Electric Company. (See Wilson, Howard B., assignor.)						
General Electric Company. (See Wood, Montravile M., assignor.)						
General Fire Appliance Company. (See Donnelly, William T., assignor.)						
General Fireproofing Company. (See Shepard, James A., assignor.)						
General Fireproofing Company. (See Shaw, John A., assignor.)						
General Railway Signal Company. (See Townsend, Frederick, assignor.)						
General Refining Company. (See Filer, Joseph, assignor.)						
General Refining Company. (See Lyndon, Lemuel, assignor.)						
General Refining Company of West Virginia. (See Gibson, David, assignor.)						
Gibson, David, assignor to Gibson Coal Manufacturing Company of West Virginia, Baltimore, Md. Mining subsided anthracite compounds	809,705	Jan. 9	1980	492	120	555

Alphabetical list of patentees for January and February—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Geneux, Emile C., Jeanerette, La. Railway-rail	812,988	Feb. 20	2933	646	120	2214
Geometric Tool Company. (See Leonard, Wilbur A., assignor.)						
George, Jerome R., assignor to Morgan Construction Company, Worcester, Mass. Gas-producer	809,295	Jan. 9	1375	279	120	338
George, Joseph F., New York, N. Y., assignor, by mesne assignments, to Empire Electric Stage Lighting Company. Electrical switch	810,527	Jan. 23	3942	811	120	962
Geraci, Ignatius, assignor of one-half to C. Linkins, Washington, D. C. Tailor's measure	813,415	Feb. 27	3793	832	120	2456
Gerding, Herbert. (See Schultz and Gerding.)						
Gerdon, Gregory, Watervliet, N. Y., assignor to Ordnance Improvement Company. Firing mechanism for breech-loading guns	809,107	Jan. 2	974	201	120	215
Gerhardt, August H. L., Bettenhausen, near Cassel, Germany. Apparatus for continuously distilling benzin and the like	810,637	Jan. 23	4155	858	120	1028
Gerlach, Gustav B., assignor of one-half to Ketling & Braun, Crimmitzschau, Saxony, Germany. Machine for steaming cloth	810,271	Jan. 16	3372	698	120	819
Gerow, James W., et al. (See Birmingham, John P., assignor.)						
Gesellschaft für Industrielle Feuerungsanlagen m. b. H. (See Lutzner, Maximilian A., assignor.)	812,198	Feb. 13	1388	201-2	120	1842
Gessert, Jacob, Buffalo, N. Y. Bit-brace	810,638	Jan. 23	4156	859	120	1029
Gessner, David, Worcester, Mass. Cloth-pressing machine						
Gex, Michael. (See Chevan and Gex.)						
Geyerman, Peter T., Brewster, Minn. Telephone-call	811,052	Jan. 30	4962	1036	120	1239
Gharky, William D., Philadelphia, Pa. Telephone transmitter-arm	812,125	Feb. 6	1178	258	120	1729
Gianera, Peter A., Gualala, Cal. Saw-set	811,392	Jan. 30	5628	1178	120	1382
Gibbons, Robert P., Kopa, New Zealand. Compound steam-engine	812,199	Feb. 13	1391	302	120	1842
Gibbs, David, Livonia, N. Y. Crate	810,272	Jan. 16	3372	698	120	819
Gibson, Arthur H., Easton Pa., assignor to Ingersoll-Sergeant Drill Company, New York N. Y. Rock-drill	810,639	Jan. 23	4159	859	120	1029
Gibson, William D. (See Thompson, Hamlin T., assignor.)						
Giddings, Frank D., Fort Collins, Colo. Water head-gate	811,212	Jan. 30	5292	1107	120	1309
Gieseler, Arthur, Dayton, Ohio. Turbine-water-wheel construction	814,002	Feb. 27	4950	1085	120	2705
Gifford, Dexter N., and J. Hall, Brooklyn, N. Y. Apparatus for aerating, purifying, and cooling milk	811,053	Jan. 30	4965	1036	120	1239
Gifford, William, assignor of one-half to E. M. Dixon, Thompsonville, Mich. Lightning-arrester	812,126	Feb. 6	1179	258	120	1729
Gihon, George H., San Francisco, Cal. Printing apparatus	810,743	Jan. 23	4332	900-2	120	1088
Gilbert, Frank B., Minneapolis, Minn. Telephone memorandum attachment	812,841	Feb. 20	2645	579	120	2150
Gilbert, George T., Northampton, assignor of one-third to W. D. Hamilton, Springfield, Mass. Automatic prick-punch	813,641	Feb. 27	4242	932	120	2558
Gilbert, Pearl, Newport, R. I. Soldering-iron	813,374	Feb. 20	3703	814	120	2379
Gilbert, William F., Derby, assignor of one-half to H. C. Cook Co., Ansonia, Conn. Pocket finger-nail cleaner	810,744	Jan. 23	4337	902	120	1089
Gilbough, Benjamin G., Chicago, Ill. Spur	810,049	Jan. 16	2918	607	120	726
Gilliard, Christopher G., Swansea, Mass. Low-water alarm for steam-boilers	811,213	Jan. 30	5293	1107	120	1309
Gilliard, Christopher G., Swansea, Mass. Low-water alarm for steam-boilers	811,214	Jan. 30	5296	1108	120	1309
Gilpin, Adolph C., Passaic, assignor to New York Automatic Telephone Company, Paterson, N. J. Telephone-switch-plug mechanism	812,491	Feb. 13	1964	431	120	1964
Gill, Charles H., Litchfield, Ill. Semaphore-signal attachment	809,678	Jan. 9	2180	449	120	509
Gill, Charles H., assignor, by mesne assignments, of one-half to C. H. Rickard, Kalamazoo, Mich. Carriage-top	810,932	Jan. 30	4742	989	120	1190
Gill, Edwin R., Yonkers, N. Y. Support for incandescent lamps	811,837	Feb. 6	565	125	120	1606
Gill, John. (See Mackenzie and Ross, assignors.)						
Gill, Samuel E. (See Stewart, Francis L., assignor.)						
Gilland, Homer E. and W. H., Saginaw, Mich. Rolling window-screen	813,642	Feb. 27	4244	932	120	2558
Gilland, William H. (See Gilland, Homer E. and W. H.)						
Gillchrist, Edward A., McKeesport, Pa. Cross-tie and means for holding track-rails thereon	813,205	Feb 20	3261	720	120	2207
Gillenwaters, Grant F., East Sacramento, Cal. Poultry-fountain	811,914	Feb. 6	733	160	120	1640
Giller, Hugo, New York, N. Y. Coin-controlled clock and money-box	812,200	Feb. 13	1393	302-3	120	1843
Gillespie, Charles C., Chicago, Ill. Chemical fire-pail	812,646	Feb. 13	2271	494	120	2026
Gillespie, Robert T., Lisbon, Ohio. Reservoir-pen	812,647	Feb. 13	2272	495	120	2027
Gillett, Vernor J., Detroit, Mich. Mattress-holder for folding beds	809,049	Jan. 2	843	179	120	186
Gillette Safety Razor Company. (See Nickerson, William E., assignor.)						
Gillinder & Sons. (See Booth, Kraft, assignor.)						
Gillmore, John L. (See Stanley and Gillmore.)						
Gilloon, Thomas. (See Morgans and Gilloon.)						
Gilman, George H., St. Paul, Minn. Lifting-jack	810,482	Jan. 23	3845	790	120	961
Gilmer, George C., assignor, by mesne assignments, to American Turpentine and Tar Company, Limited, New Orleans, La. Refining turpentine	813,088	Feb. 20	3128	685	120	2258
Gilpin, Charles D., assignor to Electric Controller & Supply Company, Cleveland, Ohio. System of control for electric motors	813,879	Feb. 27	4710	1042-3	120	2656
Gilson, Lewis, Colorado Springs, Colo. Railway	813,416	Feb. 27	3795	833	120	2457
Gipp, Emanuel C., Chicago, Ill. Extensible chain	811,054	Jan. 30	4966	1037	120	1240
Girardot, Léonce, Futeaux, France. Mounting and automatically adjusting the lamps of motor road-vehicles	812,201	Feb. 13	1395	303	120	1843
Girard, Emile, Paris, France. Overhead line	812,861	Feb. 13	2114	463	120	1997
Gladish, Theodore, Petersburg, Ind. Corn harvester and husker	812,736	Feb. 13	2436	534-5	120	2080
Glass, Perley R., Quincy, assignor to Peerless Machinery Company, Boston, Mass. Machine for inserting lacing-studs	811,838	Feb. 6	567	125	120	1606
Glass, Perley R., Quincy, assignor to Peerless Machinery Company, Boston, Mass. Machine for setting lacing hooks or studs	811,839	Feb. 6	571	125-6	120	1606
Glass, Perley R., Quincy, assignor to Peerless Machinery Company, Boston, Mass. Hook-setting machine	811,840	Feb. 6	580	127	120	1606
Glass, Perley R., Quincy, assignor to Peerless Machinery Company, Boston, Mass. Hook-setting machine	811,841	Feb. 6	582	127	120	1606
Glatfelter, Emerson C., New Philadelphia, Ohio. Machine for forming concrete blocks	812,236	Feb. 13	1664	365	120	1904
Glenny, John J., assignor to Edward E. Rieck Company, Pittsburg, Pa. Ice-cream mould	813,375	Feb. 20	3705	814	120	2379
Gleason, Charles A. (See Robbs, Harry B., assignor.)						
Gleason, John L., Boston, Mass. Universal molding-box	811,773	Feb. 6	443	96	120	1563
Gleason, Albert, assignor of one-half to S. O. Kloss, Scranton, Iowa. Tile-molding machine	809,940	Jan. 16	2661	549-50	120	670
Gley, Richard, assignor to Action Gesellschaft für Anilin Fabrikation, Berlin, Germany. Oxyazine-rubber dye and making same	812,642	Feb. 27	4245		120	2422
Glidden, Frederick A., Cleveland, Ohio. Vacuum for skipping vessels	810,488	Jan. 23	3847	790	120	961
Globe Optical Company. (See Slade and Bower, assignors.)						
Gluck, Eugene F. (See Thomas, Avis, assignor.)						
Glückler, Gottlieb, Stuttgart, Germany. Water-conductor	809,941	Jan. 16	2665	550	120	671

Glover, Charles, assignor to Corbin Screw Corporation, New Britain, Conn. Bearing	811,630	Feb. 6	198	42	120	1526
Glunt, Samuel P., Union City, Ind. Separating buckhorn and plantain seed from clover and alfalfa seed	813,495	Feb. 27	3959	868	120	2496
Gluyas, Charles, Johannesburg, Transvaal. Apparatus for treating slimes, &c., for the recovery of the precious metals	812,418	Feb. 13	1823	399–400	120	1937
Goddard, Lewis W. (See Strauhs, Francis M., assignor.)						
Goeb, Rudolph W., assignor to United States Fiber Stopper Company, St. Louis, Mo. Measuring-valve mechanism	809,439	Jan. 9	1693	348	120	405
Goepfert, Martin J. (See Fischer, Jens J. O., assignor.)						
Goerts & Co., Aug. (See Eigen, Benno vom, assignor.)						
Goff, Frank C., Denver, Colo. Device for circulating steam, &c	809,253	Jan. 2	1286	262–3	120	283
Golden, Edward B., Galt, assignor to A. F. Hatch, Toronto, Canada. Combined brush and mop holder	813,550	Feb. 27	4067	891	120	2520
Golden, George W., Detroit, Mich. Grinder	809,264	Jan. 2	1290	263	120	284
Golden, John P., Columbus, Ga. Feed-box for cane-mills	809,440	Jan. 9	1696	348	120	406
Golden, John P., Columbus, Ga. Evaporating-pan	813,089	Feb. 20	3131	686	120	2258
Goldman, Gustav, Baltimore, Md. Fabric containing haircloth	810,933	Jan. 30	4744	989	120	1190
Goldman, Gustav, Baltimore, Md. Making fabric containing haircloth	810,934	Jan. 30	4746		120	1190
Goldmann, Carl, assignor of one-half to E. Kehr, New York, N. Y. Box-opener	810,935	Jan. 30	4747	990	120	1191
Goldschmid, Jacob E. (See Fleischer, Emil, assignor.)	809,050	Jan. 2	845	179	120	187
Goldsmith, Maurice, New York, N. Y. Bag-handle	811,215	Jan. 30	5299	1108	120	1310
Golombek, Sigmund, New York, N. Y. Clock-movement	813,644	Feb. 27	4246	933–4	120	2558
Goltstein, Ewald, Cologne, Germany. Bottle-sealing mechanism	808,833	Jan. 2	411	90–1	120	91
Goltstein, Ewald, Cologne, Germany. Apparatus for closing bottles by means of metal capsules	812,648	Feb. 13	2275	495	120	2027
Gomborow, Joel, Lynn, Mass., assignor to General Electric Company. System of distant electrical control	811,773	Feb. 6	446	97	120	1583
Gooch, Shadrack W., Bridgeport, Ohio, and W. C. Leasure, Wheeling, W. Va. Hose-coupling	813,792	Feb. 27	4525	999	120	2617
Good, Alvah W., Zanesville, Ohio. Hat and coat rack	811,711	Feb. 6	336	74	120	1561
Good, Ezra E., Waterloo, Iowa, assignor to Sanitary Cow Milking Company, Minneapolis, Minn. Milking apparatus	812,842	Feb. 20	2646	579	120	2150
Good, John, New York, N. Y., assignor to John Good Cordage Co. Tension device	811,141	Jan. 30	5145	1075	120	1276
Goode, Curtis B., Boston, Mass. Power-brake mechanism	812,989	Feb. 20	2934	646–7	120	2214
Goodknight, Alva L., Council Bluffs, Iowa. Air-brake mechanism	813,090	Feb. 20	3131	686	120	2258
Goodman, Bradford L. (See Goodman, Oliver G. and B. L.)						
Goodman, Oliver G. and B. L., Birmingham, England. Collar-supporter	812,127	Feb. 6	1181	259	120	1730
Goodrich, Clarence L., assignor to Pratt & Whitney Company, Hartford, Conn. Tool-holder	808,981	Jan. 2	721	156	120	159
Goodrum, Charles L., Rochester, N. Y. Relay	808,534	Jan. 2	412	91	120	91
Goodsell, Harry H., Indiana Harbor, Ind. Treating metals	813,208	Feb. 20	3363	730	120	2308
Goodson, Lydia A., Elgin, and W. A. Nason, Algonquin, Ill. Invalid-bed	809,051	Jan. 2	846	180	120	187
Goodspeed, Arthur B., East Orange, N. J., assignor to Industrial Development Company, New York, N. Y. Carbureter and igniter for hydrocarbon-engines	808,915	Jan. 2	583	129	120	126
Goodwin, Charles, East Providence, R. I. Eyeglass-guard	809,268	Jan. 9	1530	311	120	371
Goodyear, Nelson, Flushing, N. Y., assignor to J. B. Colt Company. Gas-generator	808,650	Jan. 2	59	12–13	120	15
Goodyear, William E., Boston, Mass. Buttonhole-stitching machine	809,052	Jan. 2	849	180	120	188
Gordon, Albert A., Jr., Worcester, Mass., assignor to Crompton & Knowles Loom Works. Brake mechanism of looms	810,113	Jan. 16	3029	630	120	752
Gordon, Albert A., Jr., Worcester, Mass., assignor to Crompton & Knowles Loom Works. Loom for making pile fabrics	811,842	Feb. 6	586	128	120	1606
Gordon, Alexander, Weiser, Idaho. Manufacture of sand-lime bricks	809,063	Jan. 2	852	181	120	186
Gordon, Charles, Milwaukee, Wis. Drill-chuck	809,296	Jan. 9	1378	280	120	339
Gordon, Robert J., Detroit, Mich. Rivet-holder	808,535	Jan. 2	415	91	120	92
Gordon, Walter T., Juniper, Oreg. Draper	808,916	Jan. 2	585	129	120	126
Gordon, William F. (See Bartlett and Gordon.)						
Gordon, William W., Washington, D. C. Car-coupling	809,255	Jan. 2	1292	263	120	284
Gorman, James P., Jr., New York, N. Y. Electric-traction system	813,287	Feb. 20	3522	776	120	2341
Gormley, James R., Chicago, J. Gormley and P. Conley, Rockford, Ill. Smoke-consumer	808,917	Jan. 2	586	129	120	126
Gormley, John. (See Gormley and Conley.)						
Gormley, William, Chicago, Ill. Pipe-wrench	813,645	Feb. 27	4251	934	120	2559
Goss, George F., Wallaceton, Pa., and J. E. Parker, Washington, D. C.; said Parker assignor to said Goss. Game-register	813,551	Feb. 27	4068	892–3	120	2521
Goss Printing Press Company. (See Goss, Samuel G., assignor.)						
Goss, Samuel G., assignor to Goss Printing Press Company, Chicago, Ill. Delivery apparatus for printing-presses	812,923	Feb. 20	2795	615–16	120	2184
Goss, Samuel G., assignor to Goss Printing Press Company, Chicago, Ill. Stereotyping apparatus	812,924	Feb. 20	2801	616–17	120	2186
Gossett, William, Falls City, Nebr. Wheelbarrow	811,285	Jan. 30	5440	1134	120	1241
Gottlieb, Edward O. (See Zaczek and Gottlieb.)	812,990	Feb. 20	2936	647	120	2215
Gould Coupler Company. (See Richards, Willard F., assignor.)						
Gould Storage Battery Company. (See Richards, Willard F., assignor.)						
Gouldsberry, Joseph H., Teutonia, W. Va. Cylinder-boring machine	810,114	Jan. 16	3032	631	120	752
Gourdin, John K., Pineville, assignor of one-half to R. L. Montague and R. P. Tucker, Charleston, S. C. Axle-bearing	813,880	Feb. 27	4714	1043	120	2659
Gourdin, John K., Pineville, assignor of one-half to R. L. Montague and R. P. Tucker, Charleston, S. C. Fertilizer-distributer	813,881	Feb. 27	4715	1043	120	2659
Graaff & Company Gesellschaft mit beschränkter Haftung, W. (See Mikorey, Hans, assignor.)						
Graban, Hans E., New York, N. Y. Hammer for beating leaf metal	814,003	Feb. 27	4951	1095	120	2705
Grabscheid, Gustav, assignor to Phoenix Elektrotechnische Gesellschaft M. B. H., Berlin, Germany. Electric hand-cutting apparatus	809,796	Jan. 9	2381	492	120	556
Grace, John F., assignor to Henry L. Worthington, New York, N. Y. Condenser	809,679	Jan. 9	2171	449	120	509
Graefe, Adolph, Brooklyn, N. Y. Adjustable stand for flower-pots	811,712	Feb. 6	337	74	120	1561
Grahstrom, Dorothy B., administratrix. (See Grahstrom, Edward.)						
Grahstrom, Edward, deceased, Topeka, Kans.; D. B. Grahstrom, administratrix. Car-coupling device	808,651	Jan. 2	64	14	120	16
Grant, Caswell F., St. Louis, Mo. Railway-rail	811,055	Jan. 30	4966	1057	120	1240
Grant, Andrew W., assignor of one-half to L. E. Mallory, Bradford, Pa. Pipe-coupling	811,631	Feb. 6	199	42–3	120	1528
Grant, Andrew W., assignor of one-half to L. E. Mallory, Bradford, Pa. Pipe-coupling	811,632	Feb. 6	201	43	120	1530
Grant, David F., and F. A. Fox, Stamford, assignors, by mesne assignments, to Eisenhuth Horseless Vehicle Company, Middletown, Conn. Combined sparker and governor for gas-engines	809,889	Jan. 9	1921	399	120	455

Alphabetical list of patentees for January and February—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drfg.	Official Gazette. Vol.	Official Gazette. Page.
Graham, David F., and F. A. Fox, Stamford, assignors, by mesne assignments, to Eisenhuth Horseless Vehicle Company, Middletown, Conn. Valve-controlling mechanism for explosive-engines	813,043	Feb. 20	3036	668	120	2236
Graham, John. (See Friedman and Graham.)						
Graham, William S., assignor to Parlin & Orendorff Company, Canton, Ill. Planter	812,925	Feb. 20	2804	617–18	120	2186
Grant, Charles W. (See Leaning, Elklor, and Grant.)						
Grant, Jordan W., Portsmouth, Va. Pop safety-valve	810,201	Jan. 16	3213	665	120	785
Grant, Thomas, assignor of one-half to Michigan Buggy Company, Kalamazoo, Mich. Shifting thill	812,843	Feb. 20	2648	579	120	2151
Grasser, Augusta, *et al.* (See Grasser, William H., assignor.)						
Grasser, Jasper P., *et al.* (See Grasser, William H., assignor.)						
Grasser, William H., Leland, assignor of two-thirds to A. and J. P. Grasser, Orofino, Idaho. Fly-trap	812,169	Feb. 6	1300	264	120	1754
Grattan, John W., Watertown, N. Y. Top	808,918	Jan. 2	587	129	120	129
Grau, Bernhard, Kratzwieck, near Stettin, Germany. Production of cement	813,965	Feb. 27	4574		120	2691
Graves, George W., assignor to D. D. Frisbee, Detroit, Mich. Apparatus for heating tires	810,538	Jan. 23	3943	811	120	982
Graves, John, Milwaukee, Wis. Loose-leaf-ledger binder	811,286	Jan. 30	5443	1135	120	1242
Gray, Alonso L., Vanderbilt, Pa. Mailing-tube	811,556	Feb. 6	35	8	120	1492
Gray, Frank, Muskegon, Mich. Reversible propeller	811,287	Jan. 30	5445	1135	120	1242
Gray, Horace A. (See Wibel, Cunningham, and Gray.)						
Gray, John M., Port Carbon, Pa. Ice-creeper	810,484	Jan. 23	3848	790	120	961
Gray National Telautograph Company. (See Tiffany, George S., assignor.)						
Gray Telephone Pay Station Company. (See Long, George A., assignor.)						
Gray, William, assignor of one-half to J. C. Robertson, Springfield, Mass. Float-valve	812,337	Feb. 13	1666	366	120	1905
Green, Alexandre M., New York, N. Y. Shoulder-form	810,332	Jan. 16	3491	721	120	844
Green, Alexandre M., New York, N. Y. Shoulder and sleeve form	810,333	Jan. 16	3492	722	120	844
Great American Automatic Vending Machine Company. (See Dole, Frederick J., assignor.)						
Great American Automatic Vending Machine Company. (See Wyatt, Albert E., assignor.)						
Green, Andrew L., Lake City, Fla. Bottle-seal	810,334	Jan. 16	3493	722	120	845
Green, George F., Basette, assignor of one-half to E. S. Jones, Kerens, Tex. Cooking-stove attachment	811,056	Jan. 30	4969	1037	120	1240
Green, James J., Bremen, Ga. Cultivator	809,942	Jan. 16	2666	550	120	672
Green, Stanley K., Baltimore, Md. Apparatus for detaching the heads from the bodies of sheet-metal cans	809,108	Jan. 2	977	202	120	216
Green, Stanley K., Baltimore, Md. Treating oxidized tinned sheets or surfaces	813,147	Feb. 20	3264		120	2287
Green, Willard R., Muscatine, Iowa. Absorbent bandage and material therefor	810,115	Jan. 16	3034	631	120	753
Green, Willard R., Muscatine, Iowa. Absorbent material	810,136	Jan. 16	3079	636	120	759
Green, Willard R., Muscatine, Iowa. Absorbent material	810,137	Jan. 16	3082	637	120	759
Green, Willard R., Muscatine, Iowa. Absorbent material	810,138	Jan. 16	3084	637	120	760
Green, Willard R., Muscatine, Iowa. Absorbent material and fiber-stock therefor	810,139	Jan. 16	3086	637	120	760
Green, Willard R., Muscatine, Iowa. Absorbent bandage	810,371	Jan. 16	3577	736	120	865
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,116	Jan. 16	3037	631	120	753
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,117	Jan. 16	3038	632	120	753
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,118	Jan. 16	3040	632	120	754
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,119	Jan. 16	3042	632	120	754
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,120	Jan. 16	3044	632	120	754
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,121	Jan. 16	3047	633	120	754
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,122	Jan. 16	3049	633	120	754
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,123	Jan. 16	3051	633	120	755
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,124	Jan. 16	3053	633	120	755
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,125	Jan. 16	3055	634	120	755
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,126	Jan. 16	3058	634	120	756
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,127	Jan. 16	3060	634	120	756
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,128	Jan. 16	3062	634	120	756
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,129	Jan. 16	3065	635	120	757
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,130	Jan. 16	3068	635	120	757
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,131	Jan. 16	3069	635	120	757
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,132	Jan. 16	3072	635	120	758
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,133	Jan. 16	3074	636	120	758
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,134	Jan. 16	3076	636	120	759
Green, Willard R., Muscatine, Iowa, assignor to American Absorbent Fiber Company, Portland, Me. Absorbent bandage	810,135	Jan. 16	3078	636	120	759
Green, William W., Newcreek, W. Va. King-bolt coupling	811,406	Jan. 30	5806	1216	120	1417
Greenaway Company. (See Marsh, Elon A., assignor.)						
Greene, George F., Detroit, Mich. Concrete or cement post or analogous structure	810,060	Jan. 16	2919	608	120	726
Greene, Glenn G., Warren, Pa. Hame-fastener	812,640	Feb. 13	2277	466	120	2032
Greene, Harry S., Woonsocket, R. I. Napping-machine	810,273	Jan. 16	3374	688	120	819
Greene, James G. (See Knupp and Greene.)						
Greene, William H., Prophetstown, Ill. Automatic device for photographic purposes	809,269	Jan. 9	1551	311	120	371
Greener, Charles T., Fazikton, S. D. Brush holder and scraper	810,640	Jan. 23	4189	889	120	1089
Greenfield, Edwin T., Monticello, N. Y. Mechanism for constructing flexible metal tubes and armoring flexible hose or other tubes	809,561	Jan. 9	1923	399–400	120	456
Greenky, Louis, New York, N. Y. Support for hoisting devices	810,274	Jan. 16	3374	688	120	820
Greenlaw, Warren A., Boston, assignor of one-half to W. W. Blair, Newton, Mass. Flexible joint for pipes	812,932	Feb. 13	1988	398	120	1943

Alphabetical list of patentees for January and February—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Drg.	Official Gazette. Vol.	Page.
Greenthaler, Frank, Guttenberg, N. J. Tar-lined leader and pipe	811,268	Jan. 30	5448	1135	120	1343
Greenwood, Ernest. (See Kip and Greenwood.)						
Greenwood, Jasper L., Hoboken, N. J. Latch	813,376	Feb. 20	3707	815	120	2379
Gregory, Charles W., Jr., Bristol, England. Compressible packing for wood-block road-paving	810,529	Jan. 23	3945	812	120	983
Gregory, Walter. (See Lafever and Gregory.)						
Gregory, Walter, trustee. (See Richardson, John S., assignor.)						
Grey, George. (See Heap and Grey.)						
Grey, James M., Burnley, England. Weft-replenishing mechanism for looms	810,406	Jan. 23	3891	759–61	120	924
Grey, Sylvester P., assignor to Machinery Exchange, Indianapolis, Ind. Furnace	811,557	Feb. 6	36	8–9	120	1492
Gridley, Albert T. (See Rudel, William F., assignor.)						
Griffin, Alvah M., assignor to New Process Steel & Wire Company, East St. Louis, Ill. Bale-tie machine	809,943	Jan. 16	2668	551–2	120	672
Griffin, Tobias C. (See Hatfield, Wallace O., assignor.)						
Griffin, William C., Verdigris, Nebr. Threader and cutter	811,774	Feb. 6	448	97	120	1583
Griffith, Horace S., Glen Riddle, Pa. Terry-loom	812,788	Feb. 13	2531	556	120	2081
Griffith, Lawrence, Yonkers, N. Y. Electric switch and signal apparatus	813,882	Feb. 27	4718	1044	120	2659
Griffith, Samuel N., Chicago, Ill. Railway-tie	812,991	Feb. 20	2937	647	120	2215
Griffith, William H., Worthington, Ind. Lifting-jack	812,128	Feb. 6	1182	259	120	1730
Griffiths, William U., Philadelphia, Pa. Flushing apparatus for outdoor water-closets	810,936	Jan. 30	4755	990	120	1192
Griffiths, William U., Philadelphia, Pa. Flushing apparatus for water-closets	812,992	Feb. 20	2938	647	120	2215
Grill, John, Jr., Franklin township, Summit county, Ohio. Fodder-binder	813,646	Feb. 27	4252	934	120	2559
Grillier, Georges, assignor to Automobile Importing Company, Chicago, Ill. Antivibration device for vehicles	809,501	Jan. 9	1815	374	120	433
Grimm, William. (See Elwell and Grimm.)						
Griswold, George W., Manomet, assignor to Standard Game and Toy Company, Taunton, Mass. Croquet apparatus	810,853	Jan. 23	4542	946	120	1114
Groff, John W., Albion, Mich. Ship's davit	810,854	Jan. 23	4543	946	120	1114
Grogan, Archibald, London, assignor to L. H. Webber, Onslow Gardens, England. Artificial hand	809,797	Jan. 9	2383	492–3	120	556
Gronau, William F. (See Reynolds and Gronau.)						
Gröndal, Gustaf, Djursholm, Sweden. Apparatus for magnetic separation of iron ore	812,170	Feb. 6	1301	284	120	1754
Gröndal, Gustaf, Djursholm, Sweden. Magnetic ore-separator	812,171	Feb. 6	1303	285	120	1755
Gröndal, Gustaf, Djursholm, Sweden. Magnetic separation of iron ore	812,172	Feb. 6	1304	285	120	1755
Gröndal, Gustaf, Djursholm, Sweden. Magnetic ore-separator	812,173	Feb. 6	1306	285	120	1755
Gröndal, Gustaf, Djursholm, Sweden. Manufacturing iron sponge	812,174	Feb. 6	1307	285–6	120	1756
Gronde, Louis J., Chicago, Ill. Invalid-bedstead	811,713	Feb. 6	340	74	120	1561
